A long-pending suit for a valuable mining property, located in Aspen, Colorado, has just been settled, not by the finding of a court or jury, but by an agreement come to between the parties contestant. This suit has excited great interest in mining circles, not so much on account of the value of the property in controversy, estimated at between ten and fifteen millions, as for the reason that the case involved the consideration of the Apex law in its application to mineral-bearing lodes. When we read the dispatch announcing that the case has been settled by compromise, we were almost led to exclaim: "Of course; how could it have been rationally disposed of in any other way, seeing the interpretation of this enigmatical law was involved in its settlement. Contemplating the judicial proceedings had in this case, there looms in our thought a cloudy and shapeless form, the incarnation of ambiguity, perplexity and doubt—a something growing out of the frantic efforts of the court and the jury to reconcile the irreconcilable and adjust the inadjuable.

Presumably this Aspen trial was attended by the incidents and events common on occasions of this kind, all here reproduced, maybe, in aggravated form. There was, we may suppose, the usual array of witnesses and experts on either side, the testimony of one set so nearly counterpoising that of the other, that it would be impossible for even the most experienced jurist to detect a preponderance either way, this diversity of opinion so going to every fact connected with or having the remotest bearing on the case. The frame of mind induced by attempts at reconciling these conflicting views and through long wrestling with this apex proposition, with its end-line and side-line commitments, were easier conceived than described. "Confusion worse confounded" fails to express it. Little wonder these litigants, after several years' experience in the courts, concluded to settle their differences in the extra-judicial manner related. And yet such defeat of legal remedies is not due so much to incompetence on the part of these legal functionaries or other defect in the machinery of justice as to the imperfections of the state itself, the very ground principle of which there is reason to fear is radically wrong. How could the judicial mind comprehend the incomprehensible, or the bewildered jury flounder in a sea of uncertainties arrive at an intelligent conclusion or any conclusion whatever?

The expediency of this so-called Apex law has, from the time of its enactment, been seriously questioned in the most authoritative quarters, some of those best qualified to judge of its fitness having condemned it in the strongest language. That its enforcement has in many instances been attended with great inconvenience and even much hardship, cannot be denied, nor is there much doubt but it is becoming generally unpopular with a large portion of the mining community. It may well be in fact, that in adopting this new and unusual method in taking up lode mining claims instead of the square location, as is the practice in all other countries, we grievously blundered. If so, the mistake, should it become clearly apparent, ought to meet with early correction.

William M. Stewart, Senator from Nevada, himself, by the way, author of this Apex Bill, introduced into the Senate a day or two since a number of amendments to the existing mining law, all judicious and much needed. We suggest now that he go further, and reconsider the policy of repealing this statute with which there is such wide discontent, and substitute in its stead the plan of square locations, that elsewhere has been so generally adopted and found to work so well.

THE Utah smelters are enlarging preparatory for an increase of business. The Mingo Furnace Co. have just finished putting in a 50-horse power Corliss engine, a pair of flange steel boilers of 60-horse power each, and Westinghouse incandescent electric light plant and a 25-horse power Westinghouse engine.

ALL the mills anywhere near Virginia, Nev., are now hammering away on Comstock ore, except the two California mills, which are awaiting certain alterations in their motive power. Although all the mills are at work there are still mines that are unable to obtain facilities for the reduction of their ores.

## Mining Keeps Well to the Front.

Thus far the present year's conditions have been generally favorable to the mining interest, the prospect now being that the output of hullion for 1888 will largely exceed that of any preceding year in the history of the Pacific Coast. Should nothing occur to change the favorable aspect of the situation, this is sure to be the case. From all parts of our mineral domain, encouraging reports come to hand. From Alaska to Mexico, and from mid-continent to the ocean, the mining industry is in a healthful condition, some branches of the business, more especially coal and copper, being unusually active and prosperous. Silver mining, under the efforts that are being made to relieve it from some of the obstacles that have long tended to depress it, is also looking up, its friends being encouraged to hope that these efforts, though some have already been defeated, will not all fail of their object. That the Lower House of Congress should, at the instance of the gold-bugs, have felt constrained to nullify the silver-issue provision of the Beck bill, has been a grievous disappointment to the advocate of the white metal. Despite all this endeavor to disparage silver, its constant growth in popular favor indicates an early revival in the business of mining for that metal. Though it may for a time continue to lag, there is little doubt but this industry will ultimately recover much of its former importance if its restoration be not complete.

Because land values in California are being advanced at an unprecedented rate, and greatly increased attention is here being paid to agricultural pursuits, it must not be inferred that the business of mining is falling into decadence or that our mineral products are suffering a decline. Even in this State, mining is undergoing a steady expansion; in fact, almost keeping even pace with our agricultural progress, while in most other parts of the Pacific Coast it continues the leading and all-sustaining industry. Deprived of this, the population of more than half the territory west of the Rocky mountains would wane year by year, and its wealth soon shrink to a tithe of its present proportions. But for their store of the useful and precious metals, Idaho, Montana, Utah, Arizona and Nevada, would have only their scanty pasturage and slender agricultural resources to relieve them from the imputation of being mere sage barrens that so long rested upon them. It is due chiefly to their mineral wealth that the legend "Great American Desert," formerly written over these countries, has since been expunged from the map.

While we have no idea that anything will ever occur tending to show that the confidence reposed in the agricultural resources of California has been misplaced, we appreciate that our mines are only secondary to our lands as sources of wealth, and that they will for centuries to come richly reward the capital and labor invested in them, and this with quite as much certainty as investments made in lands. Hardly more than a month ago it was calculated that we should this year gather a bountiful crop of the cereals in California. To-day the estimates, owing to an absence of the usual April showers, are reduced by a third, with a danger of further shrinkage before the reapers get to work. When the year shall have been ended it will be found that we have garnered of gold, silver, coal, lead, copper, borax, quicksilver, etc., the expected crop, which not only in this State but in all the Pacific States and Territories, can with certainty be counted upon. While the grain-grower, the drouth having done its worst, lives still in dread of "the north wind's breath" and the danger of insects, hogs and worms, coupled with the rabbit and the bird pests, and innumerable forms of plant disease fills the mind of the viticulturist and horticulturist with apprehension, the miner, relieved from these fears and little dependent on the seasons for success, contemplates the future with little anxiety, well knowing that while there may occur individual cases of failure, good results are assured as a whole.

SENATOR STEWART has introduced a bill to require the purchase and coinage of not less than \$4,000,000 worth of silver bullion per month.

C. H. AARON is looking at the Julian, Banner and Cuyamaca gold mines, San Diego county, in the interest of the State Mining Bureau.

## The Lower California Mines.

There has been so much published in the San Diego papers concerning the gold mines in Lower California, that the excitement concerning them is something more than local. But the stories from there are so sensational in character that people who have had any experience in such matters will not readily accept them without further inquiry. Ore worth "\$1000 a ton," old mines "which have yielded a million," a true vein "which experts pronounce far more promising than the great Comstock in the early days," etc., are all stock phrases which have been used in all excitements, and are used now in this. The rich gold field is said to extend over 600 square miles, and to have many valuable ledges. There are also dry placers. The country is sparsely populated, and the distances between towns great. The mountains are unproductive of food, and supplies must be carried.

There have been several "excitements" in Lower California, but none of them have panned out very well. It is to be hoped that this one will, however, though it is best for poor prospectors to consider carefully before they go. The people of the South are not by any means unanimous as to the richness or extent of the gold fields. The Julian (San Diego county) *Sentinel* says: "The late mining excitement in Lower California will soon be laid away beside the many fizzes dotting the pages of the history of mining booms. Any person with ordinary common sense ought to see the sordid motives that agitate these booms. No doubt there are large quantities of gold hidden away in the secret caverns of the Mexican mountains, but it has been there for some years, and it will stay there long enough for all to get front seats who want them, so don't be in too great a hurry. But we are a little anxious to know how the San Diego newspapers are going to descend from their high position in this dishonest scheme. It is said that the fine samples exhibited as coming from this new El Dorado were mined in the Pacific and Julian Mining district in this county."

## Electric Power.

The use of electric power is rapidly increasing. The San Francisco Tool Co. of this city, which started to furnish electric power with a small Keith dynamo, have kept adding to their facilities as demand required, and have just put in an 80-horse power dynamo of the same make. This is in addition to the others. They furnish power for several small factories within a few blocks of their works, and are now arranging to run elevators, printing presses, etc., where heavier power is required.

The California Electric Light Co. has been preparing to furnish power in addition to light for some time. The company is now furnishing electric motors, from one-horse power up to 100-horse power, in any part of San Francisco. The power is available for printing presses, manfactories, operating pumps for elevators, etc. There is no investment required by the user, as the company furnishes motor and attendance.

In Oakland a company has also been started to furnish power. The large presses of the Oakland *Tribune* are now run by electricity, and the *Times* is also utilizing it in its press-room.

For two years past the MINING AND SCIENTIFIC PRESS has been urging the mining community to take up this power for hoisting-works, mills, concentrators, pumping, etc. There are many places where it could be used to great advantage. A Pelton or Knight wheel or a turbine at any convenient water-power stream within a few miles of the mine or mill, would give all the power for the dynamos. There are hundreds of places in this State where this system could be utilized.

In cities and towns the power will be of great use to many manufacturing establishments, where a central station supplies the dynamos and motors. No fireman or engineer is needed. There is no coal-dust, fire risk, smell or smoke. The motor occupies little space and scarcely any attention. It is possible to have machinery at distances from manufacturing centers, and even in dwellings. We expect to see this electric power very generally utilized within the next few years. The expense is small as compared with steam in most cases.

## Bank Blasting.

In blasting gravel banks in such places as hydraulic mining is carried on in this State, the ordinary method is as follows: A drift is run in from the face on the bottom of the deposit a distance proportionate to the height of the bank and the character of the ground to be moved. From the end of this drift a cross-drift is driven each way, forming a T. The cross-drift is charged with kegs of powder, and the main drift is securely tamped by filling it up solid with the material which has been extracted, and the powder is exploded by a time fuse or electric battery. In some instances where the ground is "heavy and hard" several cross-drifts are made. The amount of powder used is determined by the position, character and height of the bank, a quantity sufficient only to shatter the ground being employed.

The arrangement of the powder chambers for a 1201-keg blast made by the Smartville Hydraulic Mining Company some years ago, is shown in Fig. 1 of the accompanying diagrams, taken from Bowie's "Hydraulic Mining in California."

X was a shaft 74 feet deep, from the bottom of which the main drift, A, was driven 185 feet. The cross drifts, B, three in number, were driven at distances respectively of 70 feet, 120 feet and 170 feet from the shaft, X. They extended each 20 feet on one side of the main drift, and 40 feet on the other side. The several drifts marked C are called "lifters." Each "lifter" was 15 feet long. The total length of the drifts aggregated 570 feet. They were 2½ feet wide and 3½ feet high. The cross drifts were charged with 1201 kegs (25 pounds each) of black powder. The main drift was securely tamped from the shaft to the first cross drift, a distance of 70 feet. The powder was simultaneously ignited by electricity at 12 different points.

The ground moved was 270 feet long, 180 feet wide, with an average depth of 100 feet. The cost of the blast was about \$6000.

At a blast in the Paragon mine, Placer county, where 700 kegs of powder were exploded, the arrangement is shown in Fig. 2. The main drift A was tamped for 75 feet from the near end, and the cross-drifts tamped 10 feet each way, a space being left in the lifters for the expansion of the gas generated by the explosion of the powder. The drifts were 4½ feet high by 5 feet wide, and the bank was 150 feet high. The blast was fired by electricity, and the ground covered by the drifts was thoroughly shattered.

At the Dardanelles hydraulic and drift mine, near Forest Hill, Placer county, a blast was made with 36,400 pounds of Judson powder (old), shattering about 500,000 cubic yards of cement gravel. The gravel bank had a face of some 1200 feet in length, with a height of 175 feet. This deposit reposed on a rising bed-rock. Five parallel drifts, 180 feet apart, were run in from the face of a length of 70 feet each. From the end of each of these drifts two arms (right and left) or crosscuts were driven 70 feet long, thus leaving a space of 40 feet between the ends of the crosscuts from the several main drifts. The powder, in 50 pound boxes, was charged in lots of 1000 to 1500 pounds in the different chambers. In each chamber three exploders were placed in the powder, each exploder being carefully connected by an insulated copper wire, with the main wires on the outside of the drifts.

The drifts were all well tamped with clay and boulders. The wires from the exploders connected outside of the main drifts with two copper wires from an electro-magnetic battery which was situated to the right and about 200 feet from the face of the bank. When everything was ready the blast was fired. The back-ground was raised bodily four or five feet, and the face was thrown forward. At the Blue Tent mine, Nevada county, in 1880, a bank 200 feet high was thrown down with 43,000 pounds of powder.

The Porterville Enterprise is a new journal published at Porterville, Tulare county. The publisher is Edward P. Dewey, for some ten years a faithful foreman and assistant foreman in our office. He has produced a good-looking paper, which shows noteworthy attention to local news. The paper is independent in politics, and is printed in a growing section of the great valley of California. We wish Mr. Dewey every success with his publication.

**HYDRAULIC NOZZLES.**—Hydraulic miners are, most of them, aware of the long-pending litigation between F. H. Fisher and Joshua Hendy, plaintiffs, and R. Hoskin, defendant, on the subject of "gists" for hydraulic min-

GEORGE OHLEYER has gone East in the interest of the Anti-Debris Association, and presumably for the purpose of endeavoring to defeat the Biggs bill, introduced in Congress to provide for an investigation of the debris prob-

on the 29th of March decided that Fisher's reissued patent is void, and has ordered back the case to the United States Circuit Court with directions to dismiss the suit with costs to the plaintiffs. This decision is a very important one and will interest many miners.

gist Irelan are looking at oil prospects in San Bernardino county.

DURING the month of March Hale and Norcross shipped hullion valued at \$144,211.24, of which \$71,490.22 was in gold.

## Reduction Works at San Diego.

The San Diego Reduction Works Co. has been organized, with a capital stock of \$50,000. The President is W. G. Rwenberg; Vice-President, T. J. Daly; Secretary, Richard Garvey; and Treasurer, J. D. Hanbury. The company has secured a lease of one-half of block 88, in Cleveland's addition, on Ninth street, and work has commenced. The grounds are 300 by 150 feet. The contract for the buildings is let. A portion of the machinery for the new smelting and reduction works has already arrived, a smelter is already on the ground and a five-stamp sampling mill is now on its way.

A blast furnace is to be put up on the Coronado beach, to work ore from iron beds on the Atlantic and Pacific road, about 200 miles from San Diego.

The smelting furnaces of the Reduction Works Co. are intended, so it is said, to work copper ore from the mountains back of San Diego.

The people in the southern part of this State are very enterprising, and it is possible that these new works are adjuncts to the mining boom recently caused by gold discoveries in Lower California. Up in this part of the State we have been unable to make any money smelting iron, even with big capital, and furnaces right alongside of the iron-ore beds, and in San Diego they are going to haul the ore a couple of hundred miles, and fuel must also be transported. Furnaces for smelting copper are generally put up close to the mines, but in this instance the ore must be brought to the furnace, as there are no properly developed copper mines in that county. There is plenty of copper ore in Lower California, and perhaps that is to be utilized. Information concerning the whole plan is not very accurate, as we are told by the dispatches that the little mill mentioned above is to crush 50 to 100 tons of ore a day. We can't make five-stamp mills do anything like that in the upper part of California.

## Modern Dwellings.

We give on this page engravings of some of the types of dwelling-houses now being built here. These residences were designed by John J. Clark, architect of this city. Fig. 1 represents a building now being erected in East Oakland. It is a two-story, basement and attic frame, and contains 12 rooms, consisting of parlors, reception-room, library, kitchen, dining-room, chambers, etc., and necessary chamber closets, pass closets, chute, dumb waiter and all necessary modern improvements. The total cost, when ready for occupation, will be \$8200.

Fig. 2 is a building that was erected last summer in Ross valley, Marin county, at a total cost of \$6000. It is a two-story frame with basement and attic, and contains 12 rooms, the first floor containing parlor, sitting-room, conservatory, dining-room and kitchen, the second floor containing the chambers, bath and dressing-rooms. The basement and attic contain the coal-room, storerooms, servants' and trunk-rooms, respectively. The house contains all the latest modern improvements and is designed in the Queen Anne style of architecture.

Fig. 3 is a city residence erected on Oak street, San Francisco. It consists of 12 rooms, with all the modern improvements, and was erected at a total cost of \$6120. These engravings were made by the San Francisco Journal of Commerce.

SEVERAL HUNDRED miners employed in the Con. California and Virginia mine gave a farewell send-off to William W. Harper, foreman of the above mine, who left with his family for the Broken Hills mining district, South Australia, in response to a cablegram from W. H. Patton, late superintendent of the Bonanza mines. Harper was presented by the miners with a gold-headed cane with a diamond setting.

The Comstock has been regarded as dead a half dozen times, but still it rallies, and this time with more real merit, perhaps, than it ever had before. Tuscarora and Enreka have each passed through like dark days, but both are again showing great mineral wealth. But the Comstock is the wonder of all mines of which the world's history furnishes an account.

EARTHQUAKE shocks were felt at a number of towns in California on Saturday last.

## MECHANICAL PROGRESS.

## The New Puddling Process.

Further Advance in Iron Manufacture—Another American Invention.

We have already made brief allusions to a new puddling process by which the iron is made to pass directly from the blast-furnace to a machine puddler where it is puddled and converted into blooms without any reheating. For some four or five months the experiments with this new process have been in progress at the Milwaukee works of the North Chicago rolling-mill.

The successful use of a similar direct process in the South Chicago Steel Works, says the *Iron Age*, led the officers to believe that it would be feasible in the puddling department of their Milwaukee iron works. It was no more necessary, they argued, to remelt iron for a puddling furnace than for a steel converter. At first one puddling furnace was tried, with satisfactory results, then an additional furnace was used, and in time others were added, until there are now, and have been for two weeks, four double puddling furnaces in regular operation upon this plan.

The results thus far accomplished have been very satisfactory, showing an improvement in every respect over the old method of operating puddling furnaces. The quality of the iron produced is most excellent. No difficulty is experienced in securing a uniform quality of metal from the blast furnace.

So far as known this is the first successful attempt in puddling blast-furnace metal, and the North Chicago Rolling-Mill Company may well feel proud of their achievement. They have inaugurated

## A New Departure in Puddling

Which is fully as important in its way as the revolution of the rail trade in this country, in which they were also the leaders. On the 24th day of May, 1885, this company rolled the first Bessemer steel rail ever rolled in the United States. The officers of the company feel that they have accomplished a very important step in the manufacture of iron, and one which will assist it to hold its own against the inroads of soft steel for purposes to which iron is well adapted. The company is not yet prepared to furnish a full statement of the results developed by the new process in comparison with the old.

## The New Process Described.

The following is a brief description of the new process, as described by one who is evidently familiar with the same: The liquid metal is brought from the blast-furnace to the puddle-mill by a small locomotive. The ladle holds about 4400 pounds, which is enough to charge two puddling furnaces. The metal retains its heat sufficiently, so that there is no risk of damage if there happens to be some little detention on the way. The ladle at present is mounted on an iron frame boggy, tilted by means of gear. A scale has been arranged on the boggy, so that the contents can be almost accurately weighed when pouring. The metal requires about an hour for the complete process of making ten balls. By the old way it requires two hours. The time occupied for the usual five heats of a turn is now just eight hours. At present but two turns are made in 24 hours, but it is probable that in time, should it become necessary, three turns can be made, which will increase the output 50 per cent.

There seems to be no special difficulty in working the new process. The surplus metal at the blast-furnace is run off into the pig beds once a day, and seems to be of as good quality as before the direct puddling process was introduced. Sufficient data have not yet been obtained, but it is estimated that thus far a saving of nearly one-fourth of the fuel used by the old process has been effected. It is expected, however, that the saving will eventually be greater than this when the workmen get thoroughly expert in the new form of puddling. The metal thus far obtained is much cleaner than by the old way, owing to the fact that pig iron takes up considerable sand from the beds in the casting-house. The tests of bar iron made from the new process have not been completed as yet, and no report can be made. This new puddling process is attracting much attention all over the United States, and in Europe as well, as will be seen by the following item which recently appeared in the *London Iron and Trade Journal* under the head of

## The Decline of the Puddler.

While we are not among those who think that the decline of "fistic" abilities among the English people is a sign of increasing milk-sopism, we are always pleased to note any change in machinery or system that tends to make men less and less machines of the monotonous drudgery kind. Many kinds of manual work are about as unvarying as the tread round of a gin-horse, while other handicrafts are unsuitable for human beings. Among the latter description we notice that Sir Charles Palmer classes the occupation of puddler. Speaking of progress of steel, he remarked that they had come to the conclusion that steel had superseded iron, and the old puddling system was entirely, or almost entirely, done away with. He could not regret the dispensing with the puddler, as he would rather see him elevated by education, improved by science, and made a first-class intelligent skilled workman than put before the

furnace and roasted until his constitution was destroyed. This is all very nice from a philanthropist's point of view, but we should prefer to see progress delayed rather than have it stimulated by sentiment. The puddler's work is heavy, but we deny that he is unskilled, and heat is not so serious on the health as the steel advocates assert.

**MAKING OLD STEEL RAILS NEW.**—Mr. W. B. Middleton, manager of the Penn Iron Works, Lancaster, Pa., has discovered a method of welding steel which promises to confer very great benefit upon those engaged in steel-working. According to specification of the invention, which has been patented in the United States and leading foreign countries, pieces of steel may, at a proper welding heat, be perfectly, cheaply and easily welded together after the pieces to be welded have been coated with a solution of silicate of soda or other solution in which silica is contained. In the practice of the invention, the most satisfactory results have been obtained by applying a solution of silicate of soda to the pieces of steel to be welded, by dipping the pieces in the solution, or by pouring it upon them, bunching together the pieces to be welded and heating them to an ordinary welding heat and then passing them through rolls. This is the process followed with large pieces, but smaller articles can be welded under the hammer when treated previously with the solution. The inventor finds that the process is applicable for reworking old steel rails and other heavy pieces; and it renders certain kinds of steel scrap highly valuable which formerly were almost worthless. Experiments under the process have been made on an extensive scale at the Penn Works, and the results indicate that something like a revolution in the manner of handling old steel is pending. Arrangements are making to treat masses of steel with the silicate solution on a large scale, place them in the heating furnace, and then pass them through the rolls, thereby turning old rails into new ones that will be as good as the first product of the steel ingot. The inventor of this valuable process is a brother of Mr. Harvey Middleton, superintendent of motive-power of the Louisville and Nashville Railroad.—*National Car and Locomotive Builder*.

**A NEW PROCESS OF ELECTRICAL WELDING.**—A new system of electric welding has been perfected by Dr. Bernardo of St. Petersburg. The process of electric welding hitherto practiced for joining bars, etc., is the device of Prof. Elihu Thomson of Boston, Mass., and depends upon causing the bar to be traversed by an alternating current of electricity powerful enough to fuse the metal at the point of resistance caused by the break of continuity. In the new system, however, a continuous current from a charged accumulator is employed. The metals to be joined are attached to the negative pole of the accumulator, and a carbon pencil, such as is used in ordinary arc lamps, is connected with the positive pole of the battery. The result of bringing the carbon pencil into contact with the metal, and then slightly withdrawing it, is to start an electric arc, which fuses the metals at the desired joint until they run together. Carbon blocks may be used to retain the molten metal in its place, and sometimes a little sand is used as a flux. In this way boiler plates can be welded in situ, blow holes in castings filled up and iron rods joined. Thus it appears that the new welding process is very like lead burning, the carbon pencil in its portable holder playing the part of the gas blow-pipe in the latter process. It remains to be proved by tests whether this system is good for working with, or whether it is destined for shop and foundry use in doctoring flawed iron work.

**NEW METHOD OF MELTING IRON.**—A new method of melting iron has been devised in Germany. The cupola is supplied with blast through two tuyeres, one above the other, there being 18 in each set; the tuyeres are ports, with the form of a vertical slot, and are directly connected with a tuyere ring. The particular feature of the cupola is that the bottom is a slightly inverted arch, which is pierced by two openings, through which both blasts, or rather imperfectly consumed gases of combustion and the fluid, can flow. Below is a small chamber in which the iron collects. It is heated by the gases forced downward from the cupola above, these being supplied by the necessary air for combustion by a special tuyere leading to the main pipe, the chamber at the same time serving to pre-heat, scrap, etc., which need only to be pushed into the bath for dissolving it. Of course, considerable quantities of scrap can be used by directly charging an ordinary cupola, but it is claimed in this case the advantages presented are economy of fuel, and a greater facility for making sharp, strong castings, and a purer description of metal.

**SHAFTS DISPLACING BELTS.**—Quite a number of factories in the East are discarding the use of belts to convey power from one floor to another. In their place they run a vertical shaft from the top to bottom of the building, connecting each floor by bevel gears on quarter-twist belts. This is done to prevent accidents from clothing catching in belts; also prevents its forming a draught for fire. The shaft can, of course, be fitted in a box in the floor, with no place to catch skirts or aprons, and no air-passage for draught.

## SCIENTIFIC PROGRESS.

## Scientific Methods.

Scientific methods bear the same relation to intellectual progress that tools, instruments, machines, mechanical contrivances of all sorts, bear to material progress. They are intellectual contrivances—indirect ways of accomplishing results far too hard for bare-handed, unaided intellectual strength. As the civilized man has little or no advantage over the savage in bare-handed strength of muscle, and the enormous superiority of the former in accomplishing material results is due wholly to the use of mechanical contrivances or machines, even so, in the higher sphere of intellect, the scientist makes no pretension to the possession of greater unaided intellectual strength than belongs to the uncultured man, or even perhaps to the savage. The amazing intellectual results achieved by science are due wholly to the use of intellectual contrivances or scientific methods. As in the lower sphere of material progress the greatest benefactors of the race are the inventors or perfectors of new mechanical contrivances or machines, so also, in the higher sphere of intellectual progress, the greatest benefactors of the race are the inventors or perfectors of new intellectual contrivances or methods of research.

To illustrate the power of methods, and the necessity of their use, take the case of the method of notation, so characteristic of mathematics, and take it even in its simplest and most familiar form: Nine numeral figures, having each a value of its own, and another dependent upon its position; a few letters *a* and *b*, and *x* and *y*, connected by symbols  $+$  and  $=$ ; that is all. And yet, by the use of this simple contrivance, the dullest schoolboy accomplishes intellectual results which would defy the utmost efforts of the unaided strength of the greatest genius. And this is only the simplest tool form of this method. Think of the results accomplished by the use of the more complex machinery of the higher mathematics!

Take next the method of experiment so characteristic of physics and chemistry. The phenomena of the external world are far too complex and far too much affected by disturbing forces and modifying conditions to be understood at once by bare, unaided intellectual insight. They must first be simplified. The physicist, therefore, contrives artificial phenomena under ideal conditions. He removes one complicating condition after another, one disturbing cause and then another, watching meanwhile the result, until finally the necessary condition and the true cause are discovered. On this method rests the whole fabric of the physical and chemical sciences.—*Popular Science Monthly*.

**SPECULATIVE FANCIES.**—We have had the age of stone, of bronze, of gold, and of paper; the age of condensation may be looming in the future; and at a fashionable dinner party, some time in the 20th century, the entire menu for 20 guests may be put into an egg cup placed in the center of a table otherwise heaped with apparently natural flowers, but in reality artificial ones, scented by means of tabellæ of condensed odors, ravishing to the olfactory nerve, but extracted from the homeliest substances, such as tallow, Thamea mud, garlic, cow cabbage, eel and decayed fish. And when the guests have regaled sumptuously on *disca* representing hord-d'œuvre, eoup, fish, entrees, roasts, sweets and dessert washed down by sherry, claret and champagne *disca* dissolved in water, they may go to the play by means of the telephone, and listen to the songs of the Patti of the future through the medium of the phonograph. Some of the guests will, of course, fly home; others, more indolent, will step into their balloons or hail a passing parachute. So we may progress and progress, and continue condensing and condensing, until some day or other we condense ourselves, and become so many microscopic *disca* not much bigger than the grains of dust to which all humanity is bound to return.—*London Telegraph*.

**WHAT IS INSTINCT?**—The instincts are memories that have become organized in the central nervous system of the man or other animal, and which are transmitted from the ancestry as well defined as are the form, or features of the countenance, or the peculiarities of the thoughts and disposition. As may be inferred, the instincts are principally useful as conducive to the general welfare of the race or animal, but are cultivated only to a limited extent, and that with difficulty, as seen notably in the lower animals. Cultivation in man is something outside and not connected with the instinct—something which is not found at all in the lower animals and therefore cannot be improved in them.

**"WEATHER."**—Ralph Abercromby has written a book under the title of "Weather," which constitutes a popular exposition of the nature of weather changes from day to day. Weather science is now attracting a great deal of attention. The methods of forecasting the weather have themselves been reduced to something like a science. The meteorologist, by the aid of the telegraph, learns all about the prevailing wind currents, the temperature, the state of the barometer over a large area. He is able to predict the weather in a given place with tolerable accuracy for about 48 hours in advance. The book treats of cyclones, pâm-

peros, whirlwinds, tornadoes, thunderstorms and the sources of heat and cold. There are 96 illustrations. While the author aims at a popular exposition, most of the chapters are crowded full of data derived from all sources, ancient and modern. Indeed, all the known facts and phenomena are brought together and an attempt made at classification. The signal offices, meteorological offices and societies at home and abroad have been laid under contribution for data.

**GRANITE IN GLASS-MAKING.**—A glass sand company, up in the State claims to have successfully experimented in grinding granite obtained on the long range of the somber Shawangunk mountain, and the result promises to revolutionize at least one part of the glassmaking business. Heretofore a certain kind of sand has been necessary in making glass, but the experiments made show that granite is an excellent substitute. The company is fitting up its works, and several of the stones to be used as bed plates to grind the flinty granite to powder weigh over 15 tons each. Work has been somewhat delayed by the recent collapse of a bridge under the weight of one of the immense stones referred to. Two more of these immense stones have been hauled from the quarries in the mountains to a dock at Kerhonkson, and upon the opening of navigation on the Hudson and Delaware canal they will be taken there by boat. The Shawagunks have a national reputation for the millstone product, but 15-ton single millstones have never been used until now. The sand powder which is to be made from the flinty granite costs little or nothing.

**ORIGIN OF WESTERN TORNADOES.**—Of 600 tornadoes of which record has been made in the United States, not more than 75 were east of the Alleghany mountains. These terrible displays of natural energy result from the excessively warm air of the lower Mississippi valley being violently forced northwardly until it meets with a similar violent movement of air coming down from the polar regions. The two rapidly moving currents on meeting are forced into gyrotory tornadoes, of limited extent, which sweep with destructive violence across the level prairie country where they meet. The place of meeting is oftener in Missouri or Kansas than in the region further north. But wherever such opposing violent winds meet, a tornado of more or less violence is the result. The Alleghany mountains serve as quite an effective barrier against storms of this description on the Atlantic Slope.

**COMPRESSED WOOD.**—An account is given in the Nevada papers of some beautiful specimens of solidified pine wood which, strange to say, were taken from the 1500 foot level of one of the mines in that country. The wood, having been compressed by the operations of nature to one-fourth its normal size, is as firm and close-grained as boxwood, and consequently takes a fine polish. On being thus treated, it appears and feels so exactly like petrified wood as to be at once mistaken for such on being seen and examined for the first time. The material, when polished, is of a deep chestnut color, and, though brought to its present condition by exposure to 160° of heat, under immense pressure, for a period of some 12 years, it is thought that the same effect might be brought to pass in a few days by means of suitable processes of compression, and the substance made serviceable in useful industries.

**SOME OF THE LESSONS OF THE STORM.**—The recent storm, by which New York City was cut off from intercourse with the rest of the world, afforded a striking reminder of the intimate connection between labor and subsistence, and should be a valuable object-lesson for those who are disposed to despise labor and defy mere wealth. A practical demonstration was afforded of the fact that the man who possesses millions in the form of bonds, mortgages, notes, etc., is only better off than his poorer neighbor to the extent that he may be able to secure actual and real values represented by them, and that if, for any reason, labor is rendered impossible or its immediate products unavailable, he is as helpless as the poorest; perhaps more so. The condition brought about by the storm need only have lasted a few days longer to have carried the illustration to completion.

**VELOCITY OF ELECTRICITY.**—There is, as Professor Thompson remarks, no assignable "velocity of electricity," as this must vary with the current and the conductor. Wheatstone, in 1833, seemed to show a transmission velocity of 183,000 miles a second through copper wire, but in late experiments signals were sent over ordinary telegraph wires on poles and had a rate of only 14,000 to 16,000 miles. With wires near the earth, the velocity was 12,000 miles, but reached 24,000 on very high wires.

**PRESERVING BUTTER.**—The export of butter to countries of which the climate prevents its home preparation has long been a hope in the chemical mind. This seems now to have become possible by a discovery of Pierre Grosfils of Vervier, who finds that a solution of a small amount of salicylic acid in lactic acid, when mixed with the butter, will keep it indefinitely without altering its properties or impairing its taste.

**THE FIRST ECLIPSE** upon record was a lunar one, and was observed at Babylon 721 B. C.

## GOOD HEALTH.

## Female Physicians in New York.

There are 150 female physicians in New York, and the number in Brooklyn and the surrounding cities about doubles that. Among those in New York City there are quite a number who have incomes of \$10,000; two or three make yearly sums ranging from \$15,000 to \$20,000, and one has averaged for the last four years a steady income of \$25,000. Dr. Emily Blackwell is the President of the Woman's Medical College, and has besides a large practice. She has adopted children and makes a charming home for them. Dr. Mary Putnam Jacobi has a large clientele, and consults with the first male physicians of the city; indeed more than one physician has a regular female conferee, to whom he recommends some of his patients to go for special courses of treatment. Several of these female practitioners are house physicians to hospitals, and the Lucretia Mott Hospital in Brooklyn is entirely officiated by them.

Some women physicians work in partnership with each other, among whom are Dr. Eliza M. Mosher and Lucy M. Hall of Brooklyn, and the two sister doctors, Sarah and Julia McNutt. Dr. Sarah has charge of the babies' ward of the Post Graduate hospital, and Dr. Julia has founded a training school for nurses. Both are physicians in high standing, and have a large practice, especially among children. Dr. Annie Daniels and Kate Parker are both women of influence and of the widest-reaching charity. Dr. Elizabeth Cushman is a celebrated anatomist and successful ovariotomist, and yet is a small, feminine, quiet-voiced little woman. Drs. Lozier, Post, and Faunce are all well known for good work. Without exception, these women are quiet, well bred, gentle-mannered and soft-voiced. One lonely young woman, whose physician was of the same sex, said a short while ago: "When I am homesick and miss my mother, I go and talk ten minutes to my dear doctor, and I come home quite happy again."—*N. Y. World.*

**A NEW TREATMENT FOR BOILS AND CARBUNCLES.**—In a communication to the French Academy of Medicine, at a recent meeting, M. Verneuil says: The topical applications (prominent among which stand the carbolated and borated solutions) employed in a certain way, and particularly in the form of powder used repeatedly and for a long time, are of remarkable efficacy, and at the same time are absolutely harmless and easy of application. These applications of powder, with few exceptions, arrest the progress of the disease in the gravest cases, ordinarily cause the pains to quickly cease, reduce the fever, disinfect the purulent and gangrenous centers, hasten resolution and promote the formation of healthy granulations. This treatment is suitable for all regions, and for all forms and periods of the disease. It is never harmful, and leads to a cure in a large number of cases. It assists surgical interference when that is necessary. Finally, it tends to prevent auto-inoculation and general infection.

**A NEW ANTIDOTE FOR RATTLESNAKE POISON.** On the morning of March 29th, says the *Indiana Farmer*, Mr. M. B. Smith, who works in a Southern Express office, at Atlanta, Ga., was bitten by a rattlesnake that lay concealed in a crate of cabbage. As he placed his hand upon the snake he felt a stinging sensation in one of his fingers and saw that a huge snake had fastened its fangs in his flesh. In a few seconds the hand and arm began to swell and Mr. Smith was driven hurriedly to Dr. Gaston's office. Dr. Gaston saw the young man was in danger of losing his life and he gave him a hypodermic injection of permanganate of potash—a solution of two grains to a dram of water. This antidote to snake poison was first used by a Brazilian physician, and its efficacy was so great that the doctor was given a handsome reward by the Government. The treatment relieved Mr. Smith immediately and he was sent to his home. From last accounts he was doing well. Dr. Gaston is of the opinion that Smith would have died but for the timely antidote administered.

**INSECTS IN EARS.**—Few troubles are more annoying or more productive of serious difficulty, if not removed, than insects in ears. Lying upon soft meadow grass, or sleeping upon a camp-bed of fragrant eucalyptus, bugs of different denominations seem possessed with a desire to inspect our auricles. Once inside, their frantic efforts to escape cause such agony that people have gone temporarily crazy with it. This may be instantly stopped by pouring the ear full of sweet oil, which suffocates the insect, and he is easily removed later by a syringe and warm water. Avoid intruding pins, etc., into the ear. Much harm may thus be done to their delicate mechanism, and little to the cause of all the trouble. If oil is not readily accessible, use water, which is almost as good. Earache in any form may be quickly relieved by filling the organ with chloroform vapor from an uncorked bottle, vapor only, not the liquid.

**HOT WATER TO RELIEVE THIRST.**—It is a mistake to suppose that cold drinks are necessary to relieve thirst. Very cold drinks, as a rule, increase the feverish condition of the mouth and stomach, and so create thirst. Experience shows it to be a fact that hot drinks relieve thirst and "cool off the body when it is

in an abnormally heated condition better than ice-cold drinks." It is far better and safer to avoid the free use of drinks below 60 degrees; in fact, a higher temperature is to be preferred; and those who are much troubled with thirst will do well to try the advantages to be derived from hot drinks instead of the cold fluids to which they have been accustomed. Hot drinks also have the advantage of aiding digestion, instead of causing debility of the stomach and bowels.

**NEWLY BUILT HOUSES.**—According to the *Medical Press and Circular*, at the town of Bihe, in Switzerland, a decree has been put in force prohibiting the occupation of houses within four months of their completion. As recently as the earlier part of the present century, in the north of England, custom, though not law, required the lapse of 12 months after completion before a house could be tenanted. It has been estimated that a modern brick dwelling of medium size requires about 10,000 gallons of water in its construction, much of which is still present when the workmen withdraw. Heat is of less use in getting rid of this moisture than free ventilation. We must not fail to add that to light gas in rooms with a view of drying them is a capital mistake, since all the hydrogen in the gas is converted into its equivalent of water, every part of hydrogen thus consumed yielding eight parts of water in the state of vapor.

**CHIEF CAUSE OF COAL MINE FATALITIES.**—Mine-inspector Williams' statistics for 1887, for the First Anthracite district, show that the main cause of mine fatalities is falling roof and coal, as the following will show: Deaths by explosion of gas, 6; by fall of roof and coal, 28; by crushed and run over by mine cars, 11; by explosion of powder and blasts, 3; by miscellaneous causes, inside, 7; outside, 11; total, 65.

**WATER IN THE GROUND.**—Extended observations at Paris and at Munich indicate that the sanitary condition of a locality depends on the amount of water contained in the ground. The years in which there has been a large quantity of ground-water present have invariably been the healthiest, while those in which there has been a smaller quantity have invariably been the unhealthiest.

**THE HOT-WATER CURE.**—The results of the hot-water cure are said by a physician to be the stimulation of the stomach at first, but after repeated use a lessening of the tone of the digestive tracks, which causes constipation and dyspepsia. Hot drinks tend to lessen bronchial irritation, and may be used profitably in some cases of consumption.

**RAILROAD ACCIDENTS.**—A French writer says the percentage of deaths and wounds from railroad accidents is only about one-quarter as great in Europe as in the United States.

## USEFUL INFORMATION.

**PROFESSIONAL DUSTERS.**—That dusting has been made a difficult household art by the accumulation of bric-a-brac in our houses, says the *Boston Journal*, is proved by the new occupation of bric-a-brac cleaning. It is known that in New York, women who clean ornaments go from house to house, making a remunerative employment for themselves. They possess a delicate touch, and have especial brushes for the purpose. The chief fault of amateur dusting is the haste with which it is done. Look at the duster in a large crockery store. She wipes each article with a cloth, carefully and slowly, and when necessary, polishes the surfaces thoroughly. Her leisurely manner is in great contrast with that of the average housemaid, who whips her cloth rapidly over the surface. A visitor to Holland says that the weapons of a Dutch cleaning woman are cloths and chamois, "brooms and brushes, scrubbing brushes for the floors, hair brushes for the wainscots, feather brushes for the walls, tooth brushes for the corners, geese wings for the stoves, hens' feathers for cleaning out the keyholes, small sticks of wood for poking the dust out of cracks in the floors." It is no wonder that the Dutch house is harnessed brightly.

**UTILIZING WOOD.**—The recently-invented process by which wood is made to take on some of the special characteristics of metal has been turned to practical account in Germany. By this process, the surface becomes so hard and smooth as to be susceptible of a high polish, and may be treated with a burnisher of either glass or porcelain; the appearance of the wood being then in every respect that of polished metal, having, in fact, the semblance of a polished mirror, but with this peculiar and advantageous difference, namely, that, unlike metal, it is unaffected by moisture. To reach this result, the wood is steeped in a bath of caustic alkali for two or three days together, according to its degree of permeability, at a temperature of between 164° and 197° Fahr. It is then placed in a second bath of hydrosulphate of calcium, to which a concentrated solution of sulphur is added, after some 24 or 36 hours. The third bath is one of acetate of lead, at a temperature of from 95° to 120° Fahr., and in this latter the wood is allowed to remain from 30 to 50 hours. After being subjected to a thorough drying, it is in a condition for being

polished with lead, tin or zinc, as may be desired, finishing the process with a burnisher, when the wood apparently becomes a piece of shining, polished metal.

**A DEAD BLACK PAINT.**—Probably many of our readers, especially those who are the possessors of optical instruments, have, at some time or other, been in need of a "dead-black" paint or varnish for brass work, such as tubes, diaphragms, etc. We have often been in the same boat, and all the formulae and recipes given in the books were unsatisfactory because of their vagueness. The following can be relied upon to give a first-rate dead-black, and it is easily made: Take two grains of lampblack, put it into any smooth, shallow dish, such as a saucer or small butter-plate, add a little gold-size, and thoroughly mix the two together. Just enough gold-size should be used to hold the lampblack together—about three drops of such size as may be had by dipping the point of a lead pencil about half an inch into the gold-size will be found right for the above quantity of lampblack. It should be added a drop at a time, however. After the lampblack and size are thoroughly mixed and worked, add 24 drops of turpentine and again mix and work.—*Mechanical and Milling News.*

**A FULFILLING SOAP.**—Take 50 pounds of pure caustic potash and add to it about 90 pounds of water. The potash will dissolve immediately and make a hot lye. Allow this to cool. Add this lye with constant stirring for a few minutes until thoroughly mixed, to 20 gallons of cotton-seed oil mixed with 20 pounds of melted tallow, the whole being brought to a temperature of 90 degrees F. Then leave this mixture in a warm room for two days well wrapped up, to keep in the heat caused by the gradual process of saponification and combination which takes place. Again stir the stiff mass and leave for a day or two more in a warm place, when the saponification will be complete, and the result a stiff soft soap, nearly neutral, ready for use.

**A NEW NON-INFLAMMABLE MATERIAL.**—Pyrodene is a new liquid which renders wood, textile fabrics, paper and such inflammable materials fire-proof. The liquid is made of all colors, so as to be used as a substitute for paint; and it is said to render houses and out-buildings fire-proof. It was used for fire-proofing the woodwork of the recent Jubilee Exhibition at Manchester. Washable water-paints called "aqual" are also produced by the same inventor, T. Griffiths, F. C. S., and they can be applied direct to metal work. They contain no oil and may be washed with water, while, on the other hand, they do not blister in the heat of the sun. The paint is stated to be not more expensive than ordinary paint.

**EXPERIMENTS IN MARCHING.**—The experiment, begun some time ago in the German infantry, of doing away with socks and keeping the soldiers' feet well greased, has proved thoroughly successful. To say nothing of the economy of the plan, the men march easier, and, generally speaking, show few blisters. So, too, lifting the feet high; the regulation step now is said to make the most awkward Pomeranian or Hanoverian peasant fairly surefooted, while before its adoption 25 per cent of such men would stumble in a charge over rough ground, and about 10 per cent fall.

**THE POPULATION OF THE PACIFIC COAST,** by a careful estimate, is set down as follows:

California	1,250,000
Oregon	270,000
Washington	150,000
Nevada	75,000
Utah	200,000
Idaho	100,000
Montana	130,000
Arizona	90,000
Colorado	250,000
New Mexico	150,000
Total	2,665,000

**VALUE OF A BOBBY.**—The business man with a bobby that he rides is a happy man; but if the hobby rides him his business will suffer sooner or later. The man without a bobby will be found in the club room, the billiard-room or the card-room. The bobbyist, with his lot of pigeons, his birdskins or eggs, his bugs and beetles, takes more substantial happiness than all the members of the biggest-toned clubs in any city combined. Besides that, home and Dame Nature is all the world to him.

**A TRAIN OF CARS ON THE STAGE.**—The London *Engineer* tells of a theater there upon the stage of which steel rails are laid and a real locomotive draws a train of cars over them. The locomotive is steamed up, the engineer is at his post, and there are all the other accessories of a train of cars. What now perplexes the editor is to decide whether the man at the throttle is an actor or engineer.

**PENNSYLVANIA PETROLEUM.**—It is a singular fact that Pennsylvania petroleum, which was the first in the world to be developed, is superior to any that has since been found on any part of the globe. Compared with the oil produced in Northwestern Ohio, Canada, Russia or California, the Pennsylvania is far superior.

**TO PREVENT MILDEW.**—A solution composed of alum 2 pounds, water 60 pounds, blue vitriol 2 pounds, gelatine 1 pound, acetate of lead  $\frac{1}{2}$  pound, all thoroughly mixed, will prevent mildew from affecting wood, clothing, fabrics, etc.

## ENGINEERING NOTES.

## All-Rail Route to Asia via Alaska.

Russia is building two great commercial and strategic railroads through her Asiatic dominions. One of these roads is pointing southward through Afghanistan to—where no fellow can find out. Perhaps to the Arabian gulf or some other point on the Indian ocean, at present outside of Russian dominion. The other road is pushing eastward through the entire length of Russia in Asia, to some point on the Behring strait. The completion of this road would strongly hold out the idea that in the very near future a great iron belt from this side of the world will meet it half-way, and that travel by land from the New World to the Old will have been accomplished. Great railway corporations are now seriously looking into this, as it seems a stupendous project, but in reality not as great an undertaking as many people believe. The country that will necessarily have to be crossed in Western British Columbia and Central Alaska is far from being the frigid zone that many believe it to be. The line would undoubtedly, in its course north, strike the headwaters of the Yukon river, then keep down that mighty stream to within, perhaps, a hundred miles from the coast, at or near Nulato, where it would leave the river, and, running nearly west, would terminate at Cape Prince of Wales, within about 50 statute miles of the Siberian coast. A ferry across the straits at this point would be but a small affair.

Very little difficulty, except perhaps in crossing the ranges at the headwaters of the Yukon, would be apprehended from the deep snows in winter. The climate along the Yukon is dry and but very little snow falls there—from 18 inches to perhaps two feet in depth. Extreme cold, from 70° to 80° below zero, only prevails during about two months of midwinter, and this would be the greatest drawback to winter travel. Immense forests skirt the route nearly to the coast; about midway down the Yukon are perhaps the greatest coal banks in the world. Branch lines would tap the coast settlements and the rich mineral section of the interior. With such a fair country before them, remarks the *Alaska Free Press*, it would be wonderful indeed, in this enlightened and progressive age, if work is not commenced on such a line within a very short time.

**THE VALUE OF A GOOD ENGINEER.**—Quite a number of years ago an engineer took charge of a plant consisting of nearly a dozen engines, with over 2000-horse power of boilers. The plant was an old one, got together from time to time, according to the necessities of the concern, without much regard to economy either in its make-up, maintenance or operation. An agent was engaged for the concern who had sense enough to see that a good engineer could save a large amount of money in the power account, and a suitable man was engaged. He took charge, and although his salary was considerable, and his responsibilities much greater in magnitude than those of many who adorn an office, he put on his overalls and a slouch hat and went into that plant for all there was to be got out of it. He had old stuff to work with, and had to get along with what he had, but by a thorough study of the possibilities and the means at hand, and the application of sound practical ideas and common-sense methods, he reduced the expenses for power in that concern 42 per cent, and during his stay of nearly five years no portion of the mill was ever required to shut down or lie idle by reason of accident or failure on the part of any of the engines. He further submitted a plan for the rearrangement of the plant which would, figuring on a liberal basis, effect a saving which would pay an interest of 10 per cent on its cost.—*Ex.*

**THE PANAMA CANAL.**—It appears from late telegrams from Paris that De Lesseps is quite sure to obtain the sanction from the French Chamber of Deputies for his desired lottery scheme, which it is thought will furnish all the funds necessary for the completion of the Panama canal. The committee which has the matter in charge will make a favorable report, and advises that the canal company be authorized to raise 350,000,000 francs on the lottery plan. In the meantime active work is in progress on the Nicaragua canal, which will be completed some little time in advance of that at Panama. With these two water-ways between the two oceans, cheap freights and comparatively rapid water transit will be inaugurated, which will prove of immense advantage to California, and still further help on the new era of progress upon which the State has entered.

**A LONG TELEGRAPH WIRE.**—A very remarkable engineering feat has been achieved in China, in the face of extraordinary physical difficulties. It was the stretching of a steel-wire cable of seven strands across the river Lunann by the Danish engineer de Linde, assisted only by unskilled Chinese labor. The cable extends between two points at a distance of 4648 feet apart. The height of the first support is 417 feet above the present level of the river, and the second 737 feet. This Chinese cable is the longest in the world except one, the cable across the Kistna measuring 5070 feet. Two cables across the Gangee are 2900 and 2830 feet long respectively. Another, crossing the Hooghly, is 1312, and another in the United States, across the Missouri, is 2000 feet long.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**MIDDLE BAR TUNNEL.**—Amador Ledger, April 28: The big tunnel enterprise at Middle bar has come to a standstill with the prospect of a long period of idleness before it. The practical results from this huge undertaking are nil. A hole has been bored into the hill a distance of 2800 feet, at a cost of not less than \$100,000. This vast work has done absolutely nothing toward proving or disproving anything of practical value in the mineral development of that section. In the prosecution of mining upon the small veins which exist in that locality, the owners are just as much at sea as to the best and most economical method to pursue as though this tunnel did not exist. It affords no guide to others and has certainly proved only an expensive bore to the owners. It was run in the nature of a prospect tunnel, on a scale large enough for the operation of a great mine; but the mine has not yet shown up and the tunnel remains a monument to a foolish and costly experiment. If it has tended to prove anything, it is what was contended all along in regard to this peculiar mining district, namely, that gold-bearing ores are found in small but rich pocket seams. But whether any rich quartz ledge with well-defined walls exists here, as in other portions of the Mother lode, is a question still undetermined. The Zelle mill resumed operations last Sunday.

**SUTTER CREEK.**—The four men who took a lease of the Lincoln mine have abandoned their contract, as they could not find the pay rock that they anticipated. S. D. R. Stewart has just returned from San Francisco, and in all probability he will put some men to work on the mine in a few days.

**PLYMOUTH.**—The Consolidated mine is still waiting for the fire to go out. The New London is working as usual and all of the smaller mines in the neighborhood are busy.

#### Calaveras.

**REED.**—Calaveras Prospect, April 27: The Reed mine is expected to start up soon. It is rumored that parties from San Francisco will take hold of it and it will be thoroughly prospected. John Rich informed a reporter that H. P. Robinson, W. T. Trible and himself are working the O. K. mine near Whiskey Slide. They are putting up an adit to crush rock from their mine, and we expect to hear of a good cleanup in a short time. A shaft has been sunk 12 feet on the lead and a drift 80 feet along the vein. The quartz will pay on an average of \$20 per ton, and the vein is four feet wide. Mr. Rich had a few specimens of rock with which he showed free gold without the aid of a glass.

**SINKING.**—William Ellis and Henry Spinola have been sinking a shaft on Central Hill near the Lava shaft on the old Muller claim. They commenced about three months ago and a week ago last Saturday struck through the lava into the channel. A large stream of water drove them out before they could get a pan of gravel, and the following Monday their shaft had 50 feet of water in it. The shaft is 143 feet deep, and Mr. Ellis informed the reporter that they intended to get machinery and pump out the water and ascertain what there is in the channel.

#### Contra Costa.

**COAL.**—Martinez Item, April 26: We learn that a coal prospect is being worked and developed on the farm of Mr. Francisco Galindo, about one mile from Concord, an expert prospector being now engaged in opening the vein. It is stated that a superior quality of coal indication is observable at the surface, and confidence is felt in the opening up of a paying vein of good coal. The prospect will be made near the place where the earthquake of 1868 caused an upheaval of the earth and escaping gas burned the grass for some distance around the opening. It has been suspected since that date that a valuable coal deposit was underlying the farm. The prospect will be watched with considerable interest.

#### Inyo.

**AT LOOKOUT.**—Inyo Independent, April 26: At Lookout Frank Fitzgerald has quite a force of miners at work; they are all working under lease and are doing well. Murphy & McIntosh who have a lease of the Lookout mines are doing especially well. Not long since Montana & Farnsworth took a lease of the furnace and ore dumps for six months. In 22 days they took out \$10,000 worth of bullion, and concentrations valued at \$1340. The two men got half the total proceeds giving them quite a sum for their labor.

#### Placer.

**FOREST HILL.**—Placer Herald, April 28: Thos. Sheridan is developing a quartz mine which promises to be richer than any other lode ever opened on the divide. The Pride of the Divide is located nearly half a mile west of his house and below the ditch. Mr. Sheridan has run a tunnel 110 feet in length, tapping the ledge at the depth of 65 feet. The ledge on this lead is two feet in width and very rich. The Gray Eagle Co. is busy putting in a third boiler, the two boilers in place not being sufficient power to raise the water to the surface. The Centennial mill is idle. Four men have been put to work on the Union tunnel, in Ferrier's ranch, below Todd's valley. This tunnel is supposed to be on the Big Channel lead, which is now bonded to the French company.

#### Nevada.

**COLUMBIA HILL.**—Cor. Nevada Herald, April 27: There are eight men working at the Grant mine pushing ahead the tunnel in hopes of striking a rich chute of ore. In a recent crushing of ore from this mine the tailings assayed \$20 to the ton, while not enough of the gold was saved in the mill to pay for working the ore. The gold does not amalgamate, and it is supposed the ore is something like rebellious Meadow Lake ore, and that some process other than the one now in use will be needed to save the gold. Concentrators will be put in this spring, and it is hoped that by means of them the gold can be saved. In the El Dorado mine there are five men at work. A small stringer of almost solid sulphurets was struck in the tunnel a few days ago which leads the owners to think the ledge is not far off. The tunnel is now in 330 feet, and the work is being pushed rapidly forward. When

the ledge is struck, it will confirm the opinion of expert mining men that this is one of the best sections in the State for quartz.

**COPPER MINE SOLD.**—Grass Valley Tidings, April 25: The San Francisco Company's copper mine, at Spenceville, has been purchased by Chas. Pietzsch, a Spenceville merchant, and O. Woehler. The last-named gentleman formerly superintended the mine, which, however, has not been operated during the last two years. Pietzsch and Woehler propose to work the property more extensively than ever, a course that will result in prosperity for Spenceville.

**STUCK GOOD GRAVEL.**—Nevada Transcript, April 27: S. L. Blackwell and John Cline have just struck some splendid gravel in their drift mine at Snow Point, above Moore's flat. They got \$27.50 worth of gold from five carloads of gravel.

#### Plumas.

**GOLD LEDGE.**—Plumas National, April 21: The Gold Ledge quartz mine, at Poplar valley, under the able management of Chas. Tork, the superintendent, is making good progress. There will be quite a force of men employed in a short time. The Consignee mine will be started up in a short time. A tunnel will be run to tap the deep shaft. Matt Peterson and Arthur Toole have started a tunnel in McDermott ravine, above Long valley, with the expectation of striking a rich gravel channel. Wiloughby & Jones are running their tunnel at Gold Lake night and day, and expect soon to strike the ledge. The croppings prospect very rich and they expect to strike a bonanza.

**QUARTZ.**—Greenville Bulletin, April 25: The quartz development at Wolf creek is reported to be increasing in size and value. We hope for the development of a big mine there. The Arcadia mill is now running on ore from the Drury mine, crushing having begun last week.

#### San Diego.

**JULIAN DISTRICT.**—Sentinel, April 27: The Julian mining district is now in first-class trim for producing the biggest mining boom that has ever occurred in Southern California, but our mines are too valuable to break our necks in encouraging any such suicidal excitement. Prospecting has been going on here for some time in a quiet way, and instead of making a big hurrah about the rich finds that have been made they have been kept quiet for various reasons, but before a fortnight passes, there will be announcements made through these columns that will make the eyes of the old forty-miners glitter. But we don't want any two weeks' rush followed by a sickening lull. We have the gold to induce capital to open up our mines in a permanent way and we can give the proof of the pudding.

#### Shasta.

**FIVE STAMPS.**—Redding Free Press, April 28: From A. J. Woodward we learn that the Celestine Mining Co. have purchased J. P. Rander's mining interest in Grizzly gulch, and will at once put on a force of men for the purpose of developing the mine, and will shortly erect a 5-stamp quartz-mill. The shaft is 80 feet in depth, with good ore in sight all the way down. Geo. H. Knox has some fine prospects in the old North Star mine; he has opened up the old company's tunnel, which is 400 feet in length, and is now running a crosscut to tap the ledge. E. L. Melbourne has struck a rich spot in the bed of Grizzly gulch, which yields well so far as prospected. C. S. Barnes has commenced operations on the placer mine formerly owned by Dr. Bell.

#### Sierra.

**DRIFT MINING.**—Sierra Tribune, April 27: At the Gibraltar claim, located at the head of Canyon creek, four miles east of Poker Flat, the company is preparing to start a new tunnel which will reach the gravel channel in about 400 feet. A tunnel has been run 500 feet by the company, but it was found to be too high, and therefore, useless. The Gibraltar is one of the most favorably located claims in the country, and the owners are sanguine that the channel for which they are running, will pay immense profits when it is reached. The Sunnyside claim, which is located at the upper end of the Gibraltar line, is proving a regular bonanza. The dividend company, whose claim lies on the same ridge and above the Sunnyside, will start a tunnel this spring. The Forest Queen owners will also prosecute developments upon their gravel claim this season. Mr. C. Keller, to whom we are indebted for the foregoing information, anticipates renewed activity in drift mining all through the northern portion of the county this year.

**YOUNG AMERICA.**—Cor. Mountain Messenger, April 28: Spring is making its appearance among us. The lower lake is clear of ice, and Upper Sardine will be in a few days. Everything moves smoothly along here. At No. 2 the main tunnel will be through the hill in about 200 feet more. The stops look well and put out their usual amount of rock. No. 3 is and has been for some time running on the ledge that steadily enlarges and prospects very well. Grade for a track and tramway is being made at No. 3 for transporting the quartz to the mill.

#### Trinity.

**GOOD PROSPECT.**—Journal, April 28: Messrs. J. N. Ames and M. R. Newman have discovered a good prospect in the Deadwood district, on the ridge above Jacob Paulsen's adit. The ledge yields about \$50 to the ton, is of good size and between well-defined walls. They have run a tunnel in on the ledge about 30 feet, which taps it at a depth of 20 feet, and it seems to improve as they prospect and develop it.

**EAST FORK.**—Journal, April 21: As spring opens, the prospects for a lively and profitable summer in the East Fork mining districts grow unusually bright. A good wagon-road is being built to the mines, and will be completed in time for summer travel. Already there are quite a number of men in camp, working the mines and prospecting; and prospectors are going in daily. Work is progressing on all the older locations with most satisfactory results. The quality of ore now being taken out of the Hardscrabble makes that mine a valuable property. It is rumored that the Golden Chest is about to sell and that a stamp-mill will be erected on the mine. It is a good property. With the erection of mills and the investment of capital, East Fork is bound to take a high rank, as a bullion producer, among the quartz camps of the coast. The camp offers a fair field for the capitalist and the prospector; to the capitalist it offers

a good opening for investment with the prospect of large returns; to the prospector it offers a large belt of mineral land but slightly prospected. There is a good opening there for thorough prospectors, and the right kind of men are heartily welcomed. We predict for the camp a lively season and a development that will astonish the Silurians.

**EAST FORK.**—Trinity Journal, April 28: The owners of the Enterprise are running a tunnel lower down than the one in which they have been working, which will give them about 60 feet of stopping ground. The tunnel will be about 100 feet long. The ledge is about 12 inches wide and is looking well. They are at present working six men. The Ozark, owned by Day & Moor, is showing as well as ever, if not better. They are stopping out ore and will start up their adit in a few days. It is rumored that the owners will erect a stamp-mill on their property during the summer. The Golden Chest is being worked by a force of about 12 men, and more will be put at work as soon as the proper men can be found who are willing to work and understand the business. This will probably be one of the big mines of California within a few years. The stamp-mill which the owners will put up this summer will be running about the first of August, when developments will be more rapid. Mr. Geo. Bailey recently sold one-half of the Esperanza location to Mr. W. R. Bigelow. The ledge is now 18 inches to 2 feet and prospects well. They will commence a tunnel in a few days to run in on the ledge and prospect as they go. Many other locations are promising well, and the summer season will see some of them bloom into rich mines, without a doubt.

#### Tuolumne.

**HOISTING WORKS.**—Sonora Democrat, April 28: The Hunter property in Hunter's canyon is undergoing development, and at the same time the company is erecting hoisting works.

**ELECTRIC POWER.**—The Buchanan Co. is examining the Tuolumne river with a view to the establishment on the river of electrical or air compressor works. From the mine to the river at the nearest point, the distance is about 3 miles, and the power to run the mill, hoisting works and Burleigh drills can be readily transmitted over this distance, and practically applied. The cam shaft of the Black Oak mill broke last week, and therefore the mill was idle this week. It is being welded by Romans & Cowie. This machinery came from San Francisco in the first place, and it is at once apparent that mill and machinery men ought on the score of merit to patronize home institutions, as the machinery from below ultimately breaks, and finds its way to the Sonora foundry.

**BELCHER.**—It is reported that the Belcher company, near Groveland, completed a crushing of quartz last week, with the new Kendall mill, and that the quartz paid very well. What is urgently required in that section is water, either for steam purposes, or for motive power. There is no doubt about the excellent class of mines there, and by all means power to work them should be obtained.

### NEVADA.

#### Washoe District.

**YELLOW JACKET.**—Virginia Enterprise, April 28: Are shipping 95 tons of gold-bearing white rock to the Santiago mill daily.

**HALE AND NORCROSS.**—During the week have hoisted 1524 tons of ore from the 600 and 700 levels, and have shipped to the Nevada and Mexican mills 1395 tons. The stops are looking well. Have bullion on hand and previously shipped this month amounting to \$103,000.

**SAVAGE.**—Are extracting about 90 tons of ore per day of good quality between the 400 and 900 stations, and are shipping 70 tons per day to the Rock Point mill. Have bullion on hand and previously shipped this month amounting to \$32,000.

**BEST AND BELCHER.**—On the 425 level the winze has been sunk 18 feet; total, 58. The formation is quartz, showing value by assay. The west crosscut from the top of No 2 upraise has been advanced 20 feet. The formation is quartz and porphyry.

**CHALLENGE.**—The Challenge-Jacket west crosscut on the 1000 level is in 16 feet, and the face shows quartz of a very favorable character. The raise is up on the slope a distance of 62 feet, having been advanced 22 feet during the week.

**UTAH.**—The west crosscut from the top of the upraise has been extended 50 feet; total, 140. This crosscut has passed through quartz and vein matter showing some value. The face is now in west country rock.

**CROWN POINT.**—The 600 level south drift has advanced 12 feet during the week; total distance from the shaft, 463 feet. The west crosscut on this level is out 160 feet, having been advanced 20 feet during the week.

**SEGREGATED BELCHER.**—The south drift from the raise has not been advanced since last report, the work done having been directed to repairing the 1300 level drift, in which good progress is being made.

**IOWA.**—The McBee tunnel has been advanced 13 feet during the week, and have started a south drift in quartz and vein matter. Have about 50 or 75 feet to run to get under the pay chimney.

**GOULD AND CURRY.**—During the week have extracted from the 250 and 300 levels and shipped to the Douglass mill 80 tons of ore, the battery samples of which average \$31.95 per ton.

**BELCHER.**—The raise from the 500 level to connect with the upraise from the 400 level of Crown Point has made connection and crosscutting will commence from that point.

**KEYES.**—The east crosscut is in very favorable spot porphyry. North drift running parallel and near hanging wall is showing some rich ore, assays running from \$200 to \$400.

**CONFIDENCE.**—Are now shipping to the Brunswick mill daily 184 tons of ore, the average battery samples of which show a value of \$40.59 per ton for the week.

**ANDES.**—Are drifting east on the 350 level. The face is in quartz. Are still drifting north on the 240 level in low-grade ore, with occasional spots of rich stuff.

**SCORPION.**—The south drift on the 300 level has been extended 25 feet, making its total distance 213 feet. The face is in clay and clay porphyry.

**WEST CON. CAL.-VA.**—Are sinking shaft and

making good headway. Preparations for erecting steam-hoisting plant is in progress.

**BULLION.**—Are crosscutting east from the new station on the 640 level and making good progress.

**CHOLLAR.**—North drift No. 2, on the 450 level, is in 490 feet in low-grade quartz now.

**POTOSI.**—The southwest drift on the 450 level is in 332 feet in clay and porphyry.

**OVERMAN.**—Shipping 40 tons of ore daily to the Vivian mill. It is of fair grade.

#### Aurora District.

**PROSPECTS.**—Walker Lake Bulletin, April 25: The hoisting works of the Durand mine at Aurora are now in running order, the snow has entirely disappeared, the roads have all been repaired and Aurora will soon be one of the most prosperous mining camps in Esmeralda. In fact, the prospects are brighter for a prosperous future for Aurora than they have been for 15 years. It is true that there has been considerable excitement at different times within the last few years, but it was all without foundation. Now the mines are looking better and have more good ore in sight than they have had for many years; the people are all cheerful and hopeful, and feel that better times are in store for that once illustrious mining camp.

#### Bristol District.

**WORK.**—Pioche Record, April 24: It is expected that work on the property of the Bristol Syndicate, at Bristol, will soon be resumed. C. L. Roe, who, since last September, has had the property under lease, has surrendered his interest, and all indebtedness incurred by him under the lease is to be assumed by the syndicate, a majority of the creditors agreeing to this. Work is to begin at once and an experimental run will be made in about 10 days. If this is satisfactory other machinery will be put in the mill, and development on the Mayflower mine resumed. All the present indebtedness is to be paid from the first proceeds realized. About 1500 tons of ore are mined, part of which is at the mill, and several hundred tons more are broken in the mine and ready to raise. C. L. Roe expects to leave soon for Utah where he will engage in leaching tailings.

#### Eureka District.

**CHARGES FOR WORKING ORES.**—Eureka Sentinel, April 28: Quite a flutter of excitement was caused throughout Eureka district last Saturday, upon the announcement that the Eureka Con. and Richmond companies had entered into negotiations to raise the charges for working side ores. For some time past these companies have been pulling and bidding one against the other, in order to secure the side ore mined in this and the adjoining districts. Ores that were valuable as smelting factors, containing large percentages of lead, have been worked for a very small consideration, or nothing, beyond the margin of discounts on gold and silver. These companies claimed that the side ores were purchased at a loss to themselves, and have consequently agreed that hereafter all side ores that shall be purchased by them shall be bought on joint account and divided, share and share alike. Maurice Delaney, who has been employed for a number of years as sampler at the Eureka Con. reduction works, has been removed to a similar position at the Richmond works, to represent the Eureka Con. Co., where all the side ores, except the fluxes, are to be sampled and settled for. After sampling the half of each lot it is to be removed to the Eureka Con. works. From and after the date of the new arrangement between the two companies, the following are the terms upon which side ore will be worked by them: Twelve dollars per ton will be charged for working all dry and \$10 per ton for all fat ores, which contain lead. The percentages on the gold and silver contents of the ores will be paid for according to the rates that existed before the agreement, viz.: 81 per cent of the market value of silver, and 80 per cent of the assay value of the gold. The lead contents are to be paid for on a graduated scale. Nothing will be paid for lead when the ore contains less than 10 per cent, but for all ores containing 10 per cent and upward, from 20 to 45 cents per unit will be paid for all the lead contents over 10 per cent. As might be expected, the raise on charges has created a great deal of dissatisfaction in the community, especially among the miners who have ore for sale, and there are quite a number who have accumulated ore all through the winter, expecting to ship it as soon as the roads were opened, and they supposed that the prevailing terms on which the furnacemen were buying ore would remain unaltered. It is not surprising, then, that a great deal of disappointment is felt by those who were not able to get their ore in before the change was made.

#### Jackson District.

**PROBABLE SALE.**—Silver State, April 27: Negotiations are in progress for the sale of the Pennsylvania mine and mill to an Eastern company. John Catlow is the principal owner of the property, and it is said the parties have agreed upon the price to be paid.

#### Palmetto District.

**REDUCTION WORKS.**—Cor. Walker Lake Bulletin, April 25: The immediate establishment of reduction works at this place by R. B. Catherwood, successor to the old Palmetto Co., is no longer a matter of doubt, certainty having supplanted speculation. The plant consists of a mill of 15 tons capacity. Krome rollers will be used in reducing, and the Breckner furnace in roasting the ore. Lixivation is the process that will be adopted. John L. Powell, manager and superintendent of the mining enterprise, is the architect and builder of the mill. The mill will be set upon the site of the former one of the old Palmetto Co., and the mason work of the latter will be utilized. J. S. Knapp, machinist and engineer, will supervise the placement and running of the machinery. The mines are four miles distant, in a forest of nut pine, and consist of a group of 15 claims, 13 of which are covered by U. S. patents; two, the Brooklyn and Ajax, are recent locations. On the dumps of the President there are nearly 2000 tons that will yield by mill process: gold, 2½ ounces, and silver, 22½ ounces per ton. The greatest depth yet attained is 125 feet, from which levels have been run showing a ledge from two to four feet wide. The vein has been traced 1000 feet; openings have been at ten different points the entire distance, and the same type of high-grade ore is encountered at each place. During the last week ore of better grade has been taken out than heretofore. It is not extravagant to say that the ore now being taken out of this mine, by little as

sorting, will pay from \$200 to \$300 per ton. There are 17 men employed at the mines under the foremanship of Wm. Scott. The mill will be started up early in June. The success of this new enterprise will give a new impetus to Sylvania, six miles distant, a district rich in lead ore, and carrying a large percentage of silver.

#### Star District.

**SHEBA ORE.**—*Silver State*, May 1: William Woolcock, who is working the Sheba mine, is having ore hauled to Mill City for shipment. As the Sheba ore works from \$500 to \$750 per ton, a carload of it is quite valuable.

#### Tuscarora District.

**NORTH COMMONWEALTH.**—*Times-Review*, April 27: Work in the prospect incline advanced to feet. New prospect incline has been sunk 24 feet.

**COMMONWEALTH.**—No. 1 west crosscut has been advanced 23 feet. The formation is clay with some iron pyrites. No. 1 east crosscut from near the face of north drift has been advanced 19 feet. The formation is looking very favorable, and has the same inclination as the ore opened up in the upraise. The north drift from bottom of winze is turning out very fine ore. A drift has been started south from this same winze, and advanced 8 feet, also yielding good ore; average car samples from these two drifts for the week, \$275 per ton. The south intermediate has been advanced 10 feet in high-grade ore; car samples average \$890 per ton; the face is not looking quite so well; the ore will not average over \$500. A large amount of low-grade ore is being extracted from the drifts, which will pay well to concentrate; average assays, \$23.

**NEVADA QUEEN.**—A crosscut has also been started east, from the 219 north drift, and has been driven 8 feet, 250-foot level. The south crosscut has been extended 18 feet. The formation has been somewhat broken, but is becoming regular again. The ore taken from this level averaged \$241 per ton.

**GRAND PRIZE.**—South drift from west vein, 300 level, extended 26 feet; total length, 350 feet. The same promising vein continues as reported last week. Have started a west crosscut from south drift, 300-foot level. It is advanced 24 feet; the face shows seams of quartz that look favorable.

**NORTH BELLE ISLE.**—Connection has been made with the Little Six stopes from the 100-foot level of the Nevada Queen. It shows 65 feet in length of ore ready for stoping. The usual quantity of ore has been sent to the mill and dumps.

**PONDERE.**—South drift advanced 5 feet; ledge continues strong, but of low-grade; are not saving it at present. Progress is slow in this drift, owing to lack of facilities for handling the dirt.

**NAVAJO.**—West crosscut from the end of the south drift, 250-foot level, extended 9 feet. The stopes have yielded their usual amount and grade of ore.

**YOUNG AMERICA SOUTH.**—Upraise, 165-foot level north, up 60 feet. Have suspended work in upraise at present on account of air.

**NAVAJO QUEEN.**—North drift, 200-foot level, advanced 20 feet during the week, in very favorable ground. Rock breaks well.

**FOUND TREASURE.**—Stopes continue to produce the usual output of ore.

**BELLE ISLE.**—Stopes producing as usual.

#### ARIZONA.

**THE SENATOR MINE.**—*Prescott Journal-Miner*, April 25: The arrival of J. W. McGowan is the forerunner of active operations in opening the Senator mine, 11 miles south of Prescott. While East, Mr. McGowan succeeded in interesting capitalists in this great property. We congratulate Mr. McGowan on his success in making arrangements to operate this property, and also his associates for having secured so valuable an acquisition. There has been no mining sale for a long time in this vicinity possessing so complete an endorsement of the people, and of which there is such unanimous approval. We learn that it is contemplated to sink a new double-compartment shaft and drift under the old workings, and complete machinery for hoist and pump has been purchased. It is the opinion of all with whom we have conversed that when re-opened the Senator will prove one of the most valuable and productive mines in Yavapai county.

**HASSAYAMPA.**—*Prescott Courier*, April 25: J. W. McGowan returned from Hassayampa district yesterday. He examined some mines and appears pleased with them. Teams of Shull & Austin are hauling mining machinery, lumber, etc., from Prescott to Antelope, for A. L. Kerr. Water-pipe, concentrators, etc., were taken out yesterday. John Prout, the foreman at Copper Basin, will increase his force of miners. News from the mines causes all our people to rejoice. Chances are that the camp will soon be the largest in this part of the country. Talk is that 80,000 pounds of machinery and supplies are to be hauled out for Mr. Place, superintendent of the Moody & Place, in Bradshaw district. Jackson Killain, of Walker district, brought here yesterday a large lot of placer gold. F. W. Boggs, of the Boggs mine, Big Bug district, is here. Men are taking out ore, large lots of it coming to the sampler. Douglas Gray is putting up a new assay office at the mine.

#### COLORADO.

**NOTES.**—*Silverton Miner*, April 25: The Silver Bell at Red Mountain has resumed operations. The Duckyck sampler starts up on North Star ore on Monday. The Buckeye is preparing to ship as soon as the trail is opened. The Silver Bell at Ophir is doing well in the hands of its new owners. The Climax mine was sold this week to New York parties. The price was \$6000. The interest in mining this season will be divided between Arastra basin and Cement creek. Jack Pendleton has formed a company to work the White Elephant on Lookout mountain. The demand for pack animals this season promises to be far in excess of the visible supply. The Durango smelter will make a determined effort to control the San Juan output this year. The Aspen tunnel will reach the vein in the next two weeks, when the working force will be doubled. The Sheridan and Union mines in Marshall basin will send all their first-class ore by way of Silverton this year. The smelters of the State are bidding lively for the Green mountain mine output. It is heavy

lead ore they are after. Red Mountain is anxiously awaiting the completion of the Silverton railroad to send down about a thousand tons of ore that is now lying upon her dumps. The Emerald lessees report another strike in the lower level, and some fine-looking gray copper was brought to town yesterday. A carload is already on the dump. The ore dumps over at Ophir are crowded and the miners are anxiously waiting for the trail to be opened. The Montezuma, Parsons, and a number of other mines will increase their forces when shipments commence. Work on the Cleveland down the canyon will be started up shortly. The reported strike in the Sunnyside Extension was no myth. Four feet of free gold quartz worth \$500 per ton is about the size of it, and a carload a week will be the output when the trail to Eureka is opened.

#### DAKOTA.

**PARSONS.**—*Deadwood Pioneer*, April 20: Work with a force of three men was resumed a few days ago. Secretary Baggeley visited the property yesterday. From him we learn that already operations demonstrate that the ore vein encountered just before work ceased at the beginning of winter will prove of important dimensions. The ore, both carbonate and galena, is rich, assaying over 20 ounces silver and carrying a heavy percentage in lead. The financial condition of the company is flattering, considerable money and stock being in the treasury at present. A pump will shortly be placed on the property, when sinking will recommence. In the meanwhile, however, the force will be continued at work, drifting on the ore vein.

**TWO-BIT GULCH.**—If two or three good mines are not discovered and developed in Two-Bit gulch during the present season, it will not be for a lack of energy on the part of the prospectors. No district contiguous to Deadwood is at present receiving more attention than this. The prospector, with his pick, powder and fuse, is numerous in the canyon. Locations are being made every day, and a number of them present excellent promise. On one claim, located perhaps 700 to 1000 feet from the Parsons, the owner has met with the strongest and greatest encouragement. Yesterday, in looking for the lead from which certain pieces of float had come, he started a small open surface out. The first stroke of the pick into the soft and yielding ground disclosed a boulder of carbonate ore as large as a man's head. Incited to continue his efforts, another and another blow were as richly rewarded, until within a couple of hours, boulders of ore, aggregating in weight half a ton, were extracted. Considerable excitement was caused and confidence is entertained and expressed that a large ore body will be found before developments have progressed 20 feet further.

#### IDAHO.

**ELK CREEK.**—*Wardner News*, April 26: Work is being pushed vigorously on Elk creek group of mines, and Mr. Wardner engaged an extra force of men on Saturday, who commenced operations yesterday. On the Alma, two shifts are employed in the tunnel which is now in 40 feet and in the shaft which is down about 20 feet two shifts are also engaged. This claim prospects well. On the Alfar, the shaft is down 60 feet, and a similar force is kept at work. A full shaft of ore is displayed that prospects equally well with the Alma. The Nellie Woods has a shaft down 60 feet showing a vein five feet wide of decomposed ore. This is a remarkable showing, being all ore, no strata, averaging in value \$50 per ton. The prospect that Elk creek presents at present is most encouraging. The work of development is going on; 30 men are kept constantly employed and under the superintendence of J. Curry, work progresses rapidly and uninterruptedly.

**HENRIETTA.**—*Idaho Avalanche*, April 28: On Tuesday, we visited the Henrietta mine at Wagon town, where we found Mr. John Kent as foreman, who kindly escorted us around the hoisting works and ore-houses, and showed us a large quantity of rich ore. Some of the ore is very rich, while all will mill well. Though asked, we did not go down the shaft, where we could have seen a load of rich ore. Mr. Kent is opening up the mine in good shape, and will soon have it in condition to keep the mill running.

#### LOWER CALIFORNIA.

**MINING BOOM NOTES.**—*San Diego Union*, April 26: Reports of mineral wealth continue to come in, and the indications are that the Peninsula is almost an unbroken belt of gold and silver. Mr. Hughes, a well-known citizen of San Diego, who was in the mines on the gulf side five or six years ago, tells of the Triunfo mine, about 60 miles northwest of La Paz, the ore of which yielded \$700 to the ton. The San Antonio was almost as rich, but was flooded and is now idle. Mr. Hughes attempted to mine in that district but was compelled to desist on account of the effects of a poisonous weed which killed the mules used in the work. Mr. Miller, assistant superintendent of construction on the Hotel del Coronado, is an old miner from Arizona and caught the gold fever several weeks ago. He could not resist the inclination to get into the field and made a prospecting trip in the San Quintin country. He has just returned, bringing with him glowing reports and remarkably rich specimens. Only four miles from San Quintin three prospects panned 37 cents, 53 cents and 76 cents respectively, and he is satisfied that the entire placer is pay dirt. About 20 miles from San Quintin he secured a fine specimen of pure wire silver, which he says is by far superior to the famous wire silver of Arizona. He also brought up a lump of antimony which was obtained not more than 25 miles from San Quintin. The City of Puebla last evening brought down a party of 15 miners from San Francisco, most of them old fortune-hunters and veterans of the Comstock. They reported great excitement in the mining country above and said that the crowd has already started for the new diggings. They are bound for San Quintin and were in a hurry to secure their tickets on the Pacheco last night.

**ZARAGOZA.**—Prospectors are coming in rapidly, many of them going into the Zaragoza district. Nearly all are old experienced miners and say they never saw better indications, but agree that it is not a poor man's field. There is at least one good stream flowing 50 miners' inches in the Zaragoza

district. Several placers are being worked on its banks and the water can be flumed to a portion of the dry gulches. Careful estimate of the San Rafael river shows a flow of 250 miners' inches on the surface, and there is probably as much water in the bed as in the head of the San Diego river. It can be pumped to hills near the river bank and piped to the Castillo placers, giving hydraulic pressure. The field improves with inspection and appears to be very rich indeed.

#### MONTANA.

**FLINT CREEK DISTRICT.**—*Cor. Butte Miner*, April 21: The district is now feeling the effect of summer weather, and once more the bustle and activity characteristic of a mining camp on the approach of the mining season is exhibited. Prospectors are being outfitted for their summer wanderings. The mines under development are all looking well, but the depth necessary to show up the high-grade rock, for which this camp is noted, takes time. The San Francisco, one of this number, has now acquired a depth of 400 feet, where a station has been cut out and a crosscut begun. The vein is supposed to be some 40 feet from the shaft, and about three weeks' time will be necessary to show what they have got at this working. In the drift from the 200-foot crosscut, however, a body of ore was struck last week that is simply beautiful. Samples from this strike taken from the specimens now at the Kaiser house show it to run from 800 to 1100 ounces. The Combination at Black Pine is still prosecuting development work on the Royal Bounty, and also on the Combination claim, where they are extracting ore and piling it on the dump ready for the starting of the mill, which will probably be on the first of May. On the Royal Bounty claim, the recent discovery has proved even better than anticipated. A new syndicate of Butte men, consisting of Messrs. Pickens, Trask and another Butte party, has taken hold of the Buckeye lode, owned by R. H. Kinney, formerly of Butte, who has developed the claim by means of an incline shaft 60 feet deep and uncovered a 14-foot ledge at that depth, assaying from 22 to 30 ounces in silver and a small percentage in lead. The Teresa lode, located about 9 miles from the Burg, near Stone station, and owned by Dominic Mellen, Rory McKee and Will Albright, has now two shifts on driving the tunnel, which has cut several seams of rich quartz which are supposed to be stringers from the main ore body. The West Granite is not making much noise just at present, but is pushing work on the Butte crosscut, which has now about 200 feet more to run. In Dunkleberg district, Michell & Co. are working the Forest Rose claim, by means of an incline shaft, with great success. At about 230 feet a large pocket of fine ore, which runs above 100 ounces, was encountered. On the Cherry mine a prospecting tunnel has been started by Smith & Kirkendall, to develop that claim and the Tigen. The Hatto lode, now the property of the Hatto Mining Co., lately organized, made a strike of 2½ feet of rich quartz two weeks ago. On Dunkleberg there are now some 25 men employed, with a prospect that when the Hatto gets in full operation that number will be swollen to 40. The Bi-Metallic shipped two carloads of high-grade ore through the sampling-mill at this place, to the Omaha smelter during the week. From the Trout lead Jimmy Patten continues to ship manganese ore through the Phillipsburg sampler to Butte.

**ANACONDA.**—*Review*, April 26: Work in the mining district west of Anaconda has received a fresh impetus the past two weeks. The season being fully a month in advance of that of last year, and prospectors are earlier in the field. A new strike is reported in the Antelope mine in Olsen gulch, which is quite rich. The way the new ore-body was discovered was on account of a cave in the mine while the men were working, which uncovered a fine body of ore which was not suspected. The Silver Chain folks are taking out a small amount of ore, and are now hauling to town for shipment. The Ontario mine is surprising its owners considerably, the character of the ore being very much changed. It is now a rich carbonate, carrying a very high percentage of lead. It will without doubt prove a very valuable property. Cornelius & Brown are shipping iron ore to Butte from their silver-iron lode west of town. Parties in from the Lost creek district report an unusual amount of activity in that district. Work on the George mine at the head of Lost creek is still being prosecuted, and a small amount of ore being taken out. The snow still prevents parties from going out or in much, as everything has to be packed in nearly two miles. The Blue-eyed Nellie mine is looking exceptionally well, the owners are now taking ore out of the new drift and it is richer than ever before. The company still continues to ship to the Omaha and Grant smelter. At the Cable the sinking of the three-compartment shaft has reached a point 200 feet below the tunnel level. Johnny Cosgrove and partners are pushing work on the Little Nellie claim. The shaft is now down 95 feet.

**ACTIVITY.**—*Phillipsburg Mail*, April 28: A marked increase of activity in mining circles is the feature of the week. The possibility of working profitably the small prospects in the gulches having been demonstrated by H. L. Hoyer in the Blackmail and Scratchall, applications for leases are numerous and new locations are also being prospected for. A strike on the Gladstone is reported in the shaft. The ledge is five feet in width, almost all of which is ore giving an average assay of \$50 per ton. An assay of a choice piece gave \$1600. The Gladstone lies on the left hand side of Camp Creek gulch just west of the Northwest mill, the vein striking northeasterly and southwesterly.

**SAN FRANCISCO.**—In the east drift of the 200-foot level the streak has widened to five feet of big-grade ore of a quality equaling any that has been uncovered since work began. It carries native and ruby silver in abundance, and is of an even grade of richness over the entire five feet. At the 400-foot level the vein was tapped last Thursday at a distance of 16 feet from the shaft (printed 716 feet by mistake in our last issue), and drifting to the west is now under way. A streak of ore about 26 inches wide has been encountered in this drift, and the rock is of even better quality than that just discovered in the upper level. The condition of affairs at the San Francisco are now such as to make it a matter of little doubt that a mine of great and permanent value is developed. Already in both the 100 and 200-foot levels there are large bodies of ore ready

for stoping, and without further development sufficient ore could be extracted to considerably more than pay for the work already done.

#### NEW MEXICO.

**TAILINGS.**—*Silver City Enterprise*, April 27: At odd times the Bremen mill is working on 3000 tons of tailings purchased from the Flagler works. The Peerless was bought in for \$500 by A. F. Shapleigh, who held the \$5000 mortgage under which the sale occurred. The Standard mill and mine at Gold Hill will resume operations in a few days. The mill will treat custom ore for the camp. Sixteen tons of ore from Bald mountain is being milled at the Bremen by Willis James and James Woodward, lessees of the mine. It runs well. Wm. Gessner has leased from T. N. Childers the Bear Chief, Horn Silver, the "87" and ¾ interest in the "49," Bear mountain district. He has also taken a \$5000 bond on the property. Mrs. Jennie Corbett has taken a working bond of Alva Mason and M. H. Casson for one year, for \$5000, on Casson and Fraction mines at Pinos Altos.

#### OREGON.

**RICH ASSAYS.**—*Bedrock Democrat*, April 23: The returns from the ore assays from the Chloride mine made by assayer John H. Bacon of this city yesterday, gave the following result: No. 1, 72.18 ounces silver to the ton; No. 2, 192.90 ounces. These returns are very flattering, indeed, to the energetic owners of the Chloride, and show conclusively that the ore becomes richer as development work proceeds, and giving every indication of a mine of which the half has not been told. Mr. Bentley, the superintendent of the Chloride, went to La Grande yesterday to confer with and make a report to the directors and officers of the company.

**FAVORABLY IMPRESSED.**—Several prominent mining men from abroad have recently arrived here and visited the mines of Cracker creek district, and express themselves greatly impressed with what they saw, and will return again in a few weeks to make a more thorough examination. Snow still lies on the ground in that section and somewhat retards locomotion, but within the next week or so, if the warm weather continues, it will rapidly disappear. Then the trails and roads will be open and the mines easy of access, affording one and all an opportunity to visit the mining centers of Baker county.

**PROSPECTING.**—*Jacksonville Times*, April 27: Much prospecting is going on. Most of the miners are cleaning up. Considerable gold dust is now being brought to town. Prickett, Finney & Shearer, and John O'Brien of Steamboat district, are panning steadily and making good progress. Chas. Bailey of Foot's creek was in town and showed us some very rich quartz taken from a ledge he is interested in with Alex. Orme. One small piece was nearly solid with gold and worth \$30. John O'Brien of Applegate a short time since exhibited a 50-dollar slug of gold, taken from the placer mines he is interested in with Thos. Berryman. J. S. March this week showed us some fine specimens of quartz taken from the ledge he recently discovered in Table Rock precinct. They are full of free gold.

#### UTAH.

**SILVER REEF.**—*Cor. Salt Lake Tribune*, April 24: Silver Reef is not dead "but sleepeth." There might be much done here that is not, and if life enough remained to conjecture as to the cause of the condition of things here, much of it would be attributed to the unnecessary idleness of the Stormont Mining Co. This camp can be easily and profitably awakened, and for the benefit of its inhabitants, who are a good average class of people and who have built and improved homes here, I would like to see the company go to work. I am reliably informed that thousands and thousands of tons of 11 to 20-ounce ore is in sight in the Stormont Co.'s property. This property embraces the Stormont, Buckeye, Last Chance, Thompson and McNailey mines and the river mill. A few yards below the Stormont mine (which is the lowest situated of any) is a natural mill-site, down to which ore from all the group could be easily tramwayed, or otherwise conveyed. The ore here is sand-rock, and 5 stamps easily crush 40 tons per 24 hours. The Stormont has a continuous belt of ore that will mine-sample 14 ounces; no ore was shipped to the mill that did not mine-sample 15 ounces. Seldom was anything shipped from the Thompson and McNailey that did not go to 25 ounces, and there are hundreds of tons in stulls and cribs that with little sorting will sample 20 ounces. The Last Chance has an accessible dump of 2000 tons or more that was made when only rich ore was shipped, and it never has been touched since. The rock is easily manipulated, and there is plenty of it. Labor is cheap. Wood is \$8. Stone coal is \$12 per ton. Water is abundant; in fact, many claim that there is enough obtainable to run the machinery of a mill. Ore can be mined and milled here cheaper than in any camp in this country.

**PARK NOTES.**—*Record*, April 28: The Deer Valley Co.'s property is to be further developed by driving the tunnel another 150 feet. The tunnel is now in 500 feet. The Crescent tramway is free from snow, but owing to repairs to the engine being made, it will not start up for about ten days yet. A new boarding-house is to be built at the Daly mine. It will be located north of the hoisting works where there will be much less danger of destruction by snow slides. Sinking in the Crescent's incline shaft was resumed a short time ago, but after going down 12 feet the work had to be stopped because of the water. Pumps will be put in soon, and then this trouble will be an easy matter to control. A gentleman named Smith, of Helena, Montana, who represents the syndicate which bonded the Dolberg group, a couple of months ago, is expected to arrive here in a day or two to open the way for the commencement of active operations on this valuable property.

**ORE AND BULLION SHIPMENTS.**—During the week the Crescent shipped 108,000 pounds of first-class ore. For the week just ended the Mackintosh sampler received 368,520 pounds of Ontario ore and 373,240 of Daly ore; total, 741,760 pounds. The first of the week the Ontario shipped 33 bars of bullion containing 18,724.25 fine ounces of silver. On Tuesday 6 bars of Daly bullion, 6931 fine silver ounces, were shipped from the Marsac mill.

THE

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

**"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.**  
The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:  
N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.  
WE ARE MANUFACTURERS OF THE  
**"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,**  
And will furnish descriptive Catalogues and quote prices upon application.

HOISTING ENGINES  
FOR MINES.  
1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.  
MADE ONLY BY THE  
LIDGERWOOD M'FG COMPANY,  
96 Liberty St., New York.  
PACIFIC COAST AGENTS,  
PARKE, LACY & CO.  
SAN FRANCISCO.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS**, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Pieher vs. R. Hoskin et als.  
We also manufacture the **Single-Jointed Giants**.  
Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.  
**JOSHUA HENDY MACHINE WORKS,**  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our  
**IMPROVED  
HYDRAULIC  
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.  
**HOSKIN & CO., Marysville, Cal.**

FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS, And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.  
OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.  
**FRISBEE-LUCOP MILL COMPANY,**  
GIDEON FRISBEE, Manager, 461 Howard St., San Francisco.  
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

THE SCIENTIFIC KIT OF TOOLS

Warranted the Best and Cheapest on the market. Can furnish Kit complete or any part of it, leaving out articles parties may have or do not want. Can furnish larger Forges with lever if desired. Also the **SCIENTIFIC GRINDING MILL "The BEST MILL on EARTH."**

Farmer's Forge, No. 5 B. Will heat 1 1/2 inch Iron.	Farrier's Pincers, Cast Steel, 12 inch.	Adz Eye Shaping Hammer and Handle, Weight, 9 oz.
Send for Catalogus.	Farrier's Knife, Wootenholm.	Screw Plate, 3 Taps, 3 Set Dies, Cut 3/4, 1/2 and 1/8 inch.
Blacksmith's Combination Anvil and Vice, Hardened Face, Fine Polish, Weight, 50 lbs.	Blacksmith's Hammer and Handle, Weight, 2 lb.	Blacksmith's Drill Press, Hand Feed, Weight, 50 lbs.
	Blacksmith's Tongs, Wrought Iron, 18 inches.	Blacksmith's Cold Chisel, 1 1/2 lbs. Steel, 1 1/2 lbs. Steel, 1 1/2 lbs. Steel.

**THE FOOS MFG. CO., Springfield, Ohio.**

THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as  
**The Safest and Strongest High Explosives in the Market.**  
**GIANT POWDER or DYNAMITE,**  
Of Different Strengths as Required.  
**NOBEL'S EXPLOSIVE GELATINE,** which contains 94 per cent of Nitro-Glycerine, and **GELATINE-DYNAMITE,** Stronger than Dynamite and even Safer in Handling.  
**JUDSON POWDER IMPROVED.**  
**FOR RAILROADS AND LAND CLEARING.** Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroad and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.  
**BANDMANN, NIELSEN & CO.,**  
CAPS and FUSE for Sale. GENERAL AGENTS, SAN FRANCISCO CAL.

SOLE AGENT FOR

Adamantine Shoes, Dies and CRUSHER PLATES, AND Chrome Cast Steel for Rock Drills, Etc.

ADAMANTINE.

H. D. MORRIS,  
220 Fremont St., San Francisco,  
MANUFACTURERS' and PURCHASING AGENT.

Special attention given to purchase of  
**MINE and MILL SUPPLIES.**

ADAMANTINE SHOES AND DIES.—Guaranteed to prove better and cheaper than any others. Orders solicited, subject to above conditions.  
H. D. MORRIS.

LIGHTNING WELL MACHINE MAKERS.

We are the largest Manufacturers—have sunk 329 ft. in 10 hours. Our Encyclopedia of 500 engravings of Well, Wind-Mill, Prospecting, Pumping and Diamond Pointed Rock Drilling Machinery, or our treatise on Natural Gas will be mailed for 25 cts. Are using parties who advertise to make Hydraulic machinery, and their customers for using.

## JAMES LEFFEL'S

### Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 220 Market St., San Francisco Elevator, 12 Front St.

## THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

## ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?

Are you going to make any change in machinery? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of

THE DODGE PATENT INDEPENDENCE

## WOOD SEPARABLE OR SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and

Most Convenient Pulleys Made in the World. Entirely new and original. Adapted to any power required. Time, trouble and money saved by using these pulleys.

For Price List and Catalogues mailed free.

## THE RUSSELL PROCESS COMP'Y.

C. A. STETEFELDT, President.

NEW YORK OFFICE, 18 BROADWAY Room 709.

## Petroleum Fuel.

As several times mentioned in the PRESS, there has been a contest going on between the oil men and the insurance fraternity on the subject of the proper use of petroleum as fuel. For several months the supervisors have had the matter before them, and both sides of the controversy have been heard before the Fire Department Committee. The main point has been that the oil men wanted a fire test of 80 degrees, while the insurance men insisted on a test of 90 degrees. Meantime permits have been granted in several cases. The Fire Commissioners petitioned the Board to regulate the use of petroleum, and especially to amend the resolutions being considered by increasing the test to 90 degrees, and permitting fire wardens and their employees to inspect the fuel at its place of storage.

This week the matter was finally settled in the board when the resolution granting the Glass Works, Candle Company and Wire Works permission to store for use as fuel over two weeks ago, came up on final passage.

Supervisor Boyd then introduced amendments as follows:

First—Striking out the 80 degrees, and inserting 90 degrees.

Second—Inserting "And in case of a refusal on the part of said \* \* \* or their officers or employees to allow any member or members of the Board of Fire Wardens to visit and inspect said premises and the petroleum oil being used at any time while the said works are in operation, then this privilege shall cease and determine and become null and void."

Supervisor McDonald said he was just as much disposed to protect life and property as anybody. But an increase to 90 degrees would make the use of petroleum impossible. In explaining his vote later, on the passage of the resolutions as amended, to print, McDonald said: "This increase to 90 degrees will so increase the cost of the oil as to render its use as fuel impossible. I have no special interests to subserve. I only want to balance the manufacturing and other interests of the city. The glass, works, for instance, will not be able to compete with Eastern manufacturers unless permitted to use crude petroleum of 80 degrees test. The works are isolated, and no steam or engine is used in them." McDonald voted against the proposed amendments.

Mr. Knorr also voted "no," and in explaining his vote said: "We have had this matter under consideration for eight or nine months. We have heard the testimony of experts, and have learned that the distillation necessary to increase the test to 90 degrees would make the fuel cost more than coal, even at present rates. The Julia matter ought not to be brought in at all. The petitioners have not asked leave to inject petroleum under boilers at an intense heat. We shall simply prohibit petroleum fuel if we fix the test at 90 degrees; and to give the fire wardens or any employees of the fire department the power to bring to an instant standstill the operations of a large manufactory would be to place too much power in their hands."

The amendments were adopted by a vote of eight to two, so that the 90-degree fire test will now be the rule, and the insurance and coal men win their contest with the manufacturers and oil producers.

The result may be regarded as a setback to the manufacturing interests of this city. Coal is always high in price, and just now it is abnormally so. The oil fuel is economical and handy, and were it not for the restrictions more manufacturers would use it than now do so. Moreover it is a natural product of the State which should be utilized as far as possible. The expense of preparing the fuel to stand the 90-degree test increases the cost materially. In this connection it may be stated that since oil has been used by one of the establishments mentioned above, there have been two fires caused by spontaneous combustion in the coal piles in its yards. The manufacturers insist that there is no danger in the use of the oil and are willing to agree to reasonable restrictions, but they object to those that have been adopted.

ATTORNEY-GENERAL JOHNSON, in an opinion relative to which one of the two Boards of Fish Commissioners was entitled to hold office, has decided in favor of the old board, Joseph Rousier and J. Downey Harvey; also, Charles Josselyn, who was appointed by Gov. Waterman, vice Sherwood, resigned.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BOTTLE-WASHING MACHINE.—Henry Palmer, S. F. No. 381,638. Dated April 24, 1888. This invention relates to that class of bottle-washing machines in which the bottles are supported and carried in a drum or frame mounted and adapted to rotate in a vessel containing water. The invention consists in an improved drum or frame whereby the bottles are supported in a horizontal position parallel with the axis of the frame, and by which their exterior surfaces are scraped clean. The object is to form a rapidly operating automatic machine for washing bottles.

ORE-ROASTING FURNACE.—James L. Lovell, Austin, Nev. No. 381,629. Dated April 24, 1888. This consists of a cylindrical, horizontal or vertical rotary furnace body, and in combination therewith of two or more fireplaces, with hanging walls in the receiving chamber. By the peculiar construction adopted, the inventor has been enabled to raise the amount roasted by the furnace from 65 per cent, which was done before these improvements were added, to 97 per cent, that the furnaces have done since Mr. Lovell's improvements were added.

PROTECTING PILES.—George Brown, S. F. No. 381,671. Dated April 24, 1888. This invention relates to an improved means for protecting piles from the ravages of marine, worms and insects. It consists of an exterior casing made of strips of wood or material which will resist the attacks of worms or insects. This casing is jointed so as to make it watertight, and is supported at a short distance away from the body of the pile by blocks fixed around the pile at intervals, and the ends are finished out by solid beveled blocks which close them completely. The space within this exterior casing is filled with an adhesive or binding compound. In connection with this is employed an extension or fender upon such piles as are exposed to contact from vessels or exterior abrading substances.

TROUSERS OR OVERALLS.—John Hetherington, Haywards. No. 381,624. Dated April 24, 1888. This invention relates to that class of garments which may be distinguished by the qualifying term "pantaloons," and includes what are ordinarily known as pants or trousers, overalls, etc., and this invention consists in an improved pantaloons garment. The pocket is made in a peculiar manner, which affords economy in time and lends strength to it by not having the seam at the bottom, so that any rip takes place in the side where it is not usual for a rip to occur, and the formation of a double pocket affords convenience to the wearer.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Cons. California and Virginia, April 23, \$88,276; Savage, 23, \$32,000; Hale and Norcross, 28, \$103,000; Confidence, May 1, \$13,681; total so far for April, \$164,970; Standard, 1, \$4624; Germania, April 26, \$3721; Hanauer, 26, \$1620; Queen of the Hills, 27, \$1300; Hanauer, 27, \$1600; Germania, 28, \$1800; Bluebird, 28, \$32,736; Lexington, 28, \$24,024; Moulton, 28, \$14,992; Germania, 29, \$1661; Hanauer, 29, \$3150; Queen of the Hills, 29, \$1250; Crescent, 29, \$2150; Germania, 30, \$3605. The shipments cut from Salt Lake City for the week ending Saturday, April 28th, were 18 cars of bullion, 439,602 lbs.; 64 cars of silver and lead ore, 1,642,680 lbs.; 4 cars copper ore, 106,700 lbs.; 1 car copper matte, 26,600 lbs.; total, 87 cars, 2,215,672 lbs.

## Mining Share Market.

The stock market has been comparatively active for the past few days. The feature of the week has been the declaring of a dividend on Hale and Norcross of 50 cents per share. This is the first dividend declared on this mine since the 10th of April, 1871, which was of \$5 per share on the 8000 shares then in the mine. Up to the present time there has been \$1,598,000 disbursed in dividends, and \$5,086,000 collected in assessments, the last of which was on July 7, 1887. The company has on hand in excess of mine expenses, which are nearly all paid up, a surplus of \$107,097.77, of which \$88,097.72 is in gold coin at the bank, and the balance, \$19,000, in refined silver bars at the Carson mint, with further shipments to arrive ere the close of the fiscal month. The dividend is payable on Tuesday, May 8th.

The Virginia Enterprise says that work on the Sutro tunnel drift to connect with the 1300 level joint Crown Point and Belcher drift will not commence before May 1st. Ingersoll drills and other implements to rush drift work are being taken out of the joint drift and transferred to the Sutro tunnel side, where preparations are making to work them effectively. The Sutro tunnel has 900 feet to run to make the connection. When this is made the south end mines can be much more advantageously worked at that depth. They are much retarded now for air on the deeper levels which they are working. The upraise on the 1300 level of the Belcher is intended to develop a large section of absolutely virgin ground. Not a pick has ever been struck in this ground below the 300 level of the Belcher on the south end. The upraise is now reported to be looking well. Should a promising ore body be struck at that point it will have its full speculative value unhampered by former prospects and old timbers.

## New York Metal Market.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

**JUPITER GRAVEL, MINING AND WATER CO.**—April 30. Object, to do a mining business and also to furnish water for all purposes to the towns of Murphys Camp, Douglas Flat, Vallecito, Carson Hill, Angels Camp and Altaville, in Calaveras county, and to Jack Rabbit, Monarch and Jupiter mines in the same county. Capital stock, \$10,000,000. Directors—W. A. Keefe, J. D. Whitney, John A. Hammersmith, Frank J. Allison, Eugene N. Deuprey, W. S. Wood and E. A. Grow.

**SAN FRANCISCO NATURAL GAS AND OIL CO.**—April 30. Object, to bore for gas and oil. Capital stock, \$1,000,000. Directors—John W. Stewart, J. W. Brown, A. H. Hogg, C. G. Nagle and A. E. Bald.

**MUTUAL ENTERPRISE CO.**—April 30. Object, to do a general mining, milling and ore-reduction business. Capital stock, \$15,000. Directors—O. H. Bogart, J. M. Bryan, D. E. Barger, B. C. Brown and W. A. Searles.

**NORTHERN CALIFORNIA LAND AND LUMBER CO.**—April 30. Object, operating sawmills, mines, colonizing lands, etc. Capital stock, \$1,000,000. Directors—Geo. McCarthy, Geo. H. Forster, Frank Dalton, Geo. McCord, David Bush, Geo. M. Mitchell and T. L. Potter.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

HUGH O'HARA has struck a 25-barrel oil well in Santa Paula canyon, not far from the town of the same name.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

Dewey & Co.'s Scientific Press  
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Practical Treatise on Hydraulic Mining.  
By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurly, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & CO., Publishers, 252 Market St., San Francisco.

## THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Sole Manufacturers,

227 First Street, San Francisco, Cal.

THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Bore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

The Greatest Rock and Ore Crusher on Earth

— IS —

## THE GATES!

It Crushes Finer and with Less Power and Wear than any other Machine made.

SIZES OF VARIOUS CAPACITIES RANGING FROM ONE TO ONE HUNDRED TONS PER HOUR.

SEND FOR CIRCULARS.

**PACIFIC IRON WORKS, San Francisco, Cal.**

Agents for the Pacific Coast.

### THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

### AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**

## Glendale, Montana.

## Old and New Prospects.

EDITORS PRESS:—Three furnaces are running at the Hecla smelter here at present. One has been shut down a few days for repairs, but is now in operation again.

We understand that this company's mines produced more bullion during '87 than any previous year. Much of the money has been expended for improvements, principally in timbering and developing the mines. So much for good management.

Mr. Kemper (millwright) has a crew of men repairing the company's concentrator at Greenwood, which is to be started up in a few days. The tramway between there and the mines is now running.

We understand the works are to be operated more steadily and extensively this season than ever before; hence the outlook for Trapper gulch is very favorable.

J. O'Green has disposed of an interest in his mines on Cherry creek, about five miles south-east of Lion hill, to some Butte parties. We hope to learn of valuable developments before the summer is over. That locality has been very little prospected yet. We are looking hopefully toward the development of

## Vipond District.

Located about ten miles from here, north-west-erly, and about six miles northerly from the famous Hecla mines in Lion hill.

This is apparently one of the most promising undeveloped districts in Western Montana, but like many more prospects, in the wrong hands. The Mowonotoc and Gray Jockey mines owned by Brown and Vipond brothers are apparently the best prospects in the district and have been developed sufficient to show vast bodies of ore.

The Gray Jockey is from 15 to 37 feet in width. The ore is mostly milling, and a great portion of it runs from 40 to 60 ounces of silver per ton; some runs over 100 ounces.

The Mowonotoc is not so extensive, being from four to six feet in width except at one place where the ore body is 20 feet wide; but the ore is very rich, running from 150 to 500 ounces in silver, and carrying considerable lead. About \$25,000 worth of ore was shipped from these two mines years ago, when it was freighted to the U. P. R. R. by mule teams; but now the property is idle.

The discoverers, Vipond brothers, rambling, restless prospectors, whose home is in Africa, Australia, Mexico or anywhere else that a mining excitement is raised, seem to have left the management of the property to their co-owner J. A. Brown, one of Montana's cattle kings, who, like the majority of ranchers, nature seemed never to have adapted to the development of mines.

Less than a mile westerly from the property last referred to is the Faithful, owned by Armstrong & Losse and Fansher. From its several carloads of ore have been shipped with good returns. The ledge is from 10 to 25 feet in width, mostly milling ore, but carrying some lead. With the right kind of reduction works on or near this mine it might be considered a bonanza; but the principal owners are too deeply interested on Puget Sound and other distant places to do more than represent this property.

In the same group we should mention two more prospects—the Cordwood and Rich-hill, owned by Joseph Storm—both of which look well so far as developed, and from which the owner has sold considerable ore.

It is too bad that a district so favorably located for timber, water, and roads, should have lain idle so long, yet it seems the fate of many of the best mining localities to exist under a ban for a certain length of time before they get their boom. However, we understand Mr. Brown is awaiting the return of his co-owners—who are now in Lower California—when "something will be done."

Across Sheep mountain, about two miles (air line) westerly from the mines above mentioned, is another group very little developed. The most promising of these is the Bluehill, owned by Thomas and Shepherd, from which several carloads of argentiferous galena have been shipped to Omaha with good returns; but water forced the owners to suspend work, until some means of pumping or draining have been applied.

Higher up the mountain-side southeast is the Lily, owned by George Chin, who aims to work it during the coming summer. Former owners shipped a quantity of high grade ore to Omaha, which inspires George with hopes.

Near the summit of the mountain on the east side is the Grand View, owned by Terry Bros., who have labored faithfully, but with some mishaps by caving in of shafts.

In addition to the above many smaller prospects have been discovered, and we expect before the summer has passed some fine bonanzas will be developed in this district. B.

Glendale, Montana.

## Cryolite Mining.

I talked with two old-time sea captains the other day. One of these hardy navigators was a tall, full-faced, well-built, hanevelot looking man, Captain Louchlan McKay. In command of the Sovereign of the Seas, one of the famous old clippers that once made Americans proud of their merchant marines, Captain McKay left New York for San Francisco in August, 1851; the freight money amounted to \$85,000, a very large sum to-day; a barrel of flour in San Francisco in those days of gold fever sold for about \$45. Off Valparaiso, in a storm, Captain McKay's ship was dismasted but rigged up again, and reached her destination in 102 days, which was a quick passage. Discharging her cargo, the gallant clipper sailed for Honolulu and loaded with oil for New York, and made the extraordinary time of 82 days.

For 10,000 miles she sailed without tacking or wearing, and in 10 consecutive days she made 3300 miles. But the days of the noble old clippers are gone, and I went to see this veteran of the sea about the ships that trade with Greenland. His are the only vessels that go regularly to the far-off land of Kaue. They go out in ballast, for although Greenland imports wheat, brandy, coffee, sugar, tobacco and fire wood, it is not from this country. They bring back a metal termed cryolite, which they obtain at a port called Ivigtut, on the southwest coast of Greenland. It is a bleak country, even in the short summer, during two months of which, June and July, the sun is always above the horizon. Mosses, stunted shrubs, dwarfish trees and huckleberry bushes are about the only vegetation, and the bare mountains in the grip of the great glaciers and the generally dead and desolate aspect of the country make it appear as strange and unreal as that gray corpse of a world, the moon.

Cryolite looks like ice, and hence the name signifies ice-stone. It is all taken to Philadelphia, and is used in manufacturing soda, alum, lye, porcelain piano keys, door knobs, clock dials and other articles. The seven harks in the trade each carry about 800 tons of this strange mineral and make 14 voyages in a year. Last year they brought \$400 tons to this country. Those at Ivigtut are the only known mines in the world. Specimens of this mineral has been found in the Ural mountains and on Pike's peak, but no other actual mines but those in Greenland are known. It takes 20 days to go to Ivigtut and 30 to return. The Danish Government owns the mines, and they are worked by a company that pays a royalty to that government.

The vessels in this trade are built unusually strong in order to withstand the rigors of that frozen region; they have steel plates on the bow, iron on the stem or forward part of the vessel, double planks on the sides, and are filled in with timbers, and yet three years ago one of the stannoh barks was lost in the ice, and one that reached the open sea was never afterward heard from. The danger is not so much from icebergs as from the great blocks of floating ice or "flow ice." For eight months of the year, or in the winter season, it is a continuous night, and navigation is especially dangerous. During the four summer months of the year vegetation makes rapid progress, but it is of a dwarfish character, and the tallest trees do not exceed 18 feet. The greatest recorded cold of Greenland is 68° below zero, and the greatest heat 53° above, while the average for this year is 3° above zero.

The little port whence the supply of cryolite is obtained has a population of about 150 miners and as many Esquimaux. It is not a place that invites civilization, and the natives, debauched by the whisky of the Caucasians till the sale of that beverage has been interdicted, probably think they do not lose much by living in what the civilized usually regard as a lost land, captive in the grasp of the Arctic terrors that guard the awful approaches to that mysterious and fatal objective point of human ambition and daring, the North Pole.—O. W. Riggs, in Philadelphia Press.

## Concentrating Dakota Tin.

From the Rapid City Journal we take the following account of the recent concentration test of tin ore made at the school of mines:

The question of concentration as applied to tin has finally been officially settled at the school of mines. Dean Carpenter long ago expressed himself as confident that the tin rock could be easily handled by the jiggling process, and that that was the true method of concentrating it. The belt concentrators had proved partially successful only. Some time ago, 1800 pounds of tin rock was furnished the school of mines by Sam Scott, from his Sunday Gulch property. After many delays, more or less vexatious, this was finally run through on yesterday. It was broken and crushed in a jaw-crusher and a Cornish roll, and then put through the jigs. The tailings were carefully panned by many experts, and not a trace of cassiterite found. The jigs had saved all the tin in the rock. The process is a remarkably simple one, and the success of this experiment surpassed Dean Carpenter's most sanguine expectations. He did not think the jig would save all the metal, but it does.

The cost of crushing and concentrating by this process was stated once as being 50 cents

per ton. This is based on actual experience. At the Fresland mill near Idaho Springs, Colorado, galena and iron pyrite ore is crushed and concentrated by this process for an average of 37 cents per ton. The cost of the plant is much less than a concentrating plant similar to that used at the Etta. The trommels, jigs and huddles are not nearly so complicated and costly as their names would suggest, and the rock-breaker and Cornish rolls are the most simple appliances. The plant at the school of mines is large enough to handle about 10 tons of rock per day. A concentrating works can be put in at the mines at a most reasonable figure, and work can be done from the first on the certainty of success. The question of how to concentrate the tin rock of the Black Hills is no longer open.

## Ice and Brimstone.

Sulphur and sheol are usually synonymous in one's thoughts, and when we hear of a mine producing native sulphur, we intuitively think that it must be near the hot regions. Recently this element was found in the Queen of the West mine, over in the Horseshoe, under the brow of Gray's and Irwin's peaks. Like all other mines in that region, the Queen is a great producer of the mineral popularly known as ice, which extends from grass roots to a depth of over 300 feet. The entire vein is frozen, and vugs are found filled with masses of black ice, the color probably being derived from manganese, which occurs in noteworthy abundance.

Altogether the mine is a very peculiar one not only from being frozen, but because of the diversity of minerals found. Probably the largest masses of silver glance found in the State have been from this mine, and another remarkable circumstance is that nearly all the large pieces of glance were found in nodules of ice that fill vugs. Sometimes the glance assumes a very peculiar form of crystallization, consisting of elongated four-sided prisms, an inch or more in length, and a half-dozen or more of them grouped together, yet each independent and separated from the other, the ends usually terminating in massive silver glance. The more common minerals of our mines occur in greater or less quantity, and besides the native sulphur already mentioned, four forms of manganese are found. Alahandite, the sulphide of manganese, occurs in large quantities, and cubic crystals of the mineral are occasionally met with. Pink rhodochrosite, the carbonate of manganese, is found in rhombic crystals and small masses. The crystals are frequently dotted with small gray nodules, which react for manganese. Pyrolusite, oxide of manganese, is found in small quantities of a purplish color. Specimens brought over a few days ago consist of an intimate mixture of sulphur and the manganese minerals, together with about one-half per cent of silver.—Georgetown (Colo.) Courier.

GOLD AND SILVER OF COLORADO.—The precious and superior metal production of the State of Colorado to date amounts to something over \$300,000,000, or an amount equal to the earnings of 1200 men for 25 years, allowing \$1000 per year for each man. As extensive mining in this State does not date back as far as 25 years, and if it is an indisputable fact that the average number of miners employed does not aggregate 12,000 men, it must be apparent that a great profit has been made by those who advanced the money necessary to conduct the mining operations of this State. This assertion is further demonstrated by the vast amount of money disbursed by Colorado mines in dividends during the last decade. The total amount of dividends and profits paid by the mines of this State during the last decade will fall little short of \$50,000,000. This does not include the earnings from coal, iron and other mines. The production of the State may properly be divided up as follows: Gold, \$83,000,000; silver, \$180,000,000; lead, \$32,000,000; and copper, \$5,750,000, making a total of \$300,750,000. The accuracy of these figures is quite satisfactorily substantiated by various United States mint and geological reports and statistics compiled by the last census bureau. These aggregates show most creditably for a new country like Colorado, which only a score of years ago was regarded as comparatively valueless, and was separated from the outside world by nearly 700 miles of intervening and arid plains.—Denver Tribune-Republican.

CHARCOAL MAKING for the San Francisco market is about to be commenced on a large scale in Mendocino county as a result of the extension of the San Francisco & North Pacific railroad from Cloverdale to Ukiah. As but few of the owners of timber land in that section understand the manufacture of charcoal, contractors from this city are making arrangements to pay a certain price per sack to those who wish to clear land for the privilege of allowing the purchaser to place men on the land to cut off the timber and make the coal. By this arrangement the land-owners expect to have their ground cleared with profit and done quickly.

It is the intention soon to build a telegraph line from this city to Point Reyes, under the direction of the Signal Service office. It will be about 40 miles long, and construction and full equipment will cost \$5000.

## The Disease of the Emperor.

[Translated for the PRESS from *Le Siecle* by M. N. M.]

"What disease has the Crown Prince (Emperor)?" That is difficult enough to say even now. It is certain that the physicians are not in accord. One may justly conclude that his case is quite exceptional. It seems that a great deal was expected of the microscopic examination by M. Virchow, from the fragment of mortified tissue ejected by the patient, and which had been sent in alcohol from San Remo to Berlin. The report of M. Virchow seems to have been made with a view to a wide publicity. A report merely technical, and written for physicians only, would have, probably, been expressed in different terms. The impression which it gives is that the celebrated anatomist finds himself powerless to direct the physicians. Is it an attack of cancer of the larynx, or of tumor, or of tubercles developed in the larynx; or has there been in the larynx only a series of conditions like those which came what are called "clouds" (hoils)?

M. Virchow, in His Report.

Points out a certain analogy of appearance between the fragment which he received and the mortified part called "bourbillon" (core), which forms in a boil, and of which the discharge marks generally the cessation of suffering.

The greater part of the tissues of our body are in some way transfiles of special fibres, extremely delicate; yellow when they are in mass, elastic, and, above all, unalterable. They resist putrefaction, and even digestion in the stomach of an animal. The history of these fibres we may say was made known three quarters of a century ago by M. Chevreul. In the bourbillon which comes from a boil, these elastic fibres are distinctly recognizable; they have remained intact in the midst of all the other tissues which have rotted. M. Virchow has found them even in the fragment expectorated by the Emperor. It should not be forgotten that the parts thus thrown off by a patient are always dead, and often have been dead for a long time. They have lost their structure, their constitution. It is necessary, therefore, that the yellow elastic fibres may have the indestructibility which characterizes them in order to be still recognizable. It is not upon the mortified fragment examined by M. Virchow that he would have been able

To Find Again the "Cellules Cancereuses"

Of which there is also question in his report, and which he declares do not there exist. If they have been seen, it could have been only on the little fragments of the paroi (inner-side) of the larynx, and which have been carried off without doubt, intentionally, by the physicians, with the object of examining for such cancerous cells. This name of "cellules cancéreuses" sent forth to the public, requires some explanation. In order to better comprehend what we have to say, it is necessary to go back to the ancient belief upon tumors. The physicians in old times thought that a tumor was a sort of foreign parasite in our bodies, not a microbe, but a gross animal, a sort of internal vampire, which gnaws us. Now, there are certain tumors which seem envolved under the skin by radiant expansions. It needed only, then, that one should see in them some claws to arrive at the conclusion that

## The Devouring Animal was a Crab

—in Latin, "cancer"—from which has come the name of that terrible affection. In more than one old author of surgery of the sixteenth century we find engravings representing patients who carry in some part of their bodies this crab which gnaws them.

That others besides harbar surgeons may have veritably believed in the existence of this crab in the flesh, is very probable. Then, when an ulceration was forming it was the cancer, the crab, which had eaten the skin in order to nourish itself. Hence the strange treatment of the ulcerated cancers, which consisted in applying, at the shop of the butcher, a slice of fresh meat. It was intended to divert the voracity of the beast, in order that it might leave the patient tranquil.

However, science was moving on. At the beginning of the century it was discovered that a great number of tissues, such as those of the glands and of the epidermis, are made up of little juxtaposed bodies intimately united to each other, but each having in a certain measure its own life. They were called "cellules."

## The Length of Life of the Cells

Is not necessarily that of the bodies. Thus, in the glands, upon the skin, they live a very much shorter time than we do. They develop, mature and die, some in a few days, others in a few weeks. During this time they so multiply that finally the same number always remains, and the epidermis, or the gland, in undergoing this renewal, changes neither in form nor volume. When we examine under the microscope a particle of tumor or cancerous ulcer, we find still some cells, but very different from all the normal cells, and presenting nearly everywhere the same appearance. They are very large, with expansions and prolongations; they have the most fantastical forms, and reproduce themselves much quicker than the ordinary cells. Then, by a singular turn, we come back to the idea of a parasite. It was supposed that these cells were of a particular species, foreign in some manner to our nature. Without expounding upon their origin it was admitted that

they were intruders and that they were coming definitively to develop themselves in our bodies at the expense of its natural elements. The rest naturally explains itself. In order to live, these cells absorb the principles of the blood essential to the surrounding tissues, which, consequently, were left to be invaded until followed by death.

#### Such is the Origin

Of that expression "cellule cancéreuse," which for a long time designated something distinct from the organism, as the microbes are now. When that particular cell took birth (it is not said how) and developed itself at the lips, in the stomach, or in the larynx, the physicians declared that one had cancer of the lips, of the stomach or of the larynx. That doctrine, called the *specificité* of the cellule cancéreuse was introduced in France by Herbert de Zurich. He had been, at Paris, the friend and co-worker of the lamented Robin. The latter, however, much more learned, soon, by force of patient observation, completely upset the doctrine of "specificité." Robin demonstrated that the cellule cancéreuse was not at all a special cell as was believed. He collected a considerable number of facts, from which it clearly resulted that the cells of all the glands, or of all parts of the epidermis, were able in an indistinct manner, under unknown influences, to take on the character of the cancerous cells, to become more gross, to assume a bizarre configuration, a more active vitality, and, consequently, to invade the surrounding tissues even to the exhaustion and death of the patient.

It seems even from the text of the consultation written out by M. Virchow that the doctrine of Robin have now conquered the medical world after having been long combated, even in France, by the disciples of the celebrated German anatomist. It is true that this more scientific explanation of the affection called cancerous have made no fundamental changes, but it at least encourages the hope that perhaps some day there will be found the means to arrest by simple remedies, administered internally, the exuberance of life which takes certain cells of our body, and turns them to its destruction.

#### Field for Prospecting.

We feel that too much attention cannot be called to this county as an excellent field for prospectors, says the Nevada county *Transcript*. Almost all mining experts who have come here during the past year declare we have the richest mining county in the State, and our people are convinced of it. Since the pleasant weather began a large amount of prospecting is carried on. This is the most favorable season of the year for prospecting either for quartz or gravel, and all who are idle would do well to get out on the hills and try and strike something that would pay. There is an immense amount of ground in the various districts of the county yet unprospected, and one man has as good a chance of making a "ten strike" as another. In the older mining districts of the county there are undoubtedly rich spots and unopened claims which need enterprise and industry, backed with capital to open them. Every dollar and every hour's work spent in the development of the mineral resources of the county will result in the ultimate benefit of the county and the parties engaged in it. Some claim there is no certainty of making a strike, but in this respect our avocations are not much better than mining. Every business enterprise, and not a single exception can be named, is but an experiment, in which men venture money, in the hope, without a certainty, of getting it back. The farmer who sows his grains, and the merchant who buys a stock of goods, make ventures which may result in success or failure. Crops fail and stocks of goods become valueless, and in almost all kinds of business there is an uncertainty. The prospector who finds his gravel pans out well, or who strikes a ledge, giving evidence of richness, takes no more chances in making it than men often do in other kinds of business. Every kind of industry requires earnest labor, constant attention and a knowledge of work to carry it on. With these requisites in view, give the miner a pick and shovel and turn him loose in this county, and he will certainly make a living, and he more likely to get a fortune than in any other business.

**AN IMMENSE METALLURGICAL PLANT.**—A number of Spanish capitalists have united for the purpose of erecting a large metallurgical and shipbuilding establishment in the Basque provinces, at an estimated cost of about \$15,000,000. The Spanish iron-founders and shipbuilders have made great efforts to participate in the increased orders recently given by the Spanish naval and military departments, and a feeling has been expressed that where it was found absolutely necessary to confide orders to foreign houses the orders in question ought at least to be executed on Spanish soil.

THE amount of coal taken from the coal mines in the Mount Diablo range, in the county of Contra Costa, from 1861 to 1885, as shown on the books of the various companies, makes a grand total of 2,667,580 tons. Of this amount, 1,402,215 tons was taken from the Black Diamond mine, in Nortonville. The average is over 109,000 tons per year for the 25 years referred to.

#### The Fraser Wine Process.

When it was first announced that by the process for maturing wines and liquors discovered by Dr. E. J. Fraser of this city, every gallon of wine and brandy produced in this State could be fully ripened and fitted for sale and use each year, before the next vintage was placed on the market, the idea was at once scouted and pronounced impossible. The claims put forth were so revolutionary, and so contrary to all past experience, that people could not be brought to believe it. Even when the fact was brought directly to their personal knowledge by the treatment of their own wines, and the results seen and determined by taste and the opinion of experts, it appeared too much—too good a thing for some to believe, and many have continued doubting until after the fullest investigation by the most competent and highest authorities in the State has pronounced the claims for the process fully sustained.

#### What the Process Accomplishes.

Sweet wine and brandy taken immediately from the vintage after being subjected to the process for from four to six weeks, is ready for the market and use, as thoroughly aged as that treated in the usual way for two or three years. Dry wines require but three or four weeks of treatment, when, after being cleared of sediments by simple and well-known processes, they are fitted for use.

This result leads to the following economical facts:

The cost is a mere trifle, within the reach of all. It saves the usual large loss by evaporation. It saves the interest not only on the cost of the wine, but also on cooerage and cellars in which to store it. It saves much labor and insurance.

But perhaps the most important advantage gained is the possibility that small wine-growers and manufacturers will be able to hold and handle their own wines until they can be placed upon the market for immediate use, without paying large commissions to middlemen, or selling their wines directly at a ridiculously low price. The opportunity which this process gives the vineyardist and the small wine-maker enables him to handle even large amounts of wine with a very small capital and put into his own pocket all that there is in the business.

All these facts have been substantiated by the most crucial investigation and proofs.

The first ordeal was in the United States Patent Office. Here it was placed under the most severe tests of expert taste, the microscope, and chemical reagents by Prof. Clifford Richardson, of the Agricultural Department at Washington, assisted by Prof. H. A. Hueton, Assistant State Chemist of Indiana.

Prof. Richardson, in his report to the Commissioner of Patents, said:

"In each case I have been able to distinguish a decided difference in favor of the samples marked 'treated,' and that the invention is 'worthy of consideration.'"

The process has been patented in the United States and all the leading wine countries of Europe. It is covered by two patents.

The process has been thoroughly investigated by numerous experts and scientific men both in this State and at the East. Prof. Chas. P. Williams, Professor of Chemistry in the Missouri School of Mines, after thorough investigation, reported: "The changes produced in wines and liquors in the magnetic fields are not distinguishable from those effected by time."

Prof. E. W. Hilgard subjected the process to a most thorough and prolonged test in his laboratory at the State University, and made a most favorable report, which has been widely published.

During the professor's investigations he received for treatment a package of his best three-year-old wine from Jacob Schram of St. Helena. The wine was duly treated, returned to Mr. Schram, who subjected it to the test of wine experts besides himself, all of whom testified to the fact that the wine so treated "had been improved in every quality going to form a matured wine, such as softness, flavor and fullness, as also of age in contrast with samples of the untreated wine."

This statement goes to prove that even old wine can be greatly improved by the Fraser process. Mr. Schram says in reference to this experiment that "it went in three years old and came out 4½ to 5 years old," and yet the time of treatment did not exceed four weeks.

#### The State Board of Viticultural Commissioners

Was the last public institution to which the process has been submitted. This is a body in whom all the State has the fullest confidence in all things relating to viticulture. Sixteen samples of wine—port, claret and sherry—were submitted to the test. The following well-known wine experts went through them: Messrs. R. J. Harrison, Dr. J. A. Stewart, H. A. Pellett, E. C. Prieher, J. Pohndorff, H. W. McIntyre, N. E. Rose and I. De Turk. In every single instance the treated samples were given the preference over the untreated, and in many cases the expressions were very pronounced in favor of the treated. The test was a very trying one. Some of the wines tested were matured ones, all of which were pronounced "improved" by the process. There was no possible clew by which the committee were able to determine the treated and untreated samples except by taste, and yet there

was a pronounced difference noted in every instance.

#### These Facts Have a Scientific as Well as Economical Interest.

This new discovery is evidently that of the application of a natural law, applied in a more active manner than is possible by unaided nature. It produces natural results which, when left to the natural processes of time, are necessarily slow, tedious and expensive. Like all other discoveries, it at first met with doubts, old incredulity and opposition. But truth is mighty and always prevails. This truth has withstood the most crucial investigation, and has passed through it successfully. It is confidently believed by those who have examined most thoroughly into its merits that it will prove one of the most economical advantages to California that our people have ever met with. It will raise the viticultural interest from its present depressed condition to one of the most prosperous in the State.

#### To Be Introduced in Germany.

We understand that a wealthy German viticulturist came to California a short time ago and visited Dr. Fraser with the sole view of gaining a more thorough knowledge of the matter than he had been able to do by correspondence. The result of his visit was the purchase of the right for Germany, where he will proceed at once to introduce the process, which he considers one of the first importance and one calculated to work a revolution in the wine-making interest throughout the world.

Arrangements have been made to put up a plant in this city to be composed of 500-gallon tanks which will be in operation within 60 days.

#### Great Guns and Torpedoes.

There seems to be a difference of opinion in regard to the relative value for destructive purposes of great guns and torpedo boats. In a paper on modern weapons in naval warfare recently read before the British Institution of Naval Architects, Captain Huhert Greuffell, of the British navy, expressed a preference for guns over torpedoes as weapons, and expressed much doubt as to the value of torpedoes in naval warfare. Among other things he remarked: "In destructive effect I see the gun equal, if not superior, to the torpedo, and in many other important respects—in area of effect, in accuracy, reliability, strength and simplicity of construction—far beyond it; and I make bold to say that in my opinion it maintains these advantages throughout the whole scale of its application from top to bottom. That being so, I view with some surprise the tendency to supplant in some vessels the more powerful by the less powerful weapon, and I do not think this change will stand the test of experience and use."

Pertinent to the above we clip the following from a late issue of the *Philadelphia Ledger*: "In regard to the defective great guns that are being turned out by the British Ordnance Department comes the cable dispatch from London telling the American public that, in a naval sham fight off the mouth of the Thames on the same day, one gun hurst on the torpedo boat *Culew*, which seriously injured several sailors, and another hurst on the armor-plated ship *Black Prince* and hurt three seamen. All this makes curious sequence concerning British great guns: First, there are not enough of them to equip the vessels that need the guns, without dismantling fortresses to supply them; second, they seldom have enough of the special ammunition (special shells) they require to put them safely into actual battle or bombardment; and third, when there is ammunition enough the guns get hurst in short order. These facts come in the current news, and they would be grotesque if they were not real and on a subject of practical importance, which happens just now to have an immediate and serious interest for the American public, which is impatient to have great guns as the British have."

**THE BIG STEEL WORKS.**—At last it is definitely reported that a contract has been finally entered into between the Moss Bay Iron and Steel Co. of North Cumberland, England, and the N. P. R. R. Co. Under the terms of the contract the English company at an early date began the erection of very extensive works at some point in Kittitas county, probably at Cleelum, and the Northern Pacific is to extend the Cleelum-Roslyn coal branch railroad to the great Upper Cleelum iron and coal mines. Eighteen months will be required to complete the English company's iron and steel manufacturing plant, blast furnaces, etc., and they guarantee to the Northern Pacific sufficient traffic to warrant the extension of the coal branch. The Northern Pacific also undertakes within six months to have in operation a short spur connecting the English company's coal mines with the main line, and the latter company will at once build large coke ovens for requirements of their furnaces. Ellensburg people are jubilant in consequence of this intelligence, as all supplies necessary for sustenance of the 2000 men who will be directly employed by the English company, together with the consequent host of camp followers, will of necessity always be drawn from this fertile valley.—*Ellensburg (W. T.) Capital*.

THE Alameda sewer-pipe manufactory is working upon a \$100,000 order from San Diego, and a \$70,000 order from Pasadena.

#### Industrial Enterprises in the Interior.

Nothing more certainly shows the permanency of the new era of prosperity upon which California has entered than the movements in behalf of new industrial enterprises in the interior which are constantly being made. When new and additional manufacturing and mechanical enterprises are being set on foot in interior towns, it is because capitalists have full confidence in the continued and rapid growth of such towns. Ten thousand dollars so invested is worth more to the State and its industrial progress than \$100,000 of speculative investments in land. In fact, it may well be feared lest the numerous large land sales and the high prices which are being realized from such sales may have an unfavorable influence on the growth of the State. It is pleasant, therefore, to consider this other phase of our progress as intimated above. A single mail, a few days since, brought us the following particulars of several new industries which are just now being inaugurated.

#### Novelty Works for Eureka.

The *Eureka Standard* says that H. M. Billings, from Kilbourn City, Wisconsin, has been in that vicinity for some time, investigating the prospects for the establishment of a novelty works industry, and is so well pleased with the result that he has secured a location in that city, and has gone to San Francisco to procure the special machinery required for the business. Mr. Billings will commence operating upon a moderate scale with the intention of adding new machinery and enlarging the business from time to time. The business will consist mainly in manufacturing our redwood bark, burls, stumps and the numerous other varieties of woods in abundant supply in this section, into ornamental, useful and unique articles, which will be sold extensively all over the United States and in Europe, and thus add wealth and prominence to that locality.

The promoter of this enterprise first went to Florida and bought land on which to start an orange orchard. Before doing so, however, he resolved to visit California, with which he is so much better pleased that he has resolved to change his plans as above. He thinks California is far ahead of Florida in every respect.

#### An Ice-Plant for Woodland.

The *Yolo Mail* informs us that ground has been broken on the north side of Woodland near the site of the woolen-mill for the erection of a large ice-plant. The company consists of C. S. Day, D. Hays, L. B. Adams and H. H. Henly, all of Woodland. The capital stock is \$30,000, divided equally between them. The plant is of the low-pressure system, and will have a capacity of about 10 tons daily, and is manufactured by G. W. Stevens of San Francisco. The engine is manufactured by Byron Jackson, San Francisco, and is one of the latest improved automatic cut-off and balanced valve engines. The boiler is of the Hazleton type, and both the engine and boiler will be of sufficient size to run additional machinery should it be necessary to increase the capacity of the plant. The machinery will all be placed on concrete foundation, and money will not be spared in putting in everything first-class and of the most durable kind. The ice will be made of water, thoroughly filtered. The ice will be frozen in blocks weighing as high as 200 pounds each. The company propose to do a wholesale and retail business with headquarters at Woodland.

#### Foundry and Machine-Shop for Pasadena.

The enterprising and growing city of Pasadena, in Los Angeles county, is about to add to its other industrial enterprises a foundry and machine shop. According to the *Pasadena Union*, Mr. John A. Hans is making arrangements for such an enterprise. He asks the city and Board of Trade for certain privileges, and in turn will perform certain things which will result in giving Pasadena a good machine-shop and foundry. The business would not be very extensive at first, perhaps giving employment to 20 men or thereabouts, but the demands of this rapidly growing city will soon have the effect of extending the business to much grander proportions. Of course the citizens of Pasadena will not fail to meet the reasonable request of Mr. Hans, and provide themselves with a much-needed industrial convenience direct at their doors. Hitherto Pasadena has been compelled to depend upon Los Angeles for such work.

#### The Baker Iron Works

In Los Angeles, says the *Union*, "do an immense business. All of the iron columns used in Pasadena are manufactured there. All our street-cars come from Los Angeles, and there are not over a score of them and more coming. These cars need repair and must now be sent to Los Angeles every time repairs become necessary. There are a thousand and one things of this sort which may as well be done in Pasadena as elsewhere."

**A BLAST FURNACE FOR CHINA.**—The Teesik Iron Works Co. of England has secured a contract for the construction of a complete blast furnace plant, with all the necessary machinery, for China. This will be the first blast furnace ever put up in the Celestial Empire, and its progress will be closely watched by the outside "barbarians." All furnaces hitherto in use in China have been of the ancient oriental type, such as have been in use in Asia and Africa for a thousand years or more.

## Passing Events.

The recent rich strike of gold ore between Julian City and the Stonewall mine, San Diego county, may eventually lead to other discoveries. Although the Julian mines have been known for 20 years, no discoveries between the two points mentioned have heretofore been made.

The failure of Wm. T. Coleman has had the effect of causing assignments to be made by the various borax mining companies in Southeastern California and Southwestern Nevada. It is thought, however, that the difficulties will soon be settled.

A good many new strikes and discoveries are being reported just now, as is generally the case in the spring when the prospectors start in for a vigorous campaign in the mountains.

The bullion product of the Comstock is now greater than it has been for some years, and the prospects are that it will still further increase. The mines are now being worked more systematically than ever before, and with more freedom from stock-board influences.

The Chinese of San Francisco are about to build a large hospital for the care of their sick. It is to be free to the poor Ohinamen throughout the States. The Chinese Emperor has indorsed the project. Up to this time \$50,000 has been raised by contributions.

## Wide Distribution of Our Mineral Resources.

In a late number of the PRESS we had something to say about the great variety of mineral products to be found on the Pacific Coast, giving some reasons why these products had heretofore been so little utilized, more especially in California. Continuing this line of remark, it may be observed, this class of our resources is not only greatly varied, but they occur here more widely and evenly distributed, being at the same time more accessible than in most other countries. Elsewhere the mineral deposits, particularly the ores of the precious metals, are apt to be found only in the mountainous districts or in other localities remote from the agricultural and thickly settled portions of the country.

Looking to Mexico, for example, we find most of her mines located far up in the rugged mountains, accessible only by steep and difficult trails, over which mule trains alone can make their way with safety, the same being true, as a general thing, of both Central and South America. In Peru and Bolivia the principal silver mines of the country, the only ones ever much worked, are situated high up in the Andes, the more important of them being above the line of perpetual snow.

Very different is the situation in California as well as in most of the other Pacific States and Territories. In this State our principal gold belt, which stretches along the lower declivities of the Sierra Nevada, has an average elevation of hardly more than 2000 feet, much of it being less than 500 feet above tide-water, and nearly on a level with the great valleys lying to the west. We have gold-bearing bluffs hundreds of feet high so abutting on the ocean that the surf has in time past washed large portions of them away. To the north of these bluffs the sea beach has for a distance of more than a hundred miles been extensively worked for the gold it contained, washing the auriferous sands being still carried on there at a few places.

The foothill region of the Sierra, occupied by our main gold field, is easily accessible in all its parts, its slopes being so gentle that railroads climb it without any trouble. Scarcely any of our metalliferous territory lies at a greater elevation than five or six thousand feet, except some small portions situated to the east of the Sierra Nevada mountains, nor is the highest anywhere very difficult to reach.

As regards the distribution of the various metals and minerals in California, it may be said, there is scarcely a county in the State but contains valuable deposits of one kind or another. Gold mines are being actively worked in 33 of the 52 counties into which the State is divided, and both gold and silver mines in 9 or 10 of these counties. Valuable quicksilver deposits occur in Napa, Lake, Sonoma, San Luis Obispo and Santa Clara counties. The most of these are now being worked, [California being one of the few countries in the world containing cinnabar, the ore of this metal. Copper mines are being worked in Nevada, Calaveras and Amador counties, copper ore being plentiful elsewhere in the State. Heavy beds of borax are found in Inyo and San Bernardino counties, whereat some eight or ten million pounds of this salt are manufactured every year, this being another mineral product rarely met with outside of California. While the most of our petroleum crop is gathered in Ventura and Los Angeles counties, the presence of the earth oils in quantity is indicated at several points along the coast as far north as Humboldt county, also at various localities in the interior.

Boring for natural gas has been prosecuted at a number of places in the State, and at some of them with results that denote a final success. We have asphaltum enough to supply the wants of the world, the principal beds occurring in Santa Barbara, Los Angeles, San Luis Obispo and Santa Clara counties, those farthest separated being hundreds of miles apart, as is the case also with the petroleum and many other of our mineral products. From the chromium deposits of Del Norte to those of San Luis Obispo the distance is more than 500 miles measured in a direct line.

Iron ore in great abundance and of a superior kind, also coal of moderately good quality, occur in at least half a dozen counties in this State. Of the plastic and useful clays, lime and building-stones, cement, graphite, gypsum,

infusorial earth, chalk, asbestos, mica and ochre, we have enough; of salt and soda, overmuch, there being places where there is more of these commodities than is really desirable. Our lead-silver mines turn out a good deal of the former metal. We have beds of sulphur, not very extensive nor at present worked; plenty of rock-coap and some of the ore of antimony, from which a considerable amount of that metal is every year extracted.

While in California these natural products occur in greater variety and are more generally disseminated, probably, than anywhere else in the world, the other Pacific States and Territories are not by any means deficient in this respect. Of the 15 counties in the State of Nevada, there is not one but contains numerous deposits of gold or silver, some of which are being actively worked. There is, in fact, hardly a mountain range in that State, and it contains of these a great many, to which the above remark will not apply. And what is true of Nevada is equally true of Arizona, Utah, Idaho and Montana. Nearly every mountain range in these Territories contains metalliferous veins and other mineral deposits of value, and although little is now being done with them, the time will come when they will all be worked and turned to profitable account, affording aid to many other industries, which, in regions possessing such limited agricultural resources, could otherwise never attain large proportions or even gain foothold at all. And thus these useful metals and minerals, at present so neglected and looked upon as of little moment, viewed prospectively, are of the greatest importance.

## The California Gold Belt.

It begins to look now, after waiting for about 40 years, as if the gold belt of California would be properly examined by trained geologists. This State spent several hundred thousand dollars in trying to get our gold fields investigated and maintained a State Geological Survey for some years. The results were volumes on ornithology, botany, paleontology, and one on geology—not economic. But the features which the miners wanted examined were put off so long that finally, in a spirit of indignation, the survey was stopped abruptly, and the State Geologist sent about his business. He afterward published "The Auriferous Gravels of California," under the auspices of an Eastern college, and few copies are in this State. But the features connected with the quartz mines of California have never been properly examined and reported on. When the State Mining Bureau received an appropriation at the last session of the Legislature, it was stipulated that a certain proportion was to be expended in field work. The trustees decided to investigate first the oil, coal, asphaltum, and natural gas, and the report on them has recently been published. This resolution deferred the examination of the gold mines for another year.

At last, however, it was decided to examine the gold mines. Mr. Melville Attwood is at work on the wall rocks, Mr. O. H. Aaron is investigating the details of gold-ore milling, and other State Mining Bureau assistants have recently commenced on other departments. The U. S. Geological Survey, which did some field work in the gold districts last season, is about to start in for this year. A dispatch from Washington states that "three parties go to the gold belt of California under the direction of H. N. Wilson, with R. N. McKee and A. F. Dunninton as assistants; two to the Cascade mountains in Southwestern Oregon under W. T. Griswold, with Eugene Ricksecker, and three to Montana under E. L. Douglass, with Messrs. Frank Tweedy and E. T. Perkins as aids. These parties are compelled to start at an early date in order to finish the work of triangulation before the summer haze sets in. They will have that done by the 1st of July, and the time from then to the middle of November will be devoted to topography and working out the details of triangulation. The county charts of California are on a scale of two miles to the inch, and of Oregon and Montana four miles to the inch. The California parties will cover about 2000 miles each, and the Oregon and Montana parties from 3000 to 4000."

CARNEGIE has opened a bank for his 10,000 employee in Pittsburgh. He proposes to receive deposits up to \$2000, paying six per cent interest on all deposits.

## Borax and the Tariff.

A member of the firm of Wm. T. Coleman & Co., in speaking of their recent failure, assigns as the principal and immediate cause of that disaster the inability of the house to dispose of their borax property, negotiations for the sale of which were pending and about to be consummated, when the threatened removal of the present duty on that salt caused the prospective purchasers to break off further negotiations.

Now borax has not yet been placed on the free list, nor is it likely to be. A majority of the Committee of Ways and Means in the lower branch of the National Legislature have simply reported in favor of such a measure—that is all. Why then did these proposing buyers of Mr. Coleman's property decline to take it? What was the reason of their so suddenly bolting the transaction, there being, as they must have well known, so little likelihood of foreign borax being admitted into this country duty free? Simply this: Capitalists will not invest their money in a business that is *threatened* in the manner this borax industry has lately been in the Lower House of Congress. It is not, in this particular instance, a change they are so much afraid of as this constant agitation for a change, which, by keeping the market in a feverish and unsettled condition, renders the business of the producer unsatisfactory and precarious. Moneyed men do not care to subject themselves to this sort of annoyance. They will not readily engage in a calling that is exposed to be buffeted and badgered by every callow politician on the hustings, or to be menaced by the cranks who take occasion to ventilate their pet theories in the halls of Congress. It is said that capital is always timid; but it sometimes shows itself prudent as well.

But, after all, it behooves us to inquire what would be the result of placing borax and similar commodities on the free list when the mere talk of such procedure causes so much consternation among proposing investors. "If these things happen in the green tree what would take place in the dry?" If sales of borax properties are to be defeated by such faint possibility of this salt being left unprotected, what could be done with them were the protecting duties actually removed? The industry on this coast would, in that event, have to succumb to foreign competition; such at least is the opinion of our home manufacturers. Mr. Coleman's borax property producing actively is valued at \$2,000,000. What would be its valuation were this production to cease with little prospect of ever being resumed? If anybody is to stand out for a reasonable protection it ought to be, we should think, Mr. Coleman and his creditors.

## Fresno Mines.

We are informed by a correspondent that there is considerable activity in mining and milling at Grub Gulch, Fresno county. The Josephine Company are running a large force of miners day and night. They have a 20-stamp mill with eight Frue concentrators and the latest improved Corliss engine for mill and mine. Their new chlorination-works are almost completed, and the masons are now building a fine reverberatory furnace. The carpenters are putting the finishing touches on a very convenient laboratory. The company have over 100 tons of rich sulphurets on hand ready for treatment. Mr. Little, the resident-manager, seems the right man in the right place.

The Gambetta mine, Mr. John Heley, owner and manager, for some reason is not doing much at present, though he has had a successful and steady run all winter with his little "Donkey mill."

The Antelope and Red Rover were recently sold, and the owners are working a large force of miners in and about the mines, and are putting up a mill and hoisting plant. The Grand Prize and Butterfly, owned by Mr. Pool, are showing fine ore, and a mill will soon be erected. Times are lively, and everybody is at work in and around the camp.

**THE RUSSELL PROCESS.**—A full description of this leaching process, in its practical application and economic results, has been compiled from Mr. Russell's notes by Ellsworth Daggett of Salt Lake. It is published in pamphlet form by the Russell Process Co., New Haven, Conn. This is the most complete thing on this subject ever printed, and will interest metallurgists everywhere.

## Working Auriferous Gravel.

## A New Plan Being Tested.

We have made brief mention of the fact that Mr. Gideon Frisbee, one of the inventors of the Frisbee-Lucop mill, has devised a plan for working auriferous gravel dry, which is being tried in this State, and are now able to give further particulars. By the plan proposed, after the cement or gravel in the bank is broken up in the usual way, or gravel taken from the drift, it is loaded into cars by hand, or automatic power-shovel, run to the mill. Here it is dumped into the upper end of a rotary grizzly 16 feet long by 4 feet inside diameter, formed of iron or steel bars four inches wide and 1½ inches thick, set radially with their edges toward the center, with spaces between the bars of five-eighths of an inch, the whole cylinder resting on rollers. It has one end lower than the other, and is revolved at the necessary speed by suitable gearing. The cement is tumbled over and over, the bowlders contained breaking up and disintegrating the mass which is all the time traveling toward the lower end. The finer portion is discharged between the bars, and the coarser, which carries no gold, is discharged from the lower end into cars, removed and dumped.

The fine matter passing through bars falls into an ore-bin from which it runs to a wet mill and is reduced so that all will pass an eight-mesh screen. This makes it fit to pass over plates without scouring off the amalgam, and brightens the rusty gold. After this it passes over plates in the usual way, or may be saved by any of the usual appliances for saving gold in quartz mills.

The wet mill has a capacity of 100 to 150 tons per day through an eight-mesh screen, and as but one-tenth, or possibly less, of the total amount of gravel will be worked over plates, it is only necessary to have sufficient capacity in grizzlies to work 1000 or 1500 tons per day.

The removal and working of such an amount by dry process may seem difficult, but larger amounts of rock are being worked by a more expensive process (for other purposes) at a cost of five cents per ton. Mr. Frisbee is of the opinion that the method of working gravel is as cheap, taking everything into consideration, as by the hydraulic process. He is also confident that two or three times as much gold will be saved. As for milling, it is all coarse gold and easily caught on the plates. No objection can be made on account of debris run into streams, as all coarse stuff is run to a dry dump and only mill-tailings run off by water. The claims made for this method of working gold gravel are its simplicity, small cost of plant, and the much greater saving of gold, the waste and loss by hydraulic being very great.

## Measuring Quartz Screens.

We have been shown one of Mr. Melville Attwood's micrometers (not patented), designed for the use of quartz-mill superintendents. It is a very small vest pocket instrument by which the diameter of the apertures in different punched, slot and wire screens can be measured with tolerable accuracy. For instance, the diameter of the aperture in a No. 50 brass-wire screen is shown by it to be only the one-hundredth of an inch, and No. 5 punched screen, three-hundredths of an inch. In a No. 8 slot screen the diameter of the slot is two-hundredths of an inch. The little instrument costs but a trifle and is quite useful. It is being made by Leitz & Co. of this city. In appearance it is similar to the little glasses used for measuring the threads in cotton goods, but there is a scale engraved upon it which adapts it to the new purpose. By it can also be told the number of holes to the inch in any screen, and small grains of quartz may also be measured by it. Those mill superintendents who are particular in their work will find this little instrument a very handy one for the purposes indicated.

SENATOR STANFORD offered an amendment to the River and Harbor bill in the Senate, increasing the appropriation for the improvement of Oakland harbor from \$200,000 to \$500,000. Both Stanford and Stewart propose to insist upon this amendment, believing that the work at Oakland should be performed at once, and that the demands of trade warrant the expenditure immediately of the full amount recommended by the engineer.

## Exchequer Mining District.

EDITORS PRESS:—I would like to hear from some of your readers an explanation of the geological formation of this district, so as to learn if it has any resemblance to any other district in this State or in the adjoining States or Territories.

The principal characteristic and a decidedly prominent one is its dyke formation. The dykes cut the granite east and west nearly, with a very slight variation. The district is about 3 miles long and about 2½ miles wide, where mineral-bearing veins have been found. The principal mine seems to be a

## GEOLOGICAL FORMATION IN EXCHEQUER MINING DISTRICT.

blow-up of ore of a "chimney" character, although no large bodies of ore have been found. No shaft has been sunk more than 60 feet. This shaft was sunk on one of four veins 20 feet apart, both walls in granite, until at the bottom of the 60 feet, where a six-foot vein was apparently cut clear off and butted against a perpendicular wall of porphyry slightly inclined to the south. The following figure would represent a cross-section running through the incline, which dips at an angle of 45°. The porphyry contact is soft and resembles talc, and gives only a trace of silver.

The vein dips about 6 feet in 20 going west at bottom of incline. At A there would be

the corrugations of which are so close as to be nearly imperceptible. The writing on the stencil sheet is done with a smooth steel stylus, which is about the size of a well-sharpened lead pencil. The paper is perforated from the under side, leaving the stylus free to roam at the will of the writer; the corrugations on the plate affording just enough resistance to the pen to prevent slipping and make the writing easy and natural.

The accompanying cuts show the appliance and method of application. After the sheet is written it is stretched on the frame. The sheet on which the copy is to be made is placed on a pad beneath, the frame closed, and an inked

## EDISON'S MIMEOGRAPH.

only a few feet depth of vein, and west of the incline the vein increases in depth, as stated above. Shall I look for ore in the porphyry or follow the vein going down west? Fifty-one tons has been shipped—40 from incline and 11 tons on the croppings going west, giving 44.25 per ton average assays. In the incline it gave \$7000, \$1823, and as high as 1027 ounces silver and 180-100 ounces gold, on the south vein, from croppings, and from 1 to 300 ounces on the middle veins in spots. Pieces of ore have been picked up weighing 23½ pounds, assaying 421 ounces silver and one ounce gold, and one piece 724 ounces silver and 90-100 gold. A number of veins assayed from 1000 to 3000 ounces, but gave out or were cut off by porphyry at depths of 10, 12 and 20 feet in hard porphyry. The four veins have not been opened down to the porphyry contact, except the north vein, which was 60 feet in length. I think a description of underground work showing positions of veins, faults, slips and dykes, would be very instructive as well as entertaining. This district is eight miles north of Homer station, on the A. & P. R. R., in San Bernardino county.

PROSPECTOR.

THE American Institute of Mining Engineers holds its 51st meeting at Birmingham, Alabama, on May 15th.

## The Mimeograph.

The mimeograph is a new appliance invented by Thomas A. Edison, to take the place of the electric pen, also invented by himself. It is intended for manifolded autographic and typewriter circular letters, quotations, reports, specifications, copying music, programs, etc. The writing can be done with the same facility as though pencil or pen were used on common paper. As many as 3000 copies can be made from an original.

The manner of making the stencil or first writing is very simple. A sheet of thin sensitive paper is laid over a finely grooved steel plate,

## The Sutro Tunnel

An adjourned meeting of the Sutro tunnel stockholders was held Friday of last week for the purpose of electing a Board of Directors. H. G. Sieberst, one of the stockholders, said that under the code the adjournment had not been legally ordered, and any election then would be invalid. Edmund Tansky maintained that the meeting was convened in accordance with the by-laws. There was considerable discussion, some of it of quite a heated nature.

The Landers-Sieberst party withdrew, and the Lillenthal-Tansky men, claiming to represent 1,117,899 shares out of 2,000,000 shares in the corporation, elected the following as their Board of Directors for the ensuing year: Theodore Sutro, P. N. Lillenthal, H. H. Thayer, F. A. Benjamin, M. B. Clapp, George E. Butler and Edmund Tansky. At a subsequent meeting Theodore Sutro was appointed president; P. N. Lillenthal, vice-president; Pelham W. Ames, secretary; C. C. Thomas, superintendent; Anglo-California bank, treasurer; H. H. Thayer, assistant secretary and New York transfer agent; Theodore Sutro, attorney and counselor; California Safe Deposit and Trust Co., San Francisco and California registry, and Union Trust Co. of New York the New York registry. Secretary Pelham W. Ames refuses to give up the books of the corporation to either party until he has obtained legal advice.

Since then John Landers, Moritz Meyer and Frederick Roeding have brought suit in the Superior Court against the Sutro Tunnel Co. to set aside the election held on the 4th inst., at which it is alleged Theodore Sutro, H. H. Thayer, M. B. Clapp, G. E. Butler, E. Tansky and P. N. Lillenthal were chosen directors, and the secretary was instructed to cast the vote of 1,117,899 of the shares for them. The complaint specially declares that all of the 1,117,899 shares represented and voted by P. N. Lillenthal as proxy were owned by others, and that, in fact, ten shares were all that could be voted by persons present.

THE Hale and Norcross paid \$56,000 in dividends this month, the first dividend for many years. The record of the mine is as follows: Total assessments levied, \$5,086,800; total bullion product of mine, \$3,374,224; total dividends, \$1,654,000. So whatever was the cost of the work, upward of \$8,000,000 of new wealth has been added by this mine. The assessment money merely changed hands, and was not lost. There are \$3,000,000 in circulation more than there were before the mine was opened, and this money is distributed among the people.

ROBERT J. STEVENS, United States Consul at Victoria, in a letter to the State Department says: "There is a division here as to the employment of Chinese, even among the miners, as many of them are paid by the ton of coal that they mine, and they sometimes realize \$4 and even \$5 per day. These men employ Chinese at \$1 or \$1.50 per day to shovel and load vans, and sometimes even as tamers. The white miners perform but very little heavy labor themselves."

COAL shows no change; receipts in April were 94,550 tons, making a total thus far this year of 332,750 tons, against 341,000 tons during the same period in 1887. Supplies continue light and prices firm. The coast collieries are increasing their output, but there is a marked falling off of shipments of foreign grades. For house purposes, the consumption is lighter, but our manufacturers are all running full time, most of them being in arrears with their orders.

W. A. CLARKE, owner of the Butte Reduction Works, has ordered from Fraser & Chalmers of Chicago a full equipment of the most modern and approved machinery. He will increase the capacity of his already big plant to 200 tons per day. The works will be driven by a 100-horse power Corliss engine and lighted by 100 incandescent lights. The cost of the same will be nearly \$100,000.

At the meeting of the California Academy of Sciences, on Monday evening last, Prof. Joseph Le Conte read a paper on "The Most Probable View Regarding the Interior Condition of the Earth."

THE receipts of quicksilver in April were 2289 flasks, and for the first four months of 1888, 9437 flasks, against 7938 for the same time last year. The exports for the four months were 5164 flasks, against 5143 for the same time last year.

## MECHANICAL PROGRESS.

## Breaking of a Large Steam Engine.

The havoc produced by the breaking of any important portion of a large steam engine was most vividly illustrated when one of the largest condensing beam engines in Brooklyn, N. Y., was running recently, apparently in perfect order, when suddenly there was a sharp snap, then a general grinding of heavy iron, steel rods and bars, and the powerful engine was destroyed.

The engine was in the jute manufactory of Buchanan & Lyall, which is on President, between Hoyt and Bond streets. The engineer who was in charge of the engine was just about to stop it for the day when the crank pin strap broke. This strap is a piece of wrought iron six inches wide and four inches thick, which connects the crank by means of the connecting rod to the walking beam. The connecting rod was thus loosened at one end and went flying about, wrecking everything it touched. The 50-inch piston was thus released, and it descended to the bottom of the cylinder and cracked the lower head. The force of steam sent the piston up with great violence, and the upper head of the cylinder was also cracked and torn off. The engine-room soon became filled with steam, and the work of destruction continued. The connecting rod in its descent struck a large brace, and thus made a lever of the walking beam that was being forced down with tremendous power. This force and resistance snapped off the three-inch bolts which hold the caps to the upper part of the galloways frames, and the frames, which were four inches thick and six inches wide, were broken to pieces. Large pieces of the wrecked engine were hurled in all directions, and everything in the room was more or less damaged. The plunger pump was a total wreck, and the air pump rods were broken as though they had been straws.

The engineer and his fireman stood bravely at their posts, and although the room was filled with steam, through which 100 pound chunks of metal were flying in all directions, they managed to reach the stop valves on the boiler and cut off the steam from the broken engine. The momentum of the big fly wheel was enough to keep the broken shafts and rods in motion for a few minutes after the engine had been a total wreck, and the broken pieces continued to smash things until at last they lost their power and quieted down like an expiring demon.—*Ec.*

## Boiler Management.

A correspondent of the *American Machinist* writes upon the subject of boiler management as follows: There are engineers and steam-users who pay no attention to holding steam over night. Perhaps in no other way will so small an amount of work repay one so abundantly and so quickly. Of course, the direct return is fuel saved, while the indirect (and not the least) is the increased life of the boiler by reducing very largely the expansions and contractions. One would suppose that this would be a stale truism, yet the fact remains that a great many stationary boilers are easily neglected in this respect.

I give an experience for the benefit of whom it may concern. I took charge of an old plant. No damper; furnace doors out of shape and the walls leaking. I put in a good-fitting damper, and refitted the doors so they shut tight. The result was, it held steam until midnight. Then I took fire-clay mortar and went over the walls, inside and out, and then could hold steam easily. Have 20 pounds of steam at 6 A. M.; do not bank any fire; and lastly, save 200 pounds of coal daily over the other practice.

When it is impossible to put in a good damper, owing to the shape of breeching, take a piece of sheet-iron and cut it out to fit the front head, so as to cover all the tube ends. It should be stiff enough to stay flush up to each tube. A pair of side braces, swinging from a rivet, may be put in so as to hold the cover in place. By putting in this cover, after shutting down, one can easily hold steam.

I wonder how many boilers get the fire surface of the shell cleaned except when down for repairs. I saw one bright fellow—now retired—use the hose, but I don't think it did the wall any good. To clean properly nothing is better than a wire brush. There is nothing prettier about the job, nothing that makes your helper desire to wade in and earn glory, and generally he has business somewhere else at that time. Using soft coal and shavings, I find it pays to clean the shell every two weeks. It is also an excellent time to observe this or that steam, rivet or tube, and thus be able to detect any new defect, and one will sleep better, having done his whole duty.

**MODERN WARFARE.**—The *American Machinist* says that the prosecution of modern warfare has settled down to a contest of mechanicians. Hereafter personal bravery and strategy will play a second part in warfare, and mere numbers will count less than ever before. The nation whose mechanicians furnish the best guns and equipments of war, and make impenetrable vessels and forts, will win the battles. Even peace is an expensive luxury in these times, when the earnings of the multitude must be spent to keep up the semblance of an invincible front. But, after all, it is better

that the mechanicians of the world shall settle battles. There is sure to be fewer battles, because the chances of success can be better weighed beforehand. And in the processes of building war-ships, armored forts and guns, there is a possibility of learning something useful and of general application. Let the mechanician come to the front, by all means. It is better that the contest be one of mechanical skill than one of mere weight of numbers. It is better in every way to spend money in preventing than in prosecuting war.

**SUPERHEATED WATER FOR MAKING STEAM.** A company has recently been organized in Boston for distributing superheated water, which, after being conveyed to a distance, is instantly converted into steam for running engines. The *Boston Journal of Commerce* is employing water so heated for running its engine. The boilers which furnish the water are located several blocks away, and for several days, says the *Journal*, there has been no fire in our building for either heating or power purposes. This is the first power plant which has been run by this system in this city, and its practical success exceeds all expectations. Our 6½ x 8 Armstrong & Sims' engine runs quietly along at 300 revolutions without any symptoms of entrained water, and, whatever the changes of load, the gauge by its side varies scarcely perceptibly from 70 pounds, at which it is set. The boilers at the station are run at a pressure corresponding to 400° F., and the water at this temperature is circulated through the mains. Service pipes lead to a "converter" placed in our basement, where the pressure is reduced, in our case, to 70 pounds, a portion of this water being above the temperature, due to that pressure, is converted into steam, and the supply of water is controlled automatically, so as to maintain the desired pressure in the condenser, from which the steam supply from the engine is drawn, just as from a boiler. The manifold advantages from this system are obvious, and if found practical after long experience, will prove the greatest convenience since the introduction of gas-mains and their service pipes.

**THE DESIRABILITY OF REGULAR MOTION FOR MACHINERY.**—It is always desirable that the motion of a machine should be regular. Even supposing that the first mover is perfectly constant and equal in its actions, the machine may not be regular in its movement, from the irregularity of the resistance to be overcome. But still, says a contemporary, if both the power and the resistance were perfectly regular, the machine would not be perfectly uniform in its motion, for there are particular positions in which the moving parts of a machine are more efficacious than others, as in the crank, for instance; hence the energy of the first mover will be unequally transmitted, and irregularity in the motion of the machine will constantly follow. The motion of some machines bears a constant tendency to accelerate, others to retard; and others alternately to accelerate and retard; and, perhaps, in no case whatever can the motion of a machine be said to be perfectly uniform; but common sense will point out the necessity of having the motion as uniform as it can be made, else it will increase in proportion as it is multiplied through the machinery.

**TUBES FOR BELLS.**—It has been found that brass tubes, when properly annealed and suspended in a vertical position from a point near the top and struck at a point above the point of suspension, have resonant qualities far superior to bells, especially when comparative weight and cost are considered. This fact has been made the subject of a German patent, and tubes are being used there for chiming in church towers. Walter H. Durfee of Providence, R. I., who makes fine hall clocks, is making use of these tubes for chiming, which are rung by the clock movement at regular intervals, and while in his shop recently we saw some clocks in which surprising results were attained in point of purity, clearness and volume of tone, by their use. Some idea of the comparative efficiency of tubes for the purpose is obtained from the fact that a tube three inches diameter outside and one-half inch thick, twelve feet long, can be easily heard at a distance of one mile, and under favorable circumstances two or three miles.

**SULPHUR AND SALT IN BOILERS.**—Water containing sulphur and salt will so act on iron as in time to make it soft as "black lead," and may therefore be considered injurious to a boiler. A good lime-extracting heater should be used when the employment of such water cannot be avoided. Salt water, similar to that of the ocean, will not injure an iron boiler, but if a high pressure is carried salt will be precipitated. When salt water boils, fresh water is evaporated and salt remains, in the proportions of 36 parts salt to 100 parts of water, after which the salt will be deposited in the boiler. The use of a Salinometer (an instrument to determine the strength of brine or salt water) is recommended, in order that the superheated water may be blown off and extra feed-water introduced.

**RAILROAD SPEED IN ENGLAND.**—It is stated that railway trains in England are now driven at an average speed, which is 14 per cent higher than it was 20 years ago, with scarcely any more than half the quantity of coal.

## SCIENTIFIC PROGRESS.

## The Telephone an Old Idea.

It is said that the principle of the telephone has been known in India for 2000 years. Mr. Fred Amesbury of New York, who has just returned from a two years' sojourn in that country, says that the communication is confined entirely to the temples, the natives believing it to be the "governing spirit." The wire was some kind of metal, but neither steel, copper nor brass, although it closely resembled the latter. The transmitter was of wood, and about the size of the head of a flour-barrel, and to establish connection, instead of ringing a bell, the person wishing to attract attention at the other end stood close to the curious-looking thing and shouted: "Ooey! ooey! ooey!" The sound is faint, but distinct. The telephone which Mr. Amesbury describes has been in use 30 years, and he was shown worm-eaten transmitters and conduits that must have been 200 years old.

We are not told whether the wires then used were charged with electricity. Probably they were not—at least they could not have been until within the last 50 years. The principle of the telephone—minus the electric current—was used a hundred years ago in Mexico, and was a well-known parlor pastime in this country years before Bell thought of applying the electric current to it. Common strings, stretched from room to room in a straight line, held taut by knots at either end and fastened to the bottoms of two tin-cans, furnished the entire apparatus—the cans being used as transmitters and receivers. Conversation can be readily carried on by such a simple device for the distance of one, two and three hundred feet—depending upon the character of the strings used, the condition of the atmosphere, and the more or less perfect manner in which the device was put together. Wires were used for longer distances and more perfect work. The writer experimented and amused himself and friends with such an apparatus years before Bell made his invention. Mexican bandits had them strung across ravines and from hill to hill, to more readily communicate with each other in their nefarious business. The wonder is that some one did not utilize a well-known principle years before Bell thought of it.

## Colored Photography.

The persistent experiments of scientific photographers to produce photography in colors have resulted, of late, in some decided successes in that direction. The latest advance in this direction which has come under our notice has been made by Mr. J. E. Mayall, 164 Bond street, London. Mr. M. has been experimenting for many years, and has so far progressed in the details of his process that his color pictures are now reported as presenting beautiful specimens of this new departure in photographic art. Mr. Mayall, after 14 years of experimental research, has discovered the art of reproducing the colors latent in the negative of the photograph, having arrived at his discovery by the aid of spectrum analysis, which led him to the conclusion that every color in the organic world, when exposed to a suitable photographic plane in a camera, registers exact vibrations. He has succeeded in producing chemical colors extremely attenuated, which exactly correspond with the vibrations in the negative. In doing this he keeps the film alive to the smallest vibrations of light. He uses, firstly, lactate of iron to impregnate the isinglass film with a salt of iron capable of uniting with any stronger organic acid; and secondly, meconic acid, which impregnates the film of albumen, and has a stronger affinity for iron than lactic acid. It unites with the iron, and forms a red film, which is in a state to receive all the lower vibrations of the red end of the spectrum, and this gives these lower vibrations a fair chance with the electric light. All subsequent processes assist this chemical march to the final end of making a print that will take up colors, which, when added, fall in their places, and there remain indelible and unalterable. An inspection of Mr. Mayall's productions recently took place at his studio, one of the special features of which was an extended and perfected system of electric light, which consists of three 6000 to 10,000-candle power are lamps for photography by Mr. Mayall's new process. The reception-rooms, studios and entrances are fitted with 50 20-candle power glow lamps, the whole constituting an establishment well worthy of the new process which has been thus publicly inaugurated.

**PRESERVATION OF FLOWERS.**—A method of preserving the natural colors of flowers, recommended by R. Hegler in the *Deutsche Botanische*, consists in dusting salicylic acid on the plants as they lie in the press, and removing it again with a brush when the flowers are dry. Red colors in particular are well preserved by this agent. Another method of applying the same preventive is to use a solution of one part of salicylic acid in 14 of alcohol by means of blotting paper or cotton wool soaked in it and placed above and below the flowers. Powdered horacic acid yields nearly as good results. Dr. Schönlund, in a paragraph contributed to the *Gardeners' Chronicle*, recommends, as an im-

provement in the method of using sulphurous acid for preserving the color, that in the case of delicate flowers they might be placed loosely between sheets of vegetable parchment before immersion in the liquid, so as to preserve their natural form.

**GASEOUS EXPLOSION OF PLATINUM.**—The curious fact was some time ago brought to light, says *Nature*, by Nehrwald, that solid particles are ejected from a platinum wire glowing under the influence of an electric current, and form a metallic incrustation upon the walls of a glass tube by which the wire is surrounded. The cause of the emission of these solid particles of platinum has, however, until recently, remained a complete mystery. In the number of the *Annal der Physik und Chemie* just received will be found an interesting paper by Dr. Alfred Berliner, who, in the course of a series of experiments upon the occlusion of gases by platinum and palladium, has discovered the source of this singular phenomenon. Thin strips of platinum, before being charged with the gas under experiment, were inclosed in a narrow glass tube, and freed from all occluded gas by being heated to redness, *in vacuo*, by the passage of a constant electric current for several hours. At the expiration of this time the metallic incrustation was invariably found when occluded gas has been evolved. On charging the strips with various quantities of any particular gas, the amount of any incrustation formed after the complete expulsion of the gas in each experiment was found to vary in the same proportion. Hence it appears pretty clear that the evolution of gas is necessary for the emission of solid particles. This result is strongly confirmed by the fact that palladium, which has such a remarkable power of occluding gases, produces a similar incrustation much more readily and at a lower temperature. It appears probable that the action is merely mechanical, that we have, in fact, an immense number of microscopic volcanoes or solfatarae, evolving the occluded gases with such energy that portions of the crater walls are detached and carried away by main force, like their brethren on the large scale, the scorias and lapilli, to distances very considerable in comparison with the size of the vents.

**WHAT THE EAR CAN INDICATE.**—A well-trained ear is of great assistance whenever there is anything going wrong in the way of machinery, as there is always a slight discord somewhere that will quickly attract attention if the ear has been cultivated for it. The slightest squeak cannot be covered up by the heaviest clatter, and the least disturbance in the way of noise changes the tone of the racket very perceptibly after one becomes accustomed to the sound made by each piece of machinery. How quickly the ear will indicate whether the blows of the hammer are doing any work or not. It is used in testing car-wheels and has been carried so far by boiler-makers as to point out the places where their boiler iron has crystallized. The woodworker can tell by the sound of a few blows where floor joists are to be found beneath the floor, and would never think of driving a nail in the wall without sounding for a solid bearing. There is no need of driving for a long while on a shaft to see if the gear-wheel is going to start, as the sounds speak in plain language that it is "no go," and the same thing holds good in driving parts of machines in place. A grating sound ought to indicate there is grit somewhere, but we have seen nicely fitted work put up and set to running without any notice of anything wrong in this respect, when each separate grain of grit could be distinguished by a careful ear. The man at the forge can tell quite accurately by the tremble of the tongs when a tool he is trying to harden has cooled one-half way through that he may use the heat in the remaining portions for drawing the tool to a temper.—*Ec.*

**MAGNETISM IN METALS.**—"Mr. Shelford Bidwell (Royal Society, March 1st) is continuing his admirable researches in the changes produced by magnetism in the lineal dimensions of the different magnetic metals," says *Nature*. "He finds that iron, which first expands with the magnetizing force, soon reaches a maximum point, whence it contracts until it attains its original length; but, on still further increasing the magnetizing force, it contracts until it apparently reaches a minimum point, beyond which his means have not enabled him to proceed. Bismuth appears to continually expand, nickel to continually contract; while cobalt contracts, reaches a minimum point, and then expands, approaching its original length. Manganese steel was unaffected. His apparatus was so perfect and sensitive that he could read a variation of one hundred-thousandth of a millimeter."

**HIGH WATER PERIODS IN THE MISSISSIPPI VALLEY.**—Some one has discovered that high water periods come and go in cycles of seven years in the Mississippi valley. It was in 1881 that there was the last high water in the Mississippi, and log-owners were apprehensive that some of the logs stored in booms north of Minneapolis could not be taken out. But the high water came at the period of seven years after the next previous high water. This year is another high water period, and it is confidently expected that the spring freshets will prove unusually heavy from the melting of the snows which have fallen the past winter in such unusual quantity, and have lingered so long in the lap of spring.

## GOOD HEALTH.

## Disinfecting Consumptives.

A new method of treating pulmonary consumption is described by the *Medical Record* from French sources. Sulphureted hydrogen was one of the alleged curative agents in the Bergeon treatment by gaseous enemas. The French experimenters have discarded that method as one of doubtful utility, but they seem determined to fill their patients' lungs with sulphur in some form. Their new system of curing consumption is based upon sulphuric acid in mediated inhalations. Sulphur slightly moistened with alcohol is burned in a brazier, a little benzoin or powdered opium being sometimes added to make the fumes less disagreeable. The patient is required to stand twice a day in this sulphurous chamber and inhale the medicated atmosphere until his lungs are saturated with sulphuric acid. The treatment is said to have been markedly successful in as many as 30 cases, awats and fever disappearing, the lungs clearing up and the appetite and weight steadily improving. M. Dujardin-Beaumez, who has been favorably impressed with the reports made in these cases, has tested the method practically, and greatly benefited, if not cured outright, seven patients. Into his sulphurous chamber fresh air is admitted from time to time, the patients being more mercifully dealt with than in the original experimenting-room.

This method of treatment is said to have been suggested by the experience of a soldier in the last stages of consumption. He was employed in disinfecting barracks and was obliged to pass nine hours a day in a sulphurous atmosphere. Although his condition had been pronounced hopeless by hospital authorities, he completely regained his health in 65 days. The sulphur burned for the purpose of destroying the germs of contagious disease in the infected barracks had a similar effect upon the tubercle bacilli of his own lungs. This is the practical explanation which the scientific followers of Dr. Koch offer of the success of this singular method of treating phthisis.

**FLORADOR.**—This is the name given to a new food prepared from the best products of selected wheat. It claims to be a chemically perfect food, possessing all the constituents necessary to nourish the human body. As a nutrient, wheat, it is well known, takes much higher rank in the hierarchy of cereals than sago, rice, maize, or corn flour and tapioca. These are simply starches or fat-formers, while wheat possesses a great percentage of flesh-forming constituents. All these are retained in florador, which is prepared from the best wheat by a new process, and by special machinery designed to ensure the retention of the delicious aroma of wheat as well as its nutritive qualities. It possesses also the important quality of being easily digested, which, to a large class of persons, and to invalids, will alone ensure for it a hearty welcome. Even when cooked without milk or eggs it is light and palatable, making delicious porridge. It is made in three grades or sizes, large grained, medium and fine. The first is well suited for porridge, and as a substitute for macaroni or vermicelli in soup; the second will, to a large extent, take the place of flour for making hoiled puddings and for baking an especially wholesome bread; and the third, or fine grained, is most suitable for blancmange and similar preparations in molds, and for cakes, biscuits, and fancy bread. The new food is put up in elegantly labeled packets and tins; and in view of the special advantages which it possesses over other and similar foods now in the market, there appears to be little room to doubt that it will be a great and signal success among the novelties of the year. It is manufactured by the Florador Food Co., Glasgow, and 11 Southampton street, London.—*British Trade Journal*.

**THE BODY AT CLOSE OF WINTER.**—A medical view of the month of March is given by a physician in the *American Magazine*. He says: "Never does lettuce or spinach or a new potato taste so delicious as during this month, while yet winter holds in strong grip the shivering days and gives a vicious kick whenever he gets a chance. Never is such food more needed; for our blood is heavy with a debris, the acids of restrained excretion. Shut by triple bars of cold, skin emunctories—microscopic sweat-tubes—no longer perform their office freely; only insensate perspiration can pass, itself too often clogging up the means of escape when regular bathing has been neglected."

**SCARLET FEVER GERM.**—Patient and long-continued experiment and observation by the distinguished physician, Dr. Klein, seem to have thoroughly demonstrated that scarlet fever is induced by a germ, or microbe, micrococcus scarlatine, which is formed in the milk of cows affected by a certain disease. The same microbe is obtained from the disease cow, from her milk and from patients suffering from scarlet fever. Fortunately the infectious property of the milk can be destroyed by heating it to 185° Fah. This precaution should never be neglected when scarlet fever is prevalent.

**THE USE OF BEER.**—In many minds there is a mistaken notion in relation to the effect of beer on the human system. Because those who use it largely often become fleshy, and appar-

ently healthy, the conclusion is reached that it is a wholesome. The *Scientific American*, a high authority, thus expresses itself in relation to the matter: "For some years a decided inclination has been apparent all over the country to give up the use of whisky and other strong alcohols, using as a substitute beer and other compounds. This is evidently based on the idea that beer is not harmful, and contains a large amount of nutriment; also that bitters may have some medical quality which will neutralize the alcohol which it contains. These theories are without confirmation in observation of physicians. The use of beer is found to produce a sort of degeneration of all the organs; profound and deceptive fatty deposits, diminished circulation, conditions of congestion and perversion of functional activities, local inflammation of both the liver and kidneys being constantly present. Intellectually a stupor amounting almost to a paralysis arrests the reason, changing the highest faculties into a mere animalism, sensual, selfish, sluggish, varied only by paroxysms of anger that are senseless and brutal. It is our observation that beer-drinking in this country produces the very lowest kind of inebriety, closely allied to criminal insanity. The most dangerous class of ruffians in our city are beer-drinkers."

**HOW FINGER NAILS GROW.**—The growth of the nails is more rapid in children than in adults and slowest in the aged. It goes on more rapidly in summer than in winter, so that the same nail that is renewed in 132 days in winter requires only 116 in summer. The increase for the nails of the right hand is more rapid than for the left; it also differs for the different fingers and in order corresponding with the length of the finger. It is most rapid for the middle finger, nearly equal for two either side, slower for the little finger and slower for the thumb.

**NASAL TUMORS.**—Apyrexia is the name Dr. Guye of Amsterdam chooses for inattentiveness, and he quite singularly finds that the nose is the cause of it. A dull boy became quick to learn after certain tumors had been taken from the nose, and a man who had been troubled with vertigo and buzzing in the ears for 12 years found mental labor easy after a like operation. In a third case a medical student was similarly relieved. Dr. Guye supposes that these nasal troubles affect the brain by preventing the cerebral lymph from circulating freely.

## USEFUL INFORMATION.

## Wood Pulp for Building.

An important discovery has just been made at the Sognedal Pulp Factory in Norway, after several years' experimenting, wood pulp being used for the manufacture of the kinds of building ornaments which are generally made of plaster-of-paris. The pulp is first ground from wood, and then, by a machine, pressed into any kind of an ornament, such as ceilings, bas-reliefs, rosettes, etc., which are quite as well finished as similar articles in plaster-of-paris. Another feature is that the articles made from the pulp show painting or gilding to great advantage. Tests have also been made with regard to their strength, by dropping them from various heights or hurling them against stone walls, the results being highly satisfactory. Thus, for instance, a bar of this material one foot in length, one inch in thickness and five inches in width neither broke nor sustained any serious injury on being hurled with full force against a stone wall a couple of yards distant. Naturally, too, this material is far lighter than plaster-of-paris—an important advantage, as no great harm would be caused to a person by ornaments made from it falling upon him, which is otherwise with those made from plaster-of-paris. It should also be mentioned that pulp ceilings, friezes, etc., are, by the hardness and compactness of the material, impervious to wet, and that they may, if desired, be fastened by nails or screws. Finally, the inventors state that ornaments made from this material cost only half the price of similar ones made from plaster-of-paris. This discovery will, it is believed, give great impetus to the pulp factories of Scandinavia, which are now almost unprofitable through the lower prices of paper prevailing abroad, and the utter failures which have attended the vast production of the latter, direct from wood pulp, by a firm in London.

**MILLING VS. PLANING METALS.**—There seems to be some considerable controversy among mechanics in regard to the comparative merits of milling and planing machines. A correspondent of the *American Machinist* is alluding to some adverse comments on the use of the milling machine, says: "You are probably aware that I am a strong advocate of the milling cutter for all machine-shop work, where it is possible to use it; and I had an idea that most of our master machinists had a similar liking for this tool. There is a well-known company in the Eastern States who have been using 16 planers for the past 20 years, and are now about to adopt the heavy milling machine system in place of the planer. In other words, there will be but three or four planers in their establishment, the others being replaced by seven special milling machines. This plan was

decided upon after many comparative trials of the two systems, working in both wrought and cast iron. I think there must be something wrong about Mr. Johnson's experience with milling machines, and this may not be his fault; for if the machines used by him were not designed with a rigid structure, then failure was the most natural result." Mr. Conradson strikes the nail on the head when he says, "The chief reason, in my opinion, that the milling machine is not used more extensively is this—the proper machine has not been put on the market. The average milling machine has a spindle much too small; the table is too shallow; the bed is weak; the driving-power fails on heavy cuts, and the feed is a complete failure."

**FILLING CRACKS AND WORM HOLES.**—A correspondent of the *London Mechanic* recommends sawdust or raspings of hard and soft wood for filling the cracks and worm holes in old furniture, which he says he learned from Oriental carpenters. The sawdust is sifted through wire gauze, and each kind kept by itself. He says: "For a crack, a worm-eaten hole or a deep flaw prepare the proper dust by the admixture of brick-dust in flour (also kept ready), or whitening, or ochre, or any required tint. Then take well-cooked glue, and, on a bonse plate, stir it in slowly while hot with sufficient powder for your work. Dip the hole or crack with your glue brush, then with a putty-knife stir about the mixture on the plate, taking care you have the right color. When sure on this point, take some of the cement on the end of the knife and insert it in the desired place. Then use as much pressure as you possibly can with the blade, and keep smoothing it in. Sprinkle a little of the dry powder on the spot. When thoroughly dry, sandpaper the surface with an old piece, so as not to abrade the joint. You can then varnish the mending. Where weevil and woodworms have devoured the furniture, cautiously cut out the part till a sound place be reached. Poison the wood with a solution of sulphate of copper injected into the hollow. Let it dry. Cut an angular piece of the same wood from your board, and with a sharp chisel make a suitable aperture for its reception. Fix it with glue. When thoroughly dry, work with carving-tools or rasp and glass, scraping until the new bit of work exactly matches the old."

**WAXING HARDWOOD FLOORS.**—Take a pound of the best beeswax, cut it up into very small pieces, and let it thoroughly dissolve in three pints of turpentine, stirring occasionally if necessary. The mixture should be only a trifle thicker than the clear turpentine. Apply it with a rag to the surface of the floor, which should be smooth and perfectly clean. This is the difficult part of the work, for if you put on either too much or too little a good polish will be impossible. The right amount varies, less being required for hard, close-grained wood, and more if the wood is soft and open-grained. Even professional "waxers" are sometimes obliged to experiment, and novices should always try a square foot or two first. Put on what you think will be enough, and leave the place untouched and unstepped on for 24 hours, or longer if needful. When it is thoroughly dry, rub it with a hard brush until it shines. If it polishes well, repeat the process over the entire floor. If it does not, remove the wax with fine sandpaper and try again, using more or less than before, as may be necessary, and continue your experimenting until you secure the desired result. If the mixture is slow in drying, add a little of the common "driers" sold by paint-dealers, Japan for instance, in proportion of one part of the drier to six parts of turpentine. When the floor is a large one, you may vary the tedious work of polishing by strapping a brush to each foot and skating over it.—*Scientific American*.

**BASSWOOD** may be enormously compressed, after which it may be steamed and expanded to its original volume. Advantage has been taken of this principle in the manufacture of certain kinds of moldings. The portions of the wood to be left in relief are first compressed or pushed down by suitable dies below the general level of the board, then the board is planed down to a level surface, and afterward steamed. The compressed portions of the board are expanded by the steam so that they stand out in relief.

**TRADES IN HIGH LIFE.**—The late M. Carnot, father of the President of France, had two sons, both of whom, in view of the great uncertainty of conditions of life in that country, were taught trades, by which, in case of emergency, they might earn a living. The younger brother learned the locksmith's trade; the one now President of the French Republic is a carpenter.

A NEW lubricant, the use of which is advocated in the *Austrian Railroad Journal*, is mustard oil. It remains perfectly fluid at the low temperature of 14° F., and will keep unchanged for years.

**EMBOSSED WALL PAPER**, having all the appearance of carved work, is now being introduced in England. It is not produced by stamps, but by the imposing of flock-designs on surfaces.

**POLISH** bright iron work with rotten-stone and oil, if it is running machinery.

**FILES** were in use among artisans as early as 1093 B. C.

## The Pines of Japan.

Their Quaintness and Significance when Potted and Ancient.

Carter H. Harrison, but so short a time ago Chicago's "best mayor," is in Japan, and is writing a series of highly interesting letters to the *Chicago Mail*. In his last he mentions the pine of Japan. "But when he sees here an old pine tree with gnarled and bent branches, its whole appearance the exact counterpart of the ancient monarch of the mountain-side—when he sees this old-looking, perfectly healthy, and thrifty fir, 100, 200, and some 300 and 400 years old, growing in a flower pot 4 feet long, 2 wide and not 2 feet deep, he hardly knows whether to be most interested in the skill evinced, or amused by the grotesqueness of the idea which suggested the thing. Such a tree I have seen. Its whole height was not over five feet and its gnarled branches did not cover an area of eight feet. I asked its age and was answered 450 years. Near by were dozens of smaller ones in pottery vases, perfect in form—some round and bright as the denizen of rich bottom land, others queer looking, odd old lilliputians that made one think he was visiting an old ancestor of centuries ago, hanging from a rocky crag; that he was looking at it through the reversed lens of a powerful field glass. I ask: 'How old is that?' 'It was planted by my father 52 years ago.' 'And that?' 'My grandfather put it in the pot 70 years ago.' 'And this other here that looks as if it had been watered with the first water of old Noah's tank?' 'Ah, that is a beauty—and the pride of my garden. It was transplanted when no taller than my little finger by my great, great, great grandfather nearly 200 years ago. He spat upon its roots. He is a good god now, and his soul sits among its branches every day and blesses his children.' And the good man folded his hands and looked as if he felt that the spirit of his ancestor, now one of his household gods, heard his pious words.

"These old trees are in gardens and adorn the niches for ornaments in the houses of the well-to-do. They are grown on either side of the central incense burners before the inner temples—the holy of holies—where abide the living souls of the gods in the great temples, both Shintoo and Buddhist. One looks upon them very much as you do when you look into the weak eyes of a baby elephant, so cute, so quaint, so knowing, and so like its monster mother when it stretches forth its flexible trunk to take a peanut from your hand. Then, too, there are monster trees—they claim them to be 1000, or nearly 1000 years old, whose branches have been trained into every conceivable abnormal shape, and are venerated, if not absolutely worshipped.

"We visited one on Lake Biwabi or Biwabo. It is about six feet in diameter just above the spread of the roots, but a little higher up where its three great branches spring out, 13 feet in diameter. At some 20 feet altitude, the many limbs coming out of the three great branches have been trained horizontally, and cover a space of nearly 180 feet from cut to cut. One branch, up to a few years since, lifted to a height of 90 odd feet. A typhoon took it off. The broken place is cemented over and a little house is perched over it. A small temple lies in its shade, and the soul of a god lives and sings among its needles. The attendant first told me it was 1000 years old—I believed him—why should I doubt? Thomas doubted. I never do, especially now that I travel for rest and wish to live in a half dream.

**BEING POSTED.**—Somebody says: If a man truly desires to know how deeply he is posted on any subject, let him write an article upon it. If he goes at the matter considering the world his audience, and writes nothing but what he feels will stand against all criticisms if brought to argument, he will be a much wiser man at the close of his article than when he commenced. I can truly say my writing has done me personally more good in understanding the true principles of our trade than if I had had a hundred lives' work in the manner generally practiced. The good derived from writing is obtained simply from the fact of making one study and originate. Writing upon any subject is the best way to study it.

**CYPRESS WOOD.**—It is demonstrated by actual experiment that cypress is admirably adapted to the building from top to bottom, inside and outside. It is a wood that stays where it is put, makes close joints, finishes handsomely, and works as well in every respect as white pine, though perhaps not quite as easily. For siding, cypress should be selected so that there shall not be rough spots in the grain. A careful throwing out of the rougher pieces will obviate a bad appearance that might be caused by a careless carpenter.

The erection of a quartz mill at Orona, Nev., to work the Trinity mines is now an assured fact. The graders are at work and some of the machinery on the ground. In a short time reduction works will also be built in Cottonwood, and work is being prosecuted on the several prospects at Rye Patch along the mountains to the Silver Bell.

**EMIGRANT GAP** will be a lively camp this summer, as several mills that have been idle for many years will start this season. Friend & Terry will employ a hundred men. George Geisendorfer begins operations about the first of May with quite a large force.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**MINES BONDED.**—*Ledger*, May 5: H. P. Holland and J. W. Stewart of San Francisco have bonded the Crown Point quartz mine, located near Butte City, in Jackson mining district, for the sum of \$25,000, payable on or before March 5, 1897. This property is owned by D. D. Matson, M. S. Matson and J. W. Brown. The same parties have also bonded the Brown mine, located near Butte City, for the sum of \$45,000, payable on or before Jan. 1, 1889. This quartz claim is now owned by M. S. Matson, D. D. Matson, J. W. Brown, Matthew Fleming and L. K. Hall. The persons who have bonded these claims are interested in the New York and other claims, about 2½ miles southwest of Jackson.

**MISCELLANEOUS.**—They have finished crushing the ore on the dump at the Moore mill and are now engaged in cleaning up. About 200 tons were passed through the mill, occupying two weeks. The ore was undoubtedly low grade, being mixed with a great deal of greenstone and refuse matter, but it is thought the yield will be sufficient to leave a fair profit over milling expenses. The shaft of the North Star has reached a depth of 500 feet; no change to speak of in the nature of formation. It is reported that the Amador Queen mine has been bonded with a view to place the stock on the New York market. James Gleason and a gentleman named Callan of San Francisco were in Jackson last week, for the purpose of securing a bond for one year of the Doyle mine in Hunt's gulch. They left Sunday morning after making satisfactory arrangements to bond the property.

#### Butte.

**IMMENSE ELECTRIC PLANT.**—*Oroville Register*, May 3: The electric machinery for the Big Bend Tunnel Co. is now at the depot. It comprises 2 dynamos, 12 motors, 50,000 pounds of copper wire and a large lot of different kinds of machinery. The dynamos have a capacity of 140-horse power, and the motors five-horse power each. There are two lines of copper wire, one of seven miles and the other of ten, and as each is double, this makes about 34 miles of wire. The electric power will be used to run the pumps and derricks. The plant was furnished by the Sprague Electric Railway & Motor Co. of New York. A force of men is now engaged in getting everything ready for this immense plant. Three hundred inches of water with a fall of 300 feet will furnish the necessary power to run the dynamos.

#### Calaveras.

**THE UNION AND RATHGEB MINES.**—*Prospect*, May 2: Last Sunday our reporter visited the Union gold mine and Rathgeb's new mine. There is not a large force of men employed at the Union mine. The shaft is being sunk as rapidly as possible and a few men are kept at work in the upper levels taking out some quartz and looking for pockets. In the afternoon we visited the Rathgeb mine, about one mile south of the Union gold mine. The Rathgeb Bros. have expended considerable money in improvements in and about the mine. Hoisting works have been erected under the supervision of Mr. Buckingham, which for strength and durability cannot be excelled in the county. The main shaft is down about 100 feet and has three compartments and well timbered. The boiler is a very large one and capable of furnishing steam for a 20-stamp mill in addition to running the pumps of the mine and engine. Everything is in readiness with the exception of a few days work in connecting the water and steam pipes with the engine and boiler. The hoisting engine is a double-crank reversible engine and about 40-horse power. Mr. John Rathgeb informed us that he intends to build a mill alongside of the hoisting works during the coming summer. There is already a large quantity of good pay rock on the dump, and by the time they will be prepared to crush the ore several hundred tons more can be piled up.

**WEST END.**—*Angels Echo*, May 2: The West End mine, owned by Smyth & Co., situated about a mile west of Angels, is making an excellent showing. Last Monday a blast in the new shaft disclosed a fine body of ore, which is rich in sulphurets and shows a good quantity of free gold. This mine has a very promising outlook.

**LEONARD.**—*Calaveras Prospect*, May 2: The Leonard quartz mine is improving in appearance every day. A large body of sulphurets was found last week that surpassed anything ever seen in this county heretofore, both in appearance and richness.

**HEX.**—An abundance of water was struck in the Hex mine at Rich gulch on Tuesday, and several men had to quit work. The company have telegraphed for several large pumps, which will be set to work as soon as they can be got in position.

**COPPER.**—About 50 men are employed in the copper mines at Copperopolis, and as soon as some new machinery is put on an additional force of from 100 to 150 hands will be employed. This is encouraging for the little town of Copperopolis.

**ESMERALDA.**—Several new hands have been put to work on the Esmeralda mine and the indications are that the mine will be opened up in good shape ere long.

#### Nevada.

**A SLEEPY CONDITION OF AFFAIRS.**—*Herald*, May 3: There has been a lull in everything hereabouts for several months. Everything seems to be in a rut. Such times often occur among miners. Mining is more or less governed by excitement. If one man strikes it, all become hopeful and all go to work. Mine-owners have confidence in their properties, but are waiting. All it needs to start business up in this section is for some one to go to work. The mines, and the prospects that will make mines, are here. There ought to be 300 more men at work in this district to-day. The mining world is asleep. Business men in town are a little sleepy, too. We suppose a majority of the business men here do not get out of the city limits once in a year. A walking party might be organized with profit. Men become indifferent to the advantages surrounding them. A look on the outside would do such men good. The surroundings all invite enterprise. There is a lull, a suspicious calm all over the county. It may

be spring fever. Go to our neighboring town, Grass Valley, and you have to ring the bell to wake up the proprietors of business houses and hotels. The residents have to come to Nevada City to get their eyes open. Nevada county is not awake. Even the Land Association has nothing to say these days. Mining will start up when people wake up. The gold lies underground waiting for the nimble pick to unearth it. Confidence begets confidence. Talk mines if you can't work mines. Wake up.

**MOORE'S FLAT.**—*Nevada Transcript*, May 6: The mining population are now engaged in profitable drift and quartz mining. At Snow Point, George Coppers, while washing the surface near his ledge, in order to find its direction, cleaned up \$225 as the result of three days' work. This claim is in New York Ravine, two miles distant. Blackwell & Kline at the same place recently took out gravel from their claim that paid \$5 to the car, and are doing well right along. McKillican's gravel mine is working a force of 15 men, and the prospects are favorable for a good paying mine. The old Boston mine is now being opened up under the superintendency of H. H. Brigham. George Abrams, "Happy George," our almost lifelong prospector, has renewed work on the Metropolitan. L. F. Busch, who owns the extension of the Metropolitan, has about ten feet to run before striking the ledge. Thomas Dowling is pushing ahead his drift tunnel in the Illinois to uncover the channel at a point where it is supposed to have narrowed. The Plumbago Extension is looking well, as usual.

**EVENING STAR MINE.**—*Grass Valley Union*, May 5: A first crushing of ore from the Evening Star mine has just been made at Gauthier's mill, the amount being 41½ tons, which gave a yield of \$486.88 retorted gold, or within a fraction of \$12 per ton. This was independent of the sulphurets, of which there were over 1100 pounds. There was some waste in the rock that was crushed, which made the yield somewhat less than it otherwise would have been. The result, however, was quite satisfactory, and as there is plenty of ore of the same quality, in the drift on the level that is being run at the depth of 108 feet, the future crushings are expected to do equally as well, if not better. The vein in the Evening Star is over two feet in width, and the ore shows in free gold and good sulphurets. The company is preparing to put up hoisting and pumping works, when the work of development will go on more rapidly.

**THE NEVADA COUNTY MINE.**—*Herald*, May 4: The owners of the Nevada County are greatly encouraged with the prospects in their drift to-day. Rich rock was found in three stringers which came in this morning, and lead to the belief that they will, in a short distance, unite and make a solid ledge. It is believed the point where this rock is found is near what is known as the Italian Shoot, which was worked 20 odd years ago, and from which rock was worked that milled \$150 per ton. The owners of the Nevada County are persistent and deserve to strike it rich. A few more men like them in the community would help to open up some of the many good prospects hereabouts. The owners of the Nevada County mine are several degrees removed from the millionaire level, but they spend their coin liberally, and will, we hope, get returns, eventually, that will amply repay them.

**SATISFACTORY CRUSHING.**—*Tidings*, May 3: The first crushing of ore from the Evening Star mine, situated on Squirrel creek, has been completed at Gauthier's mill. Forty-one and a half tons were reduced, yielding at the rate of \$18 a ton. This rock was taken from a ledge averaging 3½ feet in thickness and from a depth of about 100 feet. Not a little waste dirt was mixed with this ore. This showing is regarded as satisfactory and as warranting further developments, to prosecute which to any extent a hoisting and pumping plant must be erected. The Evening Star is managed by W. B. McSherry and is owned by San Franciscans. It adjoins the Pittsburg, recently relocated by C. E. Clinch and others, and which is to be operated.

**THE EARTHQUAKE FLOODS A MINE.**—*Grass Valley Tidings*, May 2: Up to the hour of the earthquake of Saturday night, the water in the Orleans mine at Prescott Hill was easily kept "in fork" with the pump running slowly. Saturday night the pump was run as usual, but when the men went down the shaft Sunday morning, it was found that the water had risen the lower level. Since then the pump has been kept going at full speed, and yet the water has not been reduced. The supposition—and no doubt a correct one—is that the earthquake opened a seam in the earth from the shaft to a subterranean reservoir.

**MINING AT MONTEZUMA HILL.**—*Nevada City Herald*, May 3: Irvin Hiseock, Stephen Murphy, Fremont Woods and Joseph Keifer have opened a good drift gravel mine at Montezuma Hill, this county, called the Murphy mine. The mine is easily worked and pays well, although the owners have not yet reached the bedrock. They are about starting a new tunnel which will give them 10 feet more back. There are other claims on the same lead, near by, which are supposed to be equally as good.

**LONE JACK MINE.**—*Grass Valley Union*, May 6: George Mainbart is just now about the busiest man in town. Mr. Mainbart is the superintendent of the mining business inaugurated by San Francisco, Sacramento and Eastern people, for the purpose of developing the Lone Jack mine and several claims adjoining. The new shaft on the Lone Jack is now down 100 feet, the shaft being timbered to its fullest depth. Every encouragement is given by appearances for a paying mine.

#### Placer.

**FOREST HILL DIVIDE.**—*Placer Herald*, May 5: The town feels and shows the effects of the mining operations that are conducted in its vicinity. The most important mine is the Mayflower, which has given employment to a large number of men for several years. The gravel is very rich, but owing to the great expense of hoisting it, the company concluded to run a tunnel. The necessary survey was made, and the tunnel was begun in the fall of 1886, and during the following 18 months it was run 5200 feet; and during the last eight months of this period 2800 feet were excavated. This is a great work, considering the difficulties under which it was done, and cost \$104,000. Such was the accuracy of the survey and the skill of the workmen that when the connection was made there was not the least deviation. One can stand at the farther extremity and see the entrance. The tunnel for the last 500 feet

is 10 feet wide and seven feet high. About 60 inches of clear water are constantly flowing from the tunnel. The works of the company are extensive and costly, and embrace the most improved machinery. There are two compressors for working the Burleigh drills, the hand drills and the bellows of the forges. These compressors are run by steam and by water-power. The new mill is about half completed, and is located below the tunnel's mouth. At the time of writing work is suspended, owing to the sale of the mine. The company have received a forfeit of \$20,000, and expect to receive the remainder, \$520,000, in 60 days. The Baker Divide tunnel is about 4000 feet in length and crosses the ridge. The company expect to intersect the Mayflower channel. Ten men are at work in the tunnel and several more are employed on the surface. A large force of men is at work at the Dardanelles, building a mill, cleaning ditch and getting out timbers. The mill will be ready to crush in two weeks. The gravel is quite hard, but is very rich—paying \$11 per carload. At the Gray Eagle mine work is progressing as fast as circumstances will allow. At present, work in the shaft is at a standstill, as a third boiler is being put in place. This is necessary, as a large quantity of water has been tapped. The indications are better than they were a week ago. At Yankee Jim's only a few men are operating. Charles Trafton is running a tunnel into Georgia Hill and expects to strike a rich lead and a deep channel. O. W. Henderson is working the old Davis claim; he has not made a cleanup as yet. Harry Adams is cleaning out his tailings claim in Brushy canyon. The Gilberts and J. Welker are opening drift mines on the north side of Georgia Hill. Breece & Wheeler are working 27 men on the Paragon ground. Their tunnel is in 7000 feet, and is running through uneven rock. The gravel is of good depth and very rich—averaging \$10 to the carload. They now run out gravel enough to keep the mill constantly crushing. The head of the tunnel, is now under Mayflower ravine. Operations at the Live Oak mine are going on night and day. Quite a large force of men is engaged at the mill and in the tunnel which is now in a reddish gravel that will pay well. The gravel is taken out near the front of the claim. Just now they are not running the tunnel ahead, but are breasting across the channel, which is 300 feet wide. The mill is a substantial structure and is run by water from the Mayflower tunnel. The Big Gun mine is the only claim near Michigan Bluff that is being worked at present. This old mine continues to pay about the same as it has for the last 20 years. T. Muir has a few men at work at the Weske and Oro claims. The Hidden Treasure keeps up its record in paying big dividends. The tunnel has been put in complete working order. One hundred carloads, or 400 tons of gravel, are taken out daily. The cars are drawn out and in by horse-power. The company employs 140 men. Tillotson & Co. have very good indications in the Golden Rifle, above Canada Hill. They believe they have struck the main channel. Some 25 men are at work on the Hogsback. The Red Point mine is yielding \$1.80 per carload. On the river, Boston Bar is paying well. Very little work is going on at the Horseshoe tunnel on account of a broken shaft. The tunnel clears itself—even logs and trees are carried through. Everything points to a lively season this summer all over the divide. Prospecting is going on in all directions. This work is being done principally by companies with ample means, and it is safe to infer that work will be continued until the secret treasures of this section are discovered.

**STRIKE.**—*Placer Republican*, May 2: After three years of hard labor on their gravel claim in Green Valley, Henry Keller and Chris. Helenkamp have at last made a good strike, and last week were taking out gold at the rate of \$25 a day.

#### San Benito.

**A VALUABLE PROPERTY.**—*Advance*, May 4: Few of our people are familiar with a mining industry being carried on close at home. The mines of the Gypsy Mining Co. are situated about 15 miles east of Hollister, and are owned by the Woody Bros. and Griffith & Dalzell. For the past two years an average of \$600 worth of quicksilver has been produced and shipped every month. Up to the present time but one small retort has been worked. L. R. Young has just completed the erection of a second and larger retort, which will greatly increase the production of the precious metal. Ten men are now employed, and more are wanted. The ore body is apparently inexhaustible, and ore taken from the surface is very rich in mercury. With the new appliances, the owners of the mine expect to take out \$10,000 worth of metal from the present time to the first of next January. The mines are splendidly situated for fuel, as they are surrounded by timber. Some of the specimens of ore taken from the tunnels show 60 per cent of metal. The mines are being rapidly developed, and will soon be a source of great wealth to the owners.

#### Shasta.

**A RICH CAMP.**—*Shasta Co. Democrat*, May 3: The *Democrat* has been a special champion of mining interests of old Shasta, firmly believing in the permanency and value of her mines, and it is more than a pleasant task to notice the development of mining property that from the beginning of developments shows permanency and value. The new mining camp on Cline gulch, in French gulch district, merits special notice in these columns. The first discovery was made by Mr. Frank Wheeler, last August. Inside of three months his claim developed sufficiently to warrant him in erecting a five-stamp milling plant, and from the first turn of the machinery the mine has paid handsome dividends, averaging over \$8000 a month net. His discovery led to others, on the same belt, and about a month following, J. N. Vannoy located adjoining the Wheeler on the east, and a week or so later Tom Cummings, Chas. Osborne and John Morrell located three claims adjoining Vannoy, still farther east, known as the Helena, Gladstone and Giant. This belt is a distinct continuation of the famous Deadwood mines eastward as far as Squaw creek, a fact positively proven by discoveries old and new. All these claims on Cline gulch show well-defined contact between slate and porphyry, and have every indication of permanency; in fact, they are a counterpart of the McDonald and Black Bear mines of Deadwood. The Helena is opened up by an open cut along the ledge, exposing ore that will mill \$60 a ton. On the Gladstone is a crosscut tunnel 60 feet, and a winze down 30 feet, from which has been extracted 200 tons of ore that will mill \$25 a ton, and

another tunnel just started that will tap the vein about 200 feet deep. An open cut has been started on the Giant, which exposes a vein seven feet wide, the ore showing much free gold. On these claims is a fine water privilege and plenty of mining timbers. As far as developments show this vein averages four feet in width the entire length of these three claims. We don't believe there is a new camp on the coast that can show, according to stages of development, better prospects for permanency and value.

**NOTES.**—*Shasta Co. Democrat*, May 3: Tom Green last week struck a new, large and rich chute of ore in his mine. The Calumet Mining Co. is patenting its mines in Old Diggings. We are told that Colorado capitalists are negotiating for the purchase of the Black Bear mine on Squaw creek. Experts have just spent a week examining the Windy camp group of mines and gone below to report, so we are informed. Flanagan, Forbes & Co. are reopening the old Florida on Star gulch, Old Diggings district, and are preparing to crush ore in a cannon-ball mill. White & Parsons, Arizona men, have bonded the Quartz Hill mine, and intend to run tunnels and crosscuts through that immense body of quartz. The Wheeler mine, on Cline gulch, is yielding handsome monthly dividends. Two claims adjoining this mine on the east are prospecting big, and present developments warrant the belief that they are valuable prospects. Bill Murray, John Finley, Dave Forbes and Col. A. C. Ellis have "struck it rich" on Clear creek, nearly opposite the Squaw creek mines. In the past month the boys have taken out over \$3000. They are sinking on a vein of yellow ochre ore, and take out from \$50 to \$250 a day. They mill their ore in a large mortar. F. H. Deakin is sinking a well on his premises at Lina Vista, and is down 130 feet in blue gravel, which prospects from 10 to 50 cents to the pan.

#### Sierra.

**THE ALASKA MINE.**—*North San Juan Times*, May 5: News comes from Pike City to the effect that Mr. Judson, assistant superintendent and book-keeper at the mine, left Pike City Friday of last week and went to the Bay City, via Marysville. It is generally believed that the mine will be abandoned to its creditors. For nearly a month past there has been no labor employed at the mine, except merely sufficient to run the pumps. The creditors are loath to take the plant, because of their inability to work it. It is said the indebtedness of the Alaska Co. is something over \$100,000, from \$50,000 to \$60,000 of which is due and owing to the toilers or delvers. There are filed in the recorder's office \$50,000 worth of liens against the property of the company. Colonel Bates, the superintendent, has not been to the mine for about two months past. He is in San Francisco. It is generally believed that the mine has gone up "where the woodbine twineeth," and unless the creditors take it, it will be allowed to fill up with water.

**NEW PROSPECT.**—*Sierra County Tribune*, May 5: Last week Martin Carroll while strolling over the hill just back of Devine's ranch, stumbled on to a quartz ledge that, judging from the prospects, will turn out to be a regular bonanza. He has two men sinking upon it and as depth is gained it continues promising. It is called the Pacific.

**CLEANUP.**—*Mountain Messenger*, May 5: The Young America mine cleanup for the month of April was about \$12,500. Owing to the scarcity of water, the mill did not run all the month.

**DIVIDEND.**—*The Gold Canyon Quartz Mining Co.*, operating below Minnesota, in this county, declared a dividend of five cents a share on a capital stock of 200,000 shares.

#### Tuolumne.

**MILL.**—*Union Democrat*, May 5: It is reported that Dick Ritchie's mill at Tuttleton is doing good work, and that the mine is turning out well. The Green mine, four miles northeast of Confidence, has a force of 15 men at work, and the mill will be started now in a short time. Under the supervision of Supt. Sharwood of the Black Oak mine, a big force of men is at work putting up new hoisting works and laying the long stretch of pipe for water-power, which when completed will be the best in the county. W. N. Harris, Esq., from Jamestown, was in town this week, and reports that the Little Gem mill on account of some decaying timbers broken down. Repairs are going on and Mr. Harris expects soon to have the mill in operation. The gentleman also reports that a few hands are employed at the Alabama mine, getting out rock, and doing exploration work.

**A DITCH.**—*Tuolumne Independent*, May 5: Mr. Harriman informs us that arrangements have been made between the Tuolumne Water Co. and Alvinza Hayward & Co., to build a ditch from Middle Camp to the Dead Horse mine, at Simmerville, a distance of seven miles; the water to be used to run the mill and other machinery of the mine. The work of building the ditch will be let in sections, and must be finished by the first of June. This will give work to all those who are at present seeking employment. Not only will this enterprise help the mine, but all living on the line of the ditch will hail its coming with delight.

#### NEVADA.

#### Washoe District.

**YELLOW JACKET.**—*Enterprise*, May 5: Are putting in two new boilers at the hoisting works, and the work is fast approaching completion. Are shipping 90 tons of white rock (gold bearing) to the Santiago mill daily.

**SAVAGE.**—Since last report the south drift on the 400 level has been advanced 22 feet, and continues in good ore. The southeast crosscut from this drift is extended 110 feet, 20 feet having been added to it during the week. The west crosscut from the face of the north drift from this level has been advanced 40 feet. The face is in fair-grade ore. On the 500 level the west drift from the new station has been advanced 22 feet, and the south drift to connect with it from the top of the 600 level upraise was extended 17 feet. Are extracting about 100 tons of ore daily of good quality from between the 400 and 500 stations, and are shipping to the Rock Point mill 70 tons. Have bullion on hand and previously shipped this month amounting to \$42,000.

**CROWN POINT.**—In consequence of an error in the survey, they have been compelled to drift 25 feet west from the top of the 500 upraise to connect with the bottom of the 400 level winze. The connection

has been made. The 600 level south drift has not been advanced. The east crosscut on the same level was advanced 22 feet during the week. Struck a clay wall the first two feet run, pitching at an angle of 75 degrees west, and the last 20 feet have been in quartz. Of this quartz the first 10 feet is good ore, carrying a large percentage of gold. The next 10 feet was of considerably lower grade; the next foot was a mixture of clay, porphyry and quartz, and last Tuesday good ore appeared in the face again, carrying a large percentage of gold and silver. No work has ever been done, either on the levels above or below, to show whether this ore goes up or down, and in the opinion of the superintendent it is impossible to tell whether it does or not.

**OCCIDENTAL.**—In the lower tunnel, 75 feet south of north incline winze, the incline upraise has been carried up four feet; total, 49 feet, and 150 feet south of the north incline winze the south drift has been extended four feet; total, 80. From this drift, at a point 35 feet south from the main tunnel, east crosscut No. 1 has been extended three feet; total, 11 feet. Eight tons of ore have been extracted.

**HALE AND NORCROSS.**—Are extracting from the 600 and 700 levels the usual amount of good ore. During the week have hoisted 1543 tons of ore, and have shipped to the Nevada and Mexican mills 1450 tons. The stopes throughout the mine are looking well. Have bullion on hand and previously shipped for this month amounting to \$138,000.

**BEST AND BELCHER.**—The west crosscut from the top of No. 2 upraise has been extended 27 feet; total, 47 feet. The formation is porphyry and quartz. From the bottom of the winze, 50 feet south of upraise No. 2, an east crosscut has been advanced 25 feet, passing through quartz showing some value.

**SEGREGATED BELCHER.**—The south drift from the 1300 level raise was advanced 12 feet during the week. The ground shows no change. Repairs in the 1300 level drift are progressing rapidly, 200 feet having been completed during the week.

**SCORPION.**—The south drift from the 300 level has been advanced 20 feet during the week, and its total distance is 233 feet. There is no change in the character of the ground worth reporting.

**UTAH.**—On the 372 level, at a point in the west crosscut 75 feet from the upraise, the south drift has been advanced 45 feet, passing through porphyry and quartz and a formation of nominal value.

**GOULD AND CURRY.**—During the week have extracted from the 250 and 300 levels and shipped to the Douglass mill 255 tons of ore, the average battery assay of which is \$29.14 per ton.

**KEYES.**—The east crosscut is in very favorable soft porphyry. North drift running parallel and near the hanging-wall is showing some rich ore, assays running from \$200 to \$400.

**BALTIMORE.**—Have got the new pumps working and are rapidly lowering the water preparatory to resuming work in the north and southwest drifts on the 350 level.

**ANDES.**—Are drifting east on the 350 level. The face is in quartz. Are still drifting north on the 240 level in low-grade ore with occasional spots of rich stuff.

**BELCHER.**—The 1300 level raise has been advanced 30 feet in quartz giving fair assays. Repairs to the 1300 level drift are progressing satisfactorily.

**BULLION.**—Are drifting east and west on the 640 level at the bottom of the winze. Have got about 70 feet east and started to crosscut west.

**CONFIDENCE.**—Are shipping at present daily to the Brunswick mill 200 tons of ore, the battery samples of which show a value of \$37.60.

**WEST CON. CAL. VA.**—Are sinking shaft and making good headway. Preparations for erecting steam-hoisting plant are in progress.

**IOWA.**—The south drift from the McBee tunnel has been advanced 21 feet; total, 78. The face of the drift is in ore showing fair assays.

**ALPHA.**—The north lateral drift on the 382 level is in 210 feet, and the winze 100 feet from the Alpha shaft on the 382 level is down 79 feet.

**CHALLENGE.**—The joint Jacket-Challenge west drift on the 1000 level is in 49 feet, having been advanced 23 feet during the week.

**CHOLLAR.**—North drift No. 2, on the 450 level, is in 515 feet in low-grade quartz.

**POTOSI.**—The southwest drift on the 450 level is in 350 feet in clay and porphyry.

**OVERMAN.**—Shipping 40 tons of ore daily to the Vivian mill. It is of fair grade.

**ALTA.**—Mill running steadily on ore from the 1150 and 825 levels.

**BENTON.**—The usual work is progressing on the 725 level.

#### Tuscarora District.

**DEL MONTE.**—*Times-Review*, May 5: Fair progress has been made in cleaning out and fitting up the tunnel.

**PONDRE.**—Main drift advanced 4 feet; rock hard, containing stringers of good ore. Face of drift shows an improvement as we advance. The end of crosscut from north drift is showing a five-foot ledge between well-defined walls, which improves as we advance. A crosscut has been started to cut a ledge 60 feet east, which prospects well on the surface. Have suspended No. 2 for the present, as we can cut the ledge from the main works at a greater depth and at less expense.

**NEVADA QUEEN.**—250-foot level: South drift from the station has been extended 14 feet in very hard rock. 350-foot level: The east crosscut from north drift has been stopped, and started a crosscut west in the vein, which has been driven 18 feet. The upraise has been extended up 11 feet; total from 196 feet; there has been quite an improvement during the past week, the ore being higher grade; assays average \$237 per ton.

**COMMONWEALTH.**—150-foot level: South drift from station has been extended 19 feet; at 160 feet cut into very fine ore 16 inches; cannot tell how wide the ore is, it still showing good ore; average assay, \$222.77 per ton. The drift started on the ore found 70 feet from the station has been driven 13 feet, showing good ore all the way; average assay, \$197 per ton.

**NAVAJO QUEEN.**—North drift from the west crosscut advanced 17 feet during the week. Bunches and streaks of good-grade ore are being met with.

**NORTH BELLE ISLE.**—Intermediate level stopes

are looking very well, as are also the stopes from 100-foot level of the Nevada Queen. The usual amount of ore has been sent to the mill and dumps during the week.

**GRAND PRIZE.**—Have started drifts east and west from south crosscut on the hanging-wall vein. The west drift is advanced 5 feet in a good width of high-grade ore. The east drift advanced 19 feet in stringers of ore.

**NAVAJO.**—Fair progress has been made with the work on the west vein south drift, 150-foot level. Stopes on the 350-foot level have produced the usual amount of ore.

**FOUND TREASURE.**—Southeast drift has been extended 12 feet. Upraise No. 3 has been carried up 14 feet; total, 38 feet; the face still showing good ore.

**NORTH COMMONWEALTH.**—The vein in the new shaft has been followed down and connected with the Found Treasure upraise.

**BELLE ISLE.**—Stopes have produced their usual amount of ore.

#### ARIZONA.

**ORE SHIPMENTS.**—Prescott *Courier*, May 1: Mines of Slate creek, Hassayampa district, are producing considerable ore. Dan Hatz has returned from 7½ tons of second-class ore. The shipment paid at the rate of \$45 per ton. He is now shipping between 16 and 18 tons of first-rate ore, and expects it to yield \$80 or \$90 per ton. W. W. Davis has sent four tons. All of this ore has gone and will go to the Argo works, Denver, Colo. W. A. Rowe has big dumps of ore. Smith & Bigelow are shipping. McDonald continues to send in rich Blue Dick ore. It is said in Prescott that P. A. Craigue has struck a large body of rich ore in the Buzzard mine. The *Courier* hopes that the rumor is true. Talk is that Mr. Leavick will very soon employ 24 additional miners in the Storm Cloud mine. Harland & Barrington are crushing rich gold ore from the Howard mine. Standard mill, on Groom creek, will be started on another run Tuesday or Wednesday next. There is great activity in Copper Basin, sinking shafts in the great copper mines. Col. Bean and others have looked out and located a route for a road, which will soon be built. Large shipments of ore are being made by miners of Walker and Big Bug districts. Mr. Rudy informs us that placer miners continue to make good wages by washing gold out of Skull valley gravel. Mining, mill and road building are being prosecuted in Martinez, Weaver and Bradshaw districts.

#### COLORADO.

**SAN JUAN.**—Silverton *Miner*, May 2: The Sunnyside mine is looking better than at any time since its location. The samplers will soon put on another shift and work day and night to handle the output. Trails to all of the mines are being opened and every pack animal in the county is busy. The Silver Bell at Ophir has increased its force and output at a rate of three tons per day. Wyman & Co. have the contract to pick the Bear output to Silverton. Five hundred tons are already out. The Silver Lake is getting ready to ship as soon as the trail is opened. Hundreds of tons are already to be packed to Stoiber's sampler. The Montezuma, at Ophir, has been doing deadwork all winter but will shortly increase its force and swell the output during the shipping season. Ten tons per day are coming in regularly from the North Star (Solomon). News was brought to town last Sunday of the richest strike ever made of wire and brittle silver in this county. Mr. Chas. Graf on making his usual visit to the mine last Sunday, learned that the night shift in the main tunnel had suddenly come upon an ore body the extent and richness of which has since been the subject of the wildest conjecture. In the breast of the tunnel, 350 feet below the surface and 800 feet from the mouth, now shows a streak of ore eight inches thick and nearly a solid mass of brittle silver. Wire silver curls in the pockets and cavities of the rock like miniature bunches of horse hair, and the specimens brought to town are the handsomest we have ever seen. The importance of this strike cannot be estimated. Its depth proves the permanence of our true fissure veins, and shows again that our mineral grows richer with depth. The Lackawanna tunnel is heading directly for the center of the group, which embraces over 70 acres of mineral claims.

#### DAKOTA.

**LEACHING WORKS.**—Deadwood *Pioneer*, May 2: Prof. Clark, accompanied by Mr. Franklin, of the Deadwood Reduction Co., yesterday paid a visit of inspection to the various sites below the city, hitherto discussed for the erection of leaching works. The site has not yet been definitely determined, but will be decided on at a meeting of directors to be held toward the close of the week. Mr. Clark goes to Rapid this morning to aid in Professor Carpenter's proposed test at the school of mines, in applying the leaching process to Bald mountain ores. On the Silver Queen, always a favorite Galena location, recent very encouraging discoveries have been made. A new tunnel was started, in which a large body of good galena ore has already been struck. Owners feel jubilant and are rapidly pushing explorations.

**CINNABAR.**—The reporter was yesterday shown a very pretty specimen of cinnabar, from the White Ridge claim, south of Elk mountain. The location is the property of Jno. F. Barry and others who intend considerable developments this summer.

#### IDAHO.

**GALENA BELT.**—Coeur d'Alene *Record*, April 25: Since the sale of the Fuller, Green Mountain and Burke claims and the organization of the Poorman Extension Co., the order for lumber for the Poorman concentrator has been increased from 150,000 feet to 400,000 feet. The concentrator will begin its work with a daily capacity of 150 tons instead of 50 or 60 tons as was first intended. The shipments of concentrates and first-class ore from this great mine alone will then be about 40 tons per day. The product of the Tiger is now 25 to 30 tons. Suppose the Tiger and Poorman Companies handle 25 tons of ore per day, obtaining at least 65 tons of concentrates, worth in the neighborhood of \$40 per ton. A little figuring shows us that such a product would represent a value of \$2600 per day, \$78,000 every 30 days and about \$800,000 per year. Other properties in

that district will be producing to such an extent as to warrant the very conservative assertion that Canyon creek mines alone will soon be adding to the enormous mineral product of Coeur d'Alene at the rate of at least \$1,000,000 annually. Now it is not likely to be more than a few months at furthest before shipments will begin from a number of valuable properties in three other galena districts, viz., Evolution, Placer Center and Hunter, which include within their limits such claims as the Polaris, Argentine, Black Bear, Granite, California, Hunter, Morning, Evening, Central and many others, which, with development, may take rank among the greatest producers. The present outlook is so bright that no one well acquainted with the wonderful resources of Coeur d'Alene will consider it extravagant to estimate the probable silver-lead production before the close of 1889 at 6500 tons of concentrates per month, or at the rate of 75,000 tons per year, representing a cash value at the mines of \$3,000,000. Miners and mine-owners will soon be able to profit by an advantage that has not hitherto been afforded them. Mr. Frederick Burbridge, the present gentlemanly agent of the Holden Smelting works of Denver, is about to establish sampling works at Coeur d'Alene City. The erection of the building has already commenced and he expects to have the works in operation within two weeks.

**A WONDERFUL MINERAL BELT.**—Wardner *News*, May 1: Evolution district is rapidly coming to the front as a mining center and at present presents a map of busy life. A number of very promising locations are being worked in that vicinity, while a confidence pervades those interested that is truly encouraging. The West Point group, containing the Nellie, West Point, Sierra Nevada and Rosebud, are owned by Horton and Alger. The Nellie mine is opened by three tunnels aggregating 350 feet; there are now about 30 tons of ore on the dump which the owners propose shipping to the sampling works at Coeur d'Alene City at an early day. There is ore in all the tunnels, each tunnel being on a different chute on the same vein, and the different chutes are of various grades, ranging from 50 to 1000 ounces silver, dry ore. The owners are working hard to develop the property into a paying proposition and will continue operations steadily through the summer. The ledge on each of the other locations of this group is well defined, showing a grade of ore varying from 17 to 150 ounces, also dry ore, this being merely on the surface. The worthy owners are much elated at the prospect of the whole group, and Captain Horton speaks with a degree of confidence truly inspiring, feeling convinced that himself and partner will shortly be enabled to see other men hard of muscle and strong in the back, doing a lot of the hard work. The Mineral Point lode at Osborn, owned by Bill Osborn and others, is looking finely. The ledge has been struck several hundred feet below the old workings and displays a body of fine gray copper ore. On the same belt is located the Yankee Boy, on Big creek, owned by the Blake boys, who have a remarkably fine showing, and are taking out at present very rich ore. The Polaris is of equal importance, and will, before the summer is over, be reckoned among the most valuable properties in the country. Between the famous Argentine and the Mineral Point there are a number of good locations carrying the same ore for a distance approaching 8 miles.

**BUCKSKIN.**—Ketchum *Keystone*, May 3: It is reported that the St. Louis Co., working the Buckskin mine near Stanley Basin, have cut their vein with a tunnel at considerable depth from the surface. The ore at the point of intersection of the tunnel with the vein seems to be of a low-grade in character. Although the vein may be strong and well defined, yet it frequently occurs in running long crosscut tunnels to tap a vein, that when an intersection is made, it will be found some distance from the ore chute exposed near the surface. In the case of the Buckskin tunnel, the ore chute will no doubt be found by drifting on the tunnel level, but how far the company will be obliged to drift, and how soon the contact can reasonably be made are questions of doubt and great uncertainty. The Buckskin mine has the reputation of being a meritorious property, and the fact of not encountering good ore by means of the tunnel is no detriment whatever to the value of the mine.

**LAD OFF.**—Nearly all the force of miners employed at the Parker group of mines have been laid off. This movement on the part of the managers is said to be only temporary, and when work is resumed again, it will be more vigorously prosecuted than before. It is reported that very fine progress has been made of late in the course of development of this fine mining property. Mr. Clemens came in yesterday from the Carolina mine in Greenhorn gulch. He brought in some very handsome specimens of galena and sand carbonates. The galena assays 180 ounces silver and 70 per cent lead. The ore chute on the Carolina is reported to be 100 feet in length. News was received yesterday that a fine strike of rich ore had been made in the True Friend mine, situated on the Elkhorn belt, a few miles from town. The ledge is reported to be three feet wide. The samples of ore brought in are certainly very fine. All the reports of the steady and flattering developments being made at the different mines at East Fork are daily being verified. When the noted North Star mine resumes operations again, the miners of that meritorious locality may confidently expect a considerable boom.

#### MONTANA.

**BASIN'S BOOM.**—*Inter-Mountain*, May 3: The old and for a long time dilapidated burg of Basin has awoke from its Rip Van Winkle snooze of many years, and is now building and improving rapidly. Several of the best prospects are not doing anything just now, waiting for the other road, and part of them are in litigation, that curse of all mining camps. The Buster mine, owned by Kleinschmidt & Co. of Helena, is being operated by Maxwell, Doyle & Co., under a lease. They have a nice body of ore and have just started up the arastra above town. They expect to be able to reduce about two or three tons per day in this way and save up to a fair percentage of its value. They feel confident of averaging \$25 a ton.

**A NEW ENTERPRISE.**—A company of Eastern capitalists from Philadelphia have secured title to a quantity of the placer ground some nine miles up Basin creek, and are spending a large sum of money developing it. They are incorporated under the name of the Penn Placer Mining Co. Last season

they put in a sawmill and ditched, and flumed the water from Basin canyon down to their location. It is high enough to give them about 150 feet of pressure for hydraulic purposes. They then went to the lower end of the flats and built a large flume to carry all the water in the creek, dammed the bank, turned it into this large flume, and run it off over a bar. They are now operating in the bed of the creek, preparing to put in a four-foot bedrock flume. The enterprise is a worthy one and has the appearance of being a profitable one in the near future. The prime mover of the enterprise is Rev. Wm. B. Reed, who at one time filled a pulpit in Helena. The work at the present stage is being superintended by Mr. Walsh. They are working about 30 men and increasing their numbers as fast as they can make room for them. This flat that they are expending so large an amount of money to open is some three miles below the old placer diggings that have been profitably worked for the last 18 years, and two or three companies are still operating them.

**GRANITE.**—*Inter-Mountain*, May 1: "I was a little surprised to see Granite drop \$3 a share, last week," said a leading mining man. "Of course everybody may not know the significance of cutting the dividends down one-half for the next four months, and of course manipulators on the stock exchange will do all they can to keep small holders in ignorance and to create a panic. The real fact of it is, as everybody here knows, that the reduction of dividends for a short time is for the excellent purpose of doubling the old figures for keeps as soon as the new mill is up, thus paying \$1 per share each month."

**COMBINATION.**—The mill at the Combination Co.'s mines will be started as soon as the Free vanners, which are now being put in, are ready for work. This will be in a very few days. Twenty-five hundred shares of the stock were sold Saturday at 50 cents, which is 150 per cent advance since the new organization was effected. The stockholders of the combination will be glad to learn that the litigation in which the company has been involved for some time past has at last been settled finally, and on a basis that was very favorable to the company.

**THE HOPE.**—"What's new at the Hope?" was asked of Mr. Adams, superintendent of that steady old producer, while he was in town yesterday. "Nothing much," was the reply, "only that we've got plenty of good ore, but that is not anything particularly new, for we've never been out of ore."

**THE SAN FRANCISCO.**—"How about the reported strike in the San Francisco?" Mr. Adams was asked. "I don't know anything about it further than this, that it is the current report in Phillipsburg that the San Francisco opened up a fine body of rich ore last week, and I guess there is no doubt of it being correct."

**AMY-SILVERSMITH.**—Work on the Amy-Silver Smith has been resumed, though on a somewhat small scale, only five or six men having been put on. The force it is understood will soon be increased.

#### OREGON.

**SPARTA.**—Bedrock *Democrat*, May 1: The mines are booming. Owing to a scarcity of free water, placer mining thus far has not been as extensive as usual, but when the Sparta canal is ready to deliver water, the work will commence in earnest, and the recent new discoveries will furnish employment for many men. Del Monte tunnel No. 2, cut the ledge at 215 feet, and work has been pushed day and night, and several hundred tons of good pay-ore is now on the dump. The vein is full 8 feet wide and the output of ore is 30 tons daily. The tunnel is first-class work, and is now under cover 279 feet. Tunnel No. 2, on the Gold Ridge, cut the vein at 75 feet, where a drift has been run on the vein (which is full 4 feet) 29 feet. Tunnel No. 2, on the 125 level below No. 1, is within 6 feet of vein cut in upper tunnel and will be continued until the ledge is reached. Notwithstanding very little is said or known of us on the outside, more permanent development has been done the past 6 months in this camp than any other in Eastern Oregon, and we have the ore on the dumps to show what we have been doing. The Sullivan group, lately examined by the well-known mining expert, S. S. Burt of Chicago, and on which property 3,464,000 tons of ore averaging \$15 in gold to the ton was reported, will soon pass into the hands of an Eastern syndicate and work on an extensive scale will commence early in May.

#### UTAH.

**OPHIR.**—Salt Lake *Tribune*, May 2: Isaac Roland of Ophir sends word that after having struck a big body of ore in his mine the other day, he had the misfortune to fall from the apex of the lode and bruise himself up considerably.

**TINTIC.**—Tintic is sending out from 10 to 13 carloads of ore per day. On Monday the Salt Lake & Western brought out 11 carloads of silver ore and two cars of iron ore. The mines are looking unusually well and are being worked to a greater extent than in the past. Mr. Chisholm, manager of the Centennial, Eureka, Tintic, received two carloads of rich silver ore in the past three days. This mine may now be classed as a regular ore-producer. The Bullion-Beck & California Co.'s property at Eureka, under the able management of W. H. Smith and Captain H. H. Day, is producing well, and what is better, the mine looks as if it was going to produce for an indefinite length of time. The property never before looked so well. New ground is being continuously opened up, so that there is immense stopping ground ready for extracting the ore.

**DEEP CREEK.**—J. F. Woodman, who is operating in the Deep creek country, is expected in this city in a few days. He and other mining men out there have become tired waiting for the Salt Lake & Los Angeles railway, so they propose to test the practicability of hauling high-grade ores to this city for reduction. For this purpose Mr. Woodman is bringing in five tons of ore, and if it is found to pay such long hauls, teams will be put on this road to bring in large quantities of ore.

**COAL.**—S. H. Gilson came in yesterday from the coal mines near Sunnyside. He reports several tunnels having been run in, one over 100 feet long, and the face in which the coal lies is 16 feet thick. He says this coal is all in point of quality and quantity that they have claimed for it, and predicts that the mine will soon become a large producer.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a snitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

TATUM & BOWEN,

# PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

 18,280.—DESIGN SIDEWALK DEAD-LIGHT FRAME—P. H. Jackson, S. F.
- NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co. in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DESIGN FOR SIDEWALK DEADLIGHT FRAME.—P. H. Jackson, S. F. No. 18,280. Dated May 1, 1888. The invention consists of a novel design for an iron frame. The design consists in the peculiar configuration of upwardly projecting points. The leading feature of the design is the triangular-shaped projections or spurs arranged equi-distant from each other around each of the openings, so that while a part of the points are common to each of the adjacent openings the set of points around any one of the openings will form the appearance of a star.

PIPE-RIVETING MACHINE.—Geo. Cumming, assignor of one-half to Francis Smith, S. F. No. 382,142. Dated May 1, 1888. By this mechanism pipe sections may be very rapidly riveted up with the least amount of handling, and by means of the movable or traveling hydraulic cylinder, with its plunger and the automatic mechanism for advancing it, the work is rapidly completed.

## Mining Share Market.

The condition of the mining stock market does not now so singularly affect the mining industry proper as was formerly the case. The Virginia Enterprise says: The stock market has entirely divorced itself from the condition of the mines on the lode and started business on its own hook. The big holders are allowing it to drift without sail or rudder, and the small chippers and bears are eking out a miserable existence by bearing their united weight on the market all they can. There will be no revival until the big bulls get on one rope and pull together to steer the market where the condition of the mines says it should be, and that is much higher than now.

Confidence steps forward and takes her place among the dividend-payers of the Comstock by giving to each and every holder for each and every share \$2, amounting to nearly \$50,000. This, with Norcross's \$50,000 dividend and \$108,000 from Con. Cal. Va., makes a total sum paid in dividends of \$214,000. The amount paid for wages on the Comstock last month was \$231,000, making a distribution in these two items of \$445,000. It is safe to estimate the other expenses of the mines at an equal figure with the amount paid for wages, bringing the grand total up to \$676,000 paid out by Comstock mining companies for dividends and running expenses in April. A very lively corpse is the old lode.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, May 5th, \$122,000; and 9th, \$125,000—total for April, \$418,000; Hanauer, 4, \$1600; Germania, 4, \$2441; Hanauer, 6, \$1650; Moulton, 3, \$18,659; Savage, 8, \$10,700; North Belle Isle, 8, \$40,000; Confidence, 5, \$14,832; and 8, \$20,595; Silver Bow, 3, \$19,912; Hanauer, 3, \$1575; Silver Reef—for April—\$31,984; Germania, 5, \$4100; Hanauer, 5, \$1575; Mt. Diablo, 9, \$8762.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JOHN G. H. LAMPADUS—San Luis Obispo Co.  
 G. W. INGALLS—Arizona Territory.  
 A. F. JEWETT—Tulare Co.  
 O. E. WILLIAMS—Yuba and Sutter Co.'s.  
 R. G. HUSTON—Montana Territory.  
 E. H. SCHAEFFER—Butte Co.  
 S. J. LUTHERFIELD—San Diego Co.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

## News in Brief.

THE recent fire in San Diego caused damages to the extent of \$200,000.

ONE firm in San Jose sold over two tons of strawberries last Saturday.

THE Los Angeles Cracker Co.'s factory was burned last week; loss, \$50,000.

THE auction sale of foothill lands at Lincoln, Placer county, realized \$23,000.

INCREASING population has forced Redding to use additional power to supply water to the city.

COAL has been found in the Buttes, near Sutter City. It is a lignite much like that mined at Ione.

THE Copper Queen Co. at Bisbee, Arizona, discharges its miners if they are caught gambling.

THE City Council of San Diego has fixed the tax levy at 89 cents on a valuation of \$18,000,000.

THE Folsom prison has sold \$89,950 worth of granite curbing and coping since sales to the public were resumed.

A NOTED baseball player was killed at Indianapolis lately by the ball from the pitcher's hand, hitting him in the temple while striking.

THE Marysville Woolen Mills are still six months behind with their orders, finding it impossible to keep pace with the demand of their goods.

THE old San Fernando mission is to be preserved. The old church is to be repaired, and the many curiosities will be taken care of properly.

It is said that oil-fields more extensive even than those of the Caspian have been discovered in the Mackenzie River valley, close up to the Arctic circle.

THE salient point of the preface to General Boulanger's book is his advocacy of the right of the army to have a voice in the question of peace or war.

THE arrival of immigrants in this country for the first three months of 1888 were 5325 in excess of the arrivals for the corresponding months in 1887.

## New York Metal Market.

Telegraphic advices dated May 3d give the following New York prices:

BAR SILVER—92 1/2 per oz.  
 BORAX—9c.  
 COPPER—LARK—\$16.45.  
 IRON—No. 1, \$22.00.  
 LEAD—\$4.40.  
 TIN—\$21.00.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Dull, spot closing at \$16.30 to \$16.45. Transferable Notices (Lake) issued at \$16.20 to \$16.30.

LEAD—Steady, at \$4.65 to \$4.75 spot. Transferable Notices issued at \$4.40.

TIN—Nominal at \$21.00 to \$21.00.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.

Australian Tin, — @; Billiton Tin, — @; Banca Tin, — @; Baltimore Copper, \$15.00 to \$15.40; Orford Copper, \$16.00 to \$16.05; P. S. C. Copper, — @; Foreign Lead, \$9.10 to \$9.15; Foreign Spelter, \$6.00 to \$6.12; Antimony, \$10.75 to \$11.00.

FRISBEE-LUCOP MILL.—Two Frisbee-Lucop mills have been shipped to the new cement works at Portland, Oregon. These mills have each a capacity of from two to three tons per hour. A Frisbee wet-mill has also been shipped to the Copper Queen mine in Arizona. After the tailings leave the jigs they run to this mill, which will reduce them for further concentration.

THE National City Record denounces the Lower California gold stories as a tissue of falsehood, and remarks that "it is rather strange that men who claim to be able to take out \$10,000 a month from the placers should be wasting their time about San Diego, bragging about their finds, and telling the world where the wonderful riches are stored."

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-guards, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, postpaid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not know until we receive the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## New Almaden Quicksilver.

J. B. RANDOL,

Room 22

# THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

## CALIFORNIA VIGORIT POWDER CO.,

No. 40 California Street, San Francisco,

—MANUFACTURERS OF—

## NITRO-GLYCERINE

("DYNAMITE" or "GIANT")

### Blasting Powders.

Vigorit "LOW" Powder,

FOR REMOVING STUMPS AND TREES,  
HAS NO EQUAL.

WORKS: California City, Marin Co., Cal.

ED. G. LUKENS, Manager.

## CLAYTON AIR COMPRESSORS,

For Working

Rock Drills, Coal Cutters,  
Hoisting Engines and Water  
Pumps in Mines and Tunnels,  
Sinking Caissons, Elevating  
Acids, Transmitting Natural  
Gas, Atomizing Petroleum, &c  
For Catalogues, Etc., address,  
Clayton Air Compressor Works,  
43 DEY ST., NEW YORK.

WATER TANKS, WINE TANKS!  
CALIFORNIA WINE COOPERAGE CO.,  
FULDA BROS., Proprietors,  
30 to 40 Spear St., San Francisco.  
ALL KINDS OF CASKS, TANKS, Etc.  
SHIP, MINING, and WATER TANKS a Specialty.

## ELECTRIC DEVELOPMENT COMPANY.

### Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE,  
Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and  
GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO CAL.

WM. H. TAYLOR, President.

R. S. MOORE, Superintendent.

L. R. MEAD, Secretary.

# RISDON IRON & LOCOMOTIVE WORKS

Location of Works, S. E. Cor. Beale and Howard Sts., San Francisco.

Manufacturers and Sole Agents for the Pacific Coast for

## HEINE SAFETY WATER TUBE BOILER.

Has the Following Advantages:

**SAFETY,  
DURABILITY,  
ECONOMY,  
AND FACILITY OF INSPECTION AND REPAIRS.**  
60,000 Horse Power now in use.

Boilers can be seen working in San Francisco at Palace Hotel, Spring Valley Water Works  
Hucker Bros. & Co., California Jute Mills, and other places.

Guaranteed More Efficient than any other Boiler made.

BUILDERS OF

QUARTZ MILLS—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.

AIR COMPRESSORS—Rope Power Transmission.

HYDRAULIC PUMPING and Hoisting Machinery.

WROUGHT-IRON WATER PIPE a Specialty. Works.—Have just completed order for 36 miles of 44-inch

pipe of 4-inch iron for Spring Valley Water Works Company, San Francisco.

SAW-MILL MACHINERY of all kinds.

STEAM ENGINES—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.

SOLE MANUFACTURERS for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube);

60,000 horse power now in use.

MACBETH PATENT STEEL-RIM PULLEYS—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

REFRIGERATING MACHINERY for Steamships, Breweries, and Cellars.

WILSON'S PATENT GAS-PRODUCER.

STEAM BOILERS of all descriptions.

SUGAR MACHINERY—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.

STEAMSHIPS—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.

Builders of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 60-stamp Mill for Quartz Mountain Mining Company.

Send for Circular and Price Lists.

# COMPRESSED AIR and WATER POWER MACHINERY.

RIX & FIRTH, 225 and 227 First St., San Francisco.

## NATIONAL AIR COMPRESSORS.

SINGLE OR DUPLEX, STEAM OR BELT POWER.  
62 Sold on the Pacific Coast.

KNIGHT'S WATER WHEEL,  
—FOR—  
MILLS, PUMPING AND HOISTING.  
Over 300 in use. All estimates guaranteed. Send for Circular.

## MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth 350 feet, giving entire satisfaction to the prospector. Price, complete, \$200. 150 sold on this Coast.

NATIONAL ROCK DRILL.  
200 Sold on this Coast. Has less repairs than any other Drill.

NOTICE TO  
**MINING MEN,**  
 ENGINEERS, CONTRACTORS,  
 and others interested in  
 TUNNELING, SHAFT-SINKING, ETC.

Engineers' Tables of Progress  
 WITH MAPS, ILLUSTRATIONS  
 AND FULL DESCRIPTION OF THE  
**NEW YORK  
 AQUEDUCT TUNNEL.**

Section 16x16 feet; Length 36 miles.

 SAN FRANCISCO, CAL.

**GREAT REDUCTION!  
 BATTERY SCREENS.**

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

**PERFORATED SHEET METAL**

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot-Cut burr and Slot Punched screens. Mining Screens a specialty, from No. 1 to 15 (fine). Orders promptly attended to.

**San Francisco Pioneer Screen Works,**  
 21 & 223 First St., San Francisco, Cal.  
**JOHN W. QUICK, Proprietor.**

**THE PELTON WATER WHEEL**

Gives the highest efficiency of any Wheel in the world and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

**ELECTRICAL TRANSMISSION.**

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Tram cars, etc. Address

**The Pelton Water Wheel Co.,**  
 127 FIRST ST., SAN FRANCISCO, CAL.

**QUARTZ SCREENS**

A specialty. Round, slot or burr slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

**INVENTORS, TAKE NOTICE!**

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 5, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached.

We have at hand many testimonials, from well known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## The Nagle Engines and Boilers.

A number of forms of engine made in the East have been introduced on this coast within the past few years. One of the latest designs is the "T. M. Nagle," the agency of which has just been secured by Parke & Lacy of this city. These engines are built from entire new patterns with the latest improvements. There are several forms, one of which, the stationary boiler and detached engine, is shown in the cut on this page. This detached (center crank) engine is made in sizes from 6 to 15 horse power.

In all these engines special attention has been paid to make all parts plain, simple, strong and durable; all the wearing surfaces are unusually large. The material throughout is the best, and they are well made with the latest improved machinery, thereby assuring accuracy and durability. The frames are strong and well shaped. All the cylinders have hot air jackets which decrease the condensation in cylinder. The arrangement of the steam chest and steam ports is such that all the water forming in the cylinder is readily carried off, the ports extending below the bottom of cylinders, and the heaters being at all lower, a perfect drainage is secured; the heaters are independent of the frames, and all the pipes are easily accessible. The pumps are large and simple, firmly secured to cylinders and unable to get out of alignment; they are provided with large air-chambers and brass valves and seats, which can be readily taken out and replaced while the engine is working at full speed.

The center cranks are large and made of solid forging. The pistons are fitted with self-adjusting steam packing rings and do not require any attention, nor do they cut the cylinder. The connecting rods are of the most substantial character—of wrought iron, with straps, bolts and keys to take up the wear of the brass-boxes. The governor regulates the speed of the engine perfectly; they are provided with "speeders" to change the speed of engine while in motion, and also a hand-lever attachment to the valve, which is convenient for controlling the speed of engine when a uniform speed is not wanted, as when sawing, for instance. The general design of the engine is neat and compact.

The boilers for the portable engines are of the plain water-bottom furnace style, of the most approved proportions, and give the most general satisfaction; have large furnaces with removable fronts, giving easy access to fires, etc., for thorough cleaning and repairs; fusible plugs in crown sheets which will melt in case of low water in boiler and allow the steam to enter into furnace and put out the fire. The water bottoms admit of free circulation of water, and are a perfect safeguard against fire under the furnace and allow the sediment to settle below the line of the fire. Hand-holes are provided

in suitable places, in addition to the blow-off valve, to give easy access to the inside for cleaning. They are made of the best steel, and are tested at 150 pounds hydrostatic pressure.

As soon as the Chollar mill is again started up it will be by the old system of amalgamating. The tanks are all in place and will be ready to receive the ore pulp from the stamps as soon as crushing is resumed. The adoption of the tank system will admit of an increase of 50 tons daily above the amount of ore handled

**THE GUADALUPE MINE.**—In the action of the Santa Clara Mining Association of Baltimore against the Quicksilver Mining Company to recover possession of a portion of the Guadalupe mine, Judge Sawyer has filed a decree stipulated upon by the counsel engaged in the cause. Under this the complainant is awarded Lot 39, Township 8 south, Range 1 east, and Lot 40, Township 8 south, Range 1 west, Mount Diablo meridian, containing 1109.67 acres situated in Santa Clara county, and the defendant is forever enjoined from asserting any right to the

## Mining Stock Schemes.

It is strange that the promoters of mining schemes cannot see that it is their interest in the end, if not immediately, to give the capitalist a fair chance to multiply his investment many times in case of success, when he takes all the risk. Instead of doing this, an enormously inflated price is asked, and often obtained, with glowing representations. Phenomenal success must be had in order to even make good the price asked, let alone any profit.

It is this practice that has so disgusted the outside public with mining shares.

We have before us the prospectus of a company capitalized at 500,000 shares, and the promoters desire to dispose of enough "to develop the property"—a gold mine. No outfit is claimed and no equipment, but it is now a great producer. A portion of the stock is offered at the modest rate of \$1,000,000 to obtain money "to develop," or, in other words, to make the mine worth anything. The owners of this mine probably think they are a charitable institution to make such a liberal offer! It is dead sure to pay 25 per cent dividends when developed, they say. We would remind these promoters that stocks are selling on the board here every day at a rate that pays 5 to 8 per cent a month dividends, and the public don't bite very greedily.

Another scheme is before us from New York, a little more liberal. The property is in one of the old mining counties, with two shafts on it less than 100 feet deep. The ledge is 100 feet wide, and the ore as

STATIONARY BOILER AND DETACHED (CENTER-CRANK) ENGINE.

by the Logan process, and swell the monthly bullion product of the mill at least \$20,000 above the proceeds under that system of amalgamating. Iron pipe for leading the water down the shaft and incline to drive the dynamo for operating the mill by electric power is being delivered on the ground from the Combination shaft. The excavation of a station for the reception of the Pelton wheel and dynamo on the 1700 Soto Tunnel level of the Chollar main incline is being pushed to completion, and the five dynamo have been shipped from New York. The plant will be ready for a test run next July.

**A CHINESE PATENT SUIT.**—The only Chinese patent case ever brought in the courts was decided this week by Judge Sawyer. In 1885 Lam Tuck Chea obtained a patent for an improved Chinese lantern, which Fong Tang and Fong Mon Gip infringed. The injured Mongol immediately sought redress and prayed for the usual injunction and accounting, but Judge Sawyer refused to sanction the proceedings for want of novelty. In other words, the defendant showed that the principle involved in the invention was used in China and in this country long before the letters were issued. The bill was, therefore, dismissed.

land or bringing any action respecting it. The ownership of all other portions of the land which is known as the "Guadalupe Grant" is given to the respondent.

**MR. F. G. NEWLANDS** has told a reporter that it has been decided by D. O. Mills, himself and others who own the Carson & Colorado railroad, to extend that line from Keeler, on Owens lake, Inyo county, Cal., 100 miles to Mojave, connecting there with the Southern Pacific and Santa Fe systems. "The extension will open up to Nevada," said Mr. Newlands, "a large trade in lumber, ice, etc., in Southern California, and also give a market in Nevada for Southern California products."

One day last week a cave occurred in the Utica mine, Angela camp, on which occasion over 500 tons of material and debris came down. The coming of the cave being attended by the breaking of timbers and other warnings, the men employed in the mine succeeded in escaping without injury.

**DURING** the fiscal year ending February 20, 1888, the hullion-producing mines on the Comstock lode paid the Soto Tunnel Company a total of \$237,258.33 in royalties for ore extracted.

say—lots of assays but no mill runs—about \$50. The tenderfoot is given to understand that the whole ledge, for several thousand feet, is good for \$50, a veritable bonanza of copper, silver and gold. The public can have a slice of this at the rate of \$400,000 "to develop the property."

Comment is unnecessary. Mine-owners must remember that what works a mine is money. Prospects are plenty, and of little worth till shown up with capital, and it behooves mine or prospect owners to give capital the lion's share in their possibilities. Capitalists must be given an interest when they take the risks of developing a property, that they will get not a small percentage, but a multiplication of their investment in case of success, as failure means total loss.

It is useless to disguise the many contingencies of mining. While we deny it is a gamble, yet the public has come to think so by reason of taking shares in just such propositions that could work the investor any money, only in case of success as phenomenal and rare that few ever realize it.

**PROMINENT** men in the East express the opinion that the Coleman failure was due to an attempt to corner the horax market.

## CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—Eds.

## Boulder, Montana.

[From our Correspondent, R. G. HUSTON.]

My last communication brought me up to Wickes, and I see that unfortunately the notice of Montana Central tunnel became segregated in some way and tacked on the notice of Jay Gould district, when it should have come in under the head of Wickes.

Boulder City, the county-seat of Jefferson county, is 12 miles south of Wickes, and is now connected by railroad with the main North Pacific line by the Boulder valley branch, leaving the Wickes branch at Jefferson City, and climbing the range at the head of Prickly Pear creek and a short tunnel at the comb of the range. The elevation is reached by very heavy grades and a very crooked road leading in and out of the gulches and depressions in the mountain. To look down over it one would almost think it impossible; yet they have been operating successfully for the past six months.

The Montana Central have, it is reported, made arrangements to use this route until their tunnel is completed, which will be November at least, and they will iron their road, which is all graded and completed, to Butte via Boulder. This will give Butte another railroad, and will also give Boulder the advantage of a second railroad and connection with Butte. The North Pacific Boulder valley branch is completed and in running order to Calvins, 22 miles east of Butte, but owing to a pool complication with the Union Pacific, they were compelled to stop there indefinitely.

The Jefferson county people held an election to legalize their issuing bonds to build a courthouse, and it was carried by nearly 1000 majority. The cost of the courthouse and various other improvements in eight will approximate \$100,000 for the season for the county-seat.

## Mines in the Vicinity of Boulder.

The Amazon mine and smelter, some four miles north of town, have been operated by the Helena Mining and Reduction Co., and are now shut down; but a large amount of prospecting is going on here on the different properties. The Ella Co. are sinking their shaft deeper, and are doing no other work at present.

J. C. Sloss is operating a small force of men on the Bismarck, and Von Armin is running a tunnel to strike the ledge at some 200 feet below the old works. A large quantity of high-grade ore was mined and shipped from these two properties, before the railroad was completed, to Montana. If the ore chutes continue down, they will develop them, and with the present shipping and home reduction facilities good money can be made from these grades of ore.

## Elkhorn District.

Twelve miles east of Boulder, is an old producer, but during the first half of the past 12 months labored under great difficulties in her main stay, the A. M. Holter mine, for several months drowned out. Their old pumping plant was insufficient to handle the extraordinary amount of water of last season.

They are now permanently fixed for all occasions of this kind. J. W. Pender took charge of the mine last August, and was given carte blanche to place the mine in shape for mining, and he has faithfully fulfilled his trust, as the following will show: When he took charge there was 450 feet of water in the main working shaft or incline. Since that time he has cleared it of water, sunk the shaft 150 feet deeper, dressed out the shaft, which was in many places scarcely high enough to pass the car, and relaid the track with good heavy T rail. Before, only wood with strap iron was used, and the car was continually running off the track. He has run a 14-inch pump column to the bottom of the shaft, and is now busy cutting out a pump station 22x30 feet, for a large compound duplex double-acting Knowles pump. With this once in place, the water matter will be completely cared for. The ordinary pumping capacity of three pumps is 3,500,000 gallons daily, and double it if necessity requires. He constructed a skip for hoisting two cars from the incline, thus almost doubling their hoisting capacity.

Levels have been run east and west, winzes sunk and upraises made, thus developing more than 10,000 tons of ore. The mine is lighted throughout with incandescent lamps, and rapid progress is due in a large degree to the use of the Burleigh drills.

On the surface, almost as much progress has been made. Their machine shop has been fully equipped with the necessary improvements to enable them to carry on their own repairs without the delay of shipping to Helena. A new 60 inch White & Howell roasting furnace was added, the old one being about worn out, and too small to handle the increased amount of pulp.

Five stamps are being added to the plant, making it a 25-stamp mill, and in a short time the Elkhorn plant will be brought to the front as first class in every respect.

They ship some of their highest grade ore and have a drying and sorting house for this purpose. A new boiler is being put in, giving additional power enough to run the whole concern with ease. C. L. Vanter is still the general manager of the Elkhorn Co., and the hus-

ness affairs are running along in their usual quiet, unassuming manner.

The company deducts a hospital fee from all employees, and Dr. W. H. Dudley looks after them when his services are needed.

The company guarantees all board bills, and consequently there are no grumbling boarding-house keepers. I must confess I think it is the proper thing that a man working and receiving miners' wages should be compelled in some way to pay for what he consumes in the way of food before he blows his coin in on whisky, as is many times the case.

The J. R. Keene was owned when I was here before by Messrs. Nicholson and Jemison, and was then considered a very flattering prospect. Since that time it has been incorporated with 100,000 shares of \$5 each. Development have been continued and a number of carloads of ore shipped with good results.

Their main shaft is down 350 feet, and several hundred feet of levels run with satisfactory evidence of the pay continuing down. Some very rich ore was opened up a few days ago. There seems to be no reasonable doubt of the J. R. Keene becoming a regular bullion-producer in the near future.

## The Union.

Located one mile north of the Holter mine, is stocked for \$750,000. It is developed by a tunnel 300 feet, run on the ledge; vein from 2½ to 3 feet in width. The end of the tunnel is about 100 feet in depth from the surface. The company shipped three carloads of ore which averaged over \$100 per ton. This was shipped from the dump from a tunnel without any stoping.

## The Dunstan.

Located a short distance north of the Holter mine, and also stocked for a million, is developed by shafts. The deepest—50 feet—shows a ledge of about three feet of ore. One ton of first-class ore sampled over \$150, and second class from \$30 to \$40.

## The Paymaster

Is an extension of the Dunstan, and very much the same character of ore has been found. But little work has been done.

## The Luxembourg

Is a patented claim. Shaft down 60 feet, and are carrying copper, silver and gold was struck. Is not doing anything at present.

## The C and D.

Owned by Messrs. Clarke, Toole & Woolston, is ½ miles northeast of the town. It is developed by tunnel 300 feet, and shaft down from tunnel 100 feet. Two other shafts are on the ledge. Crosscuts have been run in several places and show this to be one of the largest ledges in the section; over 30 feet in width of an ore body is a pretty strong vein. They built a 60-ton smelter here nearly two years ago, and have made several runs with it, but at present it is shut down. There is no doubt of the C and D proving a valuable property, but the lead percentage is pretty small, and the expense of getting in the proper fluxing by way of teams over a very rough road makes it come too high for any ordinary mine.

The Montana Central and North Pacific have each a line surveyed in here, and surely one or the other will be built and then smelting at the mine will be a possibility.

## The Relief

Is located a short distance from the town. It is a stock company with a capital of \$1,500,000. Shaft down 200 feet. Crosscutted at 100 feet, found 8 feet of ore, and many assays were made of over \$100 per ton. At the present writing, are crosscutting at the 200-foot level, but have not yet reached the vein.

## The Keystone.

North of the C and D, is another company with a half-million capital stock. The shaft on the vein is down 80 feet, and a tunnel 300 feet in length to tap the vein has not yet reached it. They have yet to run about 50 feet. This will drain it to a depth of 150 feet and will thoroughly develop the property. In the shaft they had five feet of ore with assays of 60 ounces silver and 30 to 40 per cent of lead.

## The Louise

Is another stock company. Their development are a shaft 200 feet deep and they are now crosscutting for the ledge; nothing known of the ore developed.

## Mountain View

Is owned by Messrs. Fuhrkins and Thompson. It is developed by two tunnels—one run on the lead 100 feet and another running to strike the ledge at a depth of 400 feet. A solid galena ore is found running from 40 to 50 ounces in silver and 40 per cent lead. This is a very flattering prospect.

## The Elkhorn Queen

Is still another stock company. They have a shaft down 200 feet, and where the ledge was crossed they found a very large body of low-grade concentrating ore, containing lead and silver.

## The Highland Mary

Is a new discovery by A. A. McMillan & Co. It runs high in gold. Assays have been made as high as \$275 per ton. The tunnel is in 90 feet and there is a promising outlook.

There are many others with more or less work done, but these comprise the most developed and the ones having the best outlook for the future. The town is but little improved from one year ago—two good general stores and three ordinary hotels and the usual number of saloons with which every mining camp is endowed.

## The Copper Product.

## The Annual Report of the United States Geological Survey.

The official report of the product of copper in the United States for the year 1887 was issued recently by the Division of Mining Statistics of the United States Geological Survey. It is presented by C. Kirchhoff, Jr., of that department, and contains some very interesting statistics, both of the production and consumption of copper during last year. Considerably over one-half of the world's copper is produced on this continent, namely, in the United States and Chili. The former, however, leads all other countries in this industry, the product having doubled during the past six years. If a proportionate rate of progress is maintained during the next few years the United States mines will turn out at least 100,000 tons annually, which will enable them practically to control the world's market.

The total production for 1887 is stated by Mr. Kirchhoff to have been 181,170,324 pounds, of which Michigan mines produced 75,471,890 pounds; Montana mines, 78,699,677 pounds; and Arizona mines, 17,720,462 pounds. From this statement it is seen that Michigan is no longer the leading copper-producing State. Montana has shot ahead by 3,000,000 pounds. The Lake Superior District of Michigan was for a quarter of a century the center of the interest, but the discovery of the great Anaconda mine in Montana has given the Territory pre-eminence. This mine has fair to become even more famous than the Calumet and Hecla of Michigan, which up to within a year has been known as the largest copper producer in America. Montana's rise to pre-eminence has been truly phenomenal. Six years ago that Territory was credited with an annual product of less than 1000 tons. The actual quantity for 1881 was 875 tons. The copper product of Montana for the past seven years has been as follows:

1881, tons.....	875	1885, tons.....	30,267
1882.....	4,014	1886.....	25,067
1883.....	11,011	1887.....	39,350
1884.....	19,238		

The world's product of copper for the eight years ending January 1, 1887, was as follows:

1870, tons.....	151,089	1883, tons.....	108,341
1880.....	154,068	1884.....	218,774
1881.....	163,030	1885.....	229,427
1882.....	181,438	1886.....	212,556

The official returns for 1887 have not been made public. The total may be approximately stated at 220,000 tons. The four heaviest producing sections of the world are Spain and Portugal, which turn out from 30,000 to 45,000 tons per annum; Chili, which turns out from 35,000 to 50,000 tons per annum, and the United States, whose yield has been more than trebled in the past decade, as the following table will show:

1879, tons.....	22,000	1883, tons.....	51,574
1879.....	23,350	1884.....	65,708
1880.....	25,010	1885.....	74,052
1881.....	35,850	1886.....	72,848
1882.....	40,465	1887.....	90,585

The average price of ingot copper at Eastern centers for the 10 years ending January 1, 1887, was as follows:

1877.....	18 50	1882.....	18.41
1878.....	16 42	1883.....	16.55
1879.....	17.35	1884.....	13.72
1880.....	20.15	1885.....	11.14
1881.....	13.27	1886.....	10.95

The highest price during the interval was 24½ cents, in 1880, and the lowest 10 cents, in 1886. The average for the first six months of 1887 was 10 87.

About July last, when the price of the metal in London had dropped to £38 10s., a syndicate was formed in France for the purpose of obtaining the control of the copper product of the world for a term of three years. Stocks in all the leading markets were bought up, as well as the bulk of all the supply expected for the next three years, and the price advanced to £80 and upward in London, with the corresponding equivalent in this country.

The organization which has taken hold of this movement is known as the Societe des Metaux. Though not entering the field until the latter part of 1887, it claims to have made a profit of 16,000,000 francs in 1887, against less than 2,000,000 francs in 1886. Its stock of copper at the close of 1887 was invoiced at £64 per ton, as compared with £39 18s. per ton at the close of 1886.

ELECTRIC MOTORS AND THE STEAM ENGINE. There are certain enthusiasts who do not hesitate to say that the motor of the future will be the electric motor, and that the use of motive power is to be almost indefinitely extended. But, with curious inconsistency, they assert, in the same breath, that the steam engine must go. Those who look a little deeper into cause and effect understand that if the wildest dreams of electric enthusiasts were instantly realized, so far as to use electric motors—if it were possible—wherever power is now furnished directly by steam engines, the world would be enormously short in steam engines, and steam engine building would be, for a time, by far the greatest business of the age. The power that does the work of the world by steam would be entirely inadequate if this power had to be furnished through the connecting link of electric motors, with the attendant waste of energy. The steam engine will stand at least until the dreams of those who hope to make electricity direct from coal assume tangible form, and even then there is great probability that it will continue to be

"the great prime mover." This is not saying that electric motors will not come to be used to a considerable extent, but steam engine builders can console themselves with the fact that every one substituted for steam direct will give them more instead of less work.—*American Machinist.*

## Shade Trees for California.

The public is indebted to the Sacramento Improvement Association for drawing out the observations of several experienced tree-growers of the capital city as to the adaptations of certain trees for planting in this State. Of course what is best for Sacramento is not necessarily best for some other parts of the State, but the remarks, which we shall reprint below from the report in the *Record-Union*, have a wide bearing.

## The State Gardener's Views.

David Meldrum, the State Gardener, who has charge of the beautiful grounds around the State Capitol building, said he had been requested to prepare a list of trees suitable for street and avenue planting. He favored ornamental evergreens. Of the evergreens the magnolia grandiflora was a very fine ornamental tree. The Italian holly had a very bright foliage, was a beautiful tree and had a fine shape. The Portugal laurel was most beautiful for street planting; it had a beautiful foliage, long chains of white flowers, pleasing to the eye, and very fragrant. The araucaria excelsa was one of the finest ornamental evergreen trees in California. It is a native of Norfolk island, Australasia. There are two other varieties of the araucaria, the Bidwillii and the imbricata, that are also handsome ornamental trees and would do well in the Sacramento climate. The Grevillea robusta is a most beautiful sidewalk tree. It grows rapidly, is palm-like in shape, and is one of the handsomest lawn trees that grows. It grows to a height of 50 or 60 feet, and is quite hardy. The American arbutus is a fine tree, there being some excellent specimens of this species in Capitol Park. The Siberian arbutus is also a fine tree. The Sequoia sempervirens, redwood, a native of California, the "big tree," is excellent for sidewalk planting and much admired by Eastern visitors. The Lawson cypress and the Monterey cypress are both excellent trees.

Regarding deciduous trees for lawn or sidewalk planting, my observation is that there are a half dozen or more varieties that are suitable. The white elm (*Ulmus americana*) and the cork elm, are both good. The Oregon maple is a fine tree, as is also the Norway maple. The latter grows well in Sonoma county. The tulip tree is a fine grower, has a smooth bark, and bears most beautiful flowers, and for an ornamental tree has few superiors. The Eastern yellow poplar and sugar maple do not do very well here. I would not recommend those or any other species that I am not acquainted with. The cost of these trees varies all the way from 50 cents to \$10 each.

## Views of a Practical Florist.

F. A. Ehel, the well-known florist and nurseryman, was next called upon. He said in selecting deciduous shade trees he would by all means recommend the cork elm, as it makes the best and most symmetrical tree, is entirely free of insects and requires less care than any other large-growing tree. The horse-chestnut is a fine growing tree and no pruning is required. Then the European linden (*Tilia grandiflora*) requires, perhaps, a little more care in the beginning, but which amply repays by its beautiful foliage and fragrant blossoms in the early summer. The Norway, silver-leaved, sugar and variegated maple is also fine for shade trees. The tulip tree (not much known in this part of the country) is a beautiful, even-shaped tree, and requires no trimming whatever. Its beautiful flowers are produced on the tip end of the branches and resemble the tulip, from which the tree derives its name. I saw 50 or more of these trees, all of the same height, surrounding a small lake in central Germany (Hesse Cassel) and never have seen a prettier sight. Then we have the ash, beech, hick, China umbrella and other trees well adapted for this section.

Of evergreen trees he would recommend the magnolia grandiflora, familiar to everybody. Grevillea robusta, pepper tree, several species of acacia, also laurels, pittosporum, palms, pichardia filamentos, chamærope excelsa, phoenix canariensis and dactylifera, all of which, with proper planting and a little care in the start, will make a showy sight, especially if deciduous trees are planted alternately with the evergreen. In his opinion the deciduous tree, during the winter, when it is without foliage, is still a protector to the more delicate evergreen thus planted with it. The trees so planted should have plenty of room, and by the time the evergreen is large enough, the deciduous trees may be disposed of altogether.

As for mode of planting, a large hole should be dug for all trees; the top, or better soil, should be thrown into the bottom of the hole, and, if necessary, should be filled entirely with new soil. The cost of doing so will amply repay in the growth of the trees. With evergreen trees persons should take good care that trees are not stunted or pot-bound, as it will take a long time for them to get over it; in fact, healthy trees should always be selected, and the best way to accomplish this, none but an experienced person should be trusted with selecting them.

It is rather a difficult matter for me to speak

of, as to give any rule or regulation for pruning is almost impossible. Different trees will need different treatment, and if people in general will employ none but skilled hands to do it, there is very little danger that a tree will be ruined by pruning. The greatest trouble is that most people are the best pleased with the man who cuts off the most branches, they not knowing themselves what is right in regard to pruning trees. A close observer will find throughout the city that the most trees are spoiled by too much pruning. For example, a cork elm should be trimmed and shaped in the first and second years after planting. When that is done properly, the tree will take care of itself better. A person that knows nothing about pruning will spoil more in one hour than the tree will make good in five or ten years.

#### Mr. Williams's Views.

Robert Williamson, the well known nurseryman, and a member of W. R. Strong & Co., next added his views. He said he had been highly entertained with the remarks of those that preceded him. Their views were excellent, their selections admirable and their suggestions good. He said of all deciduous trees, however, he thought the cork elm the finest. It was a strong grower, symmetrical and uniform in its habits. The American elm was not uniform in its habits; one would be weeping, another upright and another straggling. He grew the cork elm from cuttings, and got uniform trees in every instance. The silver maple he regarded as a very fine tree. It had a uniform habit, and that was the beauty of a street or avenue, to have it all look alike. This committee, of course, cannot dictate what kind of trees shall be planted, and there will be as many varieties as tastes in the same block. What we should endeavor to do is to

#### Educate the People

Up to the fact that the best should be adopted, and then all on the same street plant that and none other. The Carolina poplar would do well in the lower or southern portions of the city. The handsomest tree in the city to-day is the China umbrella trees in Add C. Hinkson's yard, at Twenty-third and H streets. There is no trimming to be done; all you have to do is to get it up. The prettiest avenue I ever saw was one shaded with umbrella trees. If the tree is ten feet high, then it is ten feet across; if 20 feet high, then 20 feet across, and a perfect umbrella. It has a dense green foliage. If you want to make selections of evergreen trees, you must take the character of the soil into consideration. The excelsa araucaria wants a moist climate, but the Bidwellii will do well in this section. The Monterey cypress is a good tree, is cheap and can be obtained almost anywhere. The Monterey pine is another cheap tree, and will grow almost anywhere. The Greveillea robusta won't stand a cold snap or heavy wind. The sugar maple is a slow grower and is a failure here. The tulip tree grows slowly here, and not so luxuriantly as in Germany. The magnolia grandiflora may stand at the head of the list, as Mr. Meldrum says, but it is a slow grower and a very expensive tree. A tree from two to four feet high costs all the way from \$1 to \$2.50.

There is a tree that has been suggested to me by Mr. Gillet of Florida, and that is the wild orange. It is a beautiful tree, a rapid grower, hardy, and will stand more frost than the sweet orange, the fruit hanging on the tree for several months after it is ripe. The small boy will let them alone, for if he tastes one once he will never do so again. The fruit is large, and finer looking, if anything, than the cultivated varieties. Those who want a good cheap tree can do no better than plant cork, maples or palms. The California palm is the best, because it is hardy and a rapid grower. The suggestion of Mr. Ebel to alternate the deciduous trees with evergreens, is an excellent one.

The Florida orange, in my opinion, is the best tree we can possibly get. We can club together, get some of these colonies to go in with us, and get out a carload of 5000 or 6000 trees. I would like to see our streets set out with wild orange trees. In Jacksonville and other cities in Florida they have no other shade or ornamental trees, and the sight is truly beautiful, and if we had it here the sight would simply paralyze the Eastern visitor. They require no more, in fact not so much water, as other trees.

The blackwood acacia is a fine tree, as are also some of the pepper varieties, and they will do well in the eastern suburbs.

Mr. Williamson was asked how large the wild orange tree grew, and he replied those on the public streets in Jacksonville were 40 and 50 feet in height, of fine symmetry, never required any pruning, and no care. Their foliage is a dark green. The speaker gave some general views on tree-planting and pruning. He said Sacramento had a number of wood hutchers going around town hacking trees to pieces. They added nothing to the beauty of the trees, and did much to injure them.

#### A Weather Expert's Opinion.

Samuel Gerriah, a gentleman who has always taken a great interest in the cultivation of semi-tropical plants, was next called upon. He said: "The beauty of any city that makes pretensions to a semi-tropical climate is in its verdure in the winter season. If the trees that will grow equally well in a more northern climate are largely planted, they will present an uninviting aspect to tourists from cold climates. Therefore it is better for us to plant those trees that retain their green foliage during the en-

tire year. If one were to be taken to the State Capitol building and look over the city, he would see very little verdure on the trees. It presents a true winter aspect—trees with naked branches everywhere. It is true these trees are fine in summer, but in the coldest climate they are the same. If we boast of a semi-tropical climate, let us show travelers that we also grow semi-tropical trees.

"The habit of tree-trimmers and gardeners of treating semi-tropical evergreen trees as they would hardy deciduous trees is suicidal, for many of them have been killed by this method. Orange, eucalyptus, olive and all trees of their tender nature should be pruned in the spring, and not in the fall, to suffer from the cold and set back if not ruined. The olive tree is not a slow grower, as compared to the orange, is very hardy, and for a shade tree in the city is beyond question desirable, as it will root well and stand the winds. The magnolia grandiflora is also one of the very best. These three va-

#### The Southern Pacific Railroad.

There is much of public interest in the report of the Board of Directors of the Southern Pacific Company for the year ended December 31, 1887, just issued. During that period the company operated 5576.04 miles of road, of which 3888.88 belonged to the Pacific system and 1687.16 to the Atlantic system. The gross earnings for the year were \$37,930,161.51; operating expenses, \$22,712,198.32; earnings above operating expenses, \$15,217,963.25; rentals received, \$574,691.12; total surplus, \$15,792,654.37; rentals paid, \$1,911,650.56; taxes, \$1,022,263.41; balance surplus, \$12,858,750.40. Adding to this surplus \$652,943.95 interest and income, a grand total of \$13,511,594.35 is reached. Out of this was paid the interest on the bonded debt, \$9,364,503.82; \$1,200,000 to

#### Cables and Electricity.

C. B. Holmes, President of the Chicago City Railway Co., writes as follows to the *Street Railway Journal*:

But when all other points have been covered, there still remains that of economy, which must always be paramount and final. A motor may be sure, swift and good, but unless it can be operated with economy, it is as valueless for practical purposes as though it had never existed. And this is a condition in which the great public is even more vitally interested than corporations or stockholders. No company can carry people at a loss, hence that system which can transport the passenger at half the cost of horse-power, can better afford to carry him twice the first distances by the cheaper motor. And this is precisely what the cable does. For months past the cable in Chicago has been carrying thousands daily eight miles for five cents. Where is the electric motor that has ever attempted it? Eight miles for five cents is just half the sum for which the service could be performed by horses on this line for years previous. These eight miles are made in 40 minutes, including just as many stops as the riding public may desire, to take on and discharge passengers.

In these days of intelligence a truly meritorious and economical motor will force itself to adoption and use, whether liked or disliked by its adopters, just as surely as oil rises and floats upon the water. It is not a question of choice, it is a matter of necessity.

When an electric motor will draw trains of three or four cars, carrying 200 people, at intervals of 40 seconds, for 15 hours in the day, year in and year out, starting from the very heart of the city, and ending away out in the country, in heat or cold, wet or dry, snow or dust, for 11½ cents per car per mile, at the rate of 10 to 14 miles per hour, then, and not till then, can it ever claim to equal or approach the cable-system as a motive power.

Do you know that after all this hue and cry about electricity only four cars operated by the storage battery system have actually been contracted for by the street railway companies of this country up to the present time? All the electric cars in actual service in America to-day are operated either by the overhead wire or the third-rail system.—Col. H. M. Watson, President Buffalo St. Railway.

I FOUND that the cable roads in San Francisco ran with admirable regularity and with satisfaction to every one. The cable lines there are conducted under far greater difficulties than in St. Louis, but on the coast the roads have all had their trials and are thoroughly broken in. One cable line is 15 years old.—President Julius S. Walsh.

It has been demonstrated that a speed of eight miles an hour can be safely and satisfactorily maintained through crowded thoroughfares by the use of the cable system.

#### A Monument to Audubon.

The Linnæan Society of New York asks contributions to assist erecting a monument to mark the resting place of John James Audubon in Trinity cemetery, New York City. The movement originated with the Academy of Sciences of that city and, we are told, has been met with much favor. The presenting of the enterprise for the favor and support of the public, has been confided to the committee appointed from the Linnæan Society of New York, who now issue their appeal.

We are largely indebted to Audubon for the present lofty standard of American natural history, his name has given inspiration to many, and the grandeur of his achievements in this department of science has produced a line of successors of which America is, and may well be, proud. Genius knows no national bounds, great men are cosmopolitan; in honoring Audubon, the American-Frenchman, the hunter-naturalist, the artist-ornithologist, the indefatigable and ardent lover of nature and depicor of her manifold beauties, we feel that all the world will heartily commend the project and rejoice at its successful conclusion.

The engraving on this page represents the proposed monument, which it will be seen calls to mind the leading features of Audubon's life-work. We have thought that there might be many on this coast who would like to share in the effort to signify the popular appreciation of the distinguished naturalist and his work. Contributions may be sent to L. S. Foster, Chairman of the Committee, care of Linnæan Society of New York, 11 West Twenty-ninth street, New York city. We are assured that a prompt acknowledgment of receipt of contributions will be made.

LARGE BRASS DRAWINGS.—One of the new elements of construction rendered necessary by the invention of the dynamite gun by Capt. Zilinski, has been the need of a brass shell for the projectile. A firm in Waterbury, Conn., have succeeded in making shells of seamless drawn brass, with conical head 3-16 inch in thickness, and weighing 200 pounds. Their length is 6 feet 8 inches, and inside diameter 14 inches, the whole being in one piece produced by the cold flow of the metal drawn into shape with the hydraulic ram. This shell is designed for the purpose of carrying 600 pounds of explosive gelatine, as a charge for Capt. Zilinski's dynamite guns.

DESIGN OF PROPOSED MONUMENT TO AUDUBON.

eties are suitable for a moist, sandy or any kind of soil, but require water. The fan palm tree (*Chamerops excelsa*) is the most hardy of all palms; never had a leaf touched by frost in this city; grows rapidly, attains a height of 40 feet, and is elegant for a sidewalk tree. There are many others that would add to the beauty of the city. The pepper tree does well if planted where it can root in a stiff, dry soil, but is not free for our wet seasons here, as it will not root, and blows down in any high wind.

"The 30 varieties of eucalyptus should furnish many specimens of this beautiful tree to decorate our streets. Let us by all means study this question and urge all our citizens to adopt the methods of our Southern brethren, and make our city smile in winter."

CAMEL'S HAIR BELTING.—According to experiments recently made at the Royal Polytechnic School at Munich, the strength of camel's hair belting reaches 6315 pounds per square inch, while that of ordinary belting ranges between 2230 and 5260 pounds per square inch. The camel's hair belt is said to work smoothly and well, and it is unaffected by acids.

THERE is no apparatus for the transformation of energy that compares in simplicity and efficiency with the dynamo-electric machine and electric motor.—*Science*.

the Central Pacific for rentals; betterments and additions to leased property, net, \$487,682.90; profit due lines under lease, net, \$417,274.50. The grand total of expenditures thus runs up to \$12,476,734.39, leaving a net surplus over all of \$1,034,959.56. The increase in gross earnings over that of 1886 was \$6,132,279.55. The net profit of the Central Pacific under the lease for 1886 was \$1,324,998.31, as against \$1,086,733.31 for the year 1887, a decrease of over \$200,000. The net profit for 1887 was \$113,266.69 less than the annual rental, and this deficit is payable by the Southern Pacific Co. In General Manager Towne's report it is stated that in 1887 there were carried by the system 7,846,203,090 pounds of freight, an increase of 11.01 per cent over the previous year. There were carried 10,163,462 passengers, against 9,174,010 in 1886. The increase in local travel was 20.02 per cent, and in ferry travel 5.94 per cent.

Mr. Towne concludes his report with the following language:

"In no period of the history of our roads or of the country has there been a time when so much might truthfully be said of this great State. California's prosperity is doubly assured, and rests upon a solid and enduring foundation. Her products find ready market in all parts of the world, and the development of commerce, agriculture and other industries has but just commenced."

## TABLE OF CONTENTS.

ILLUSTRATIONS.—Stationary Boiler and Detached (Center Crank) Engine, 309. Design of Proposed Monument to Audubon, 311. Section of Hydraulic Gravel Elevator, 313.

EDITORIALS.—The Nagle Engines and Boilers; Mining Stock Schemes, 309. Passing Event; Bullion vs. Copper and Lead; Quicksilver and the Tariff; Watching the Hydraulic Miners; Pioneer Mining Companies, 312. Hydraulic Gravel Elevators; Congress of Anthropology, 313.

CORRESPONDENCE.—Boulder, Montana, 310. MISCELLANEOUS.—The Copper Product; Shade Trees for California, 310. The Southern Pacific Railroad; Cables and Electricity; A Monument to Audubon, 311.

MECHANICAL PROGRESS.—A Few Rules for Lubricants; The March of Invention; Rolling and Forging Iron; A Mammoth Steam Boiler; Improvement in Speed of Electrical Transmission, 314.

SCIENTIFIC PROGRESS.—The Development of Speech; Curiosities of Magnetism; More and More with the Facts of Science; Engraving by Gunpowder; An Air Pump Compresses Air Higher than the Steam Drivings It; Cutting Diamonds; The Geological Map of Europe; Fire Damp as Fuel; Electrical Employment, 314.

GOOD HEALTH.—For Fat People; A Substitute for Cocaine; A Simple Health Suggestion; Remedy for Poison Oak; Removing Mole, 315.

USEFUL INFORMATION.—Cuttings for Flowers; Castor Oil as a Lubricant; A New Hectograph; Mathematics and Arithmetic; The Decimal Money Question in England; To Clean and Polish Brasswork; To Draw or Write on Glass; Finding the Sun in a Storm, 315.

ENGINEERING NOTES.—The Sustaining Power of Piles; A New Invention; A New Safety Car-Lamp and Heater; A Tidal Water Wheel; An Elastic Ship, 315.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 316-17. MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 320.

## Passing Events.

Silver has been gradually going backward in value until this week it is 92 for pure silver or 82.8 for the mint standard of 900 fine. It has never been lower than this but once, and that was two years ago. The present figures are very unsatisfactory to producers of silver bullion.

The building of a railroad to the big copper mines at Bisbee, Arizona, now resolved on, is a great thing for that section of the country. These mines are very productive, and with railroad facilities for coke, supplies, and bullion, will do much better in the future.

The Comstock bullion production for the first quarter of the year, as figured up by the assessor, is very satisfactory, being ahead of the corresponding period of last year. It is, moreover, gradually but steadily increasing.

There is no news of moment from the Lower California gold-fields. An impression prevails that the excitement was one more or less connected with a sort of "land boom."

For the first quarter of this year the Comstock mines have produced about \$1,500,000. The average of 71,504 tons of ore was \$19.75.

## Bullion vs. Copper and Lead.

The practice that on this coast has come to obtain of including copper and lead in our annual product of bullion is one that ought to meet with early amendment, and that for a variety of reasons: In the first place, it is a contradiction in terms, bullion consisting of only uncoined gold or silver, neither copper nor lead can form any part of it. The statement that the country produced last year bullion to the value of \$104,000,000, of which \$20,000,000 was composed of copper and lead, is as if the Census Marshal should say California contains a population of 1,400,000 souls, divided as follows: 900,000 whites; 20,000 colored people; 160,000 horses; 5000 jackasses; 140,000 Chinamen and 175,000 sheep. Having included copper and lead in his schedule, wherefore does the bullion statistician leave out coal and chrome? For the reason we suppose that the census man might leave out from his enumeration the cats and dogs.

This practice, now so culpable and absurd, was in its inception simple and excusable enough, having originated in the early days of mining, when there was so little lead and copper produced that they did not require to be eliminated from the bullion product of the country. Gradually, as operations were extended to silver mining, the output of these base metals increased, having reached its present large proportions without any one protesting against these metals continuing to be accounted bullion for the reason seemingly that there was no one sufficiently interested to make a movement toward that end.

Although large quantities of copper ore were taken out at the Copperopolis mines in California between the years 1866-8, the product of these mines did not figure in the bullion returns of the State, having been shipped abroad in the form of ore. Meantime considerable lead began to be produced in this State; but it was parted from the silver and other metals with which it was combined and afterward sold as lead, never appearing here as bullion.

In most other sections of our mineral regions, however, a different rule has prevailed, the lead and copper produced to the amount of several hundred millions, having there been returned as bullion; to such large extent has this class of data been in error and so far as depended upon misleading. And this evil, if left to itself, instead of abating will increase with lapse of time, as the product of these metals throughout the above countries will be likely to undergo considerable increment hereafter. It looks now as if their value might be doubled within the next decade, increasing by this process of misnomer our bullion product in the same ratio.

As is well known, statistics of this kind can, with our best efforts, be made no more than approximately correct. What sense is there then in willfully introducing into them such an element of error as this? seeing it must greatly impair their value as the basis of any important estimates or calculations, legislative, fiscal, or otherwise. Assuming these returns to be accurate, or nearly so, the political economist, the publicist, and others having occasion to consult them, act accordingly. How worse than useless they become when out of the way to the extent of one-fourth the actual bullion production made must be obvious to all. How can any satisfactory conclusion be reached discussing the question of monometallism for instance, on the assumption that we produce annually a hundred million dollars worth of bullion when the product amounts to but eighty millions? The premises being unsound, the deductions made from them must be equally faulty.

Another objection to this method of computing the bullion product is that it works to the prejudice of California, Oregon and such other sections of the coast as make little or no lead or copper, their bullion consisting mainly of gold and silver—in other words, their bullion is bullion. In reporting it no attempt is made at exaggerating its value through any misstatement of facts or perversion of language. In the tabulated statements as they appear from year to year, California has of late been relegated to a secondary place as a bullion-producer, when as a matter of fact she is entitled to the first place.

If the value or quantity of mineral products made is, without reference to kind, to settle the question of supremacy in this respect, it must be awarded to Pennsylvania, which pro-

duces more coal, iron and petroleum than any other State in the Union. As a producer of the precious metals, however, California heads the list, having for the past few years been outranked through the process mentioned.

## Quicksilver and the Tariff.

We recently published the petition to Congress of the quicksilver miners of California, asking that body not to remove the duty on the article. American quicksilver is solely mined and manufactured in California, not being produced anywhere else on this continent. The present duty is 10 per cent ad valorem. The proposed changes in the tariff include it in the free list, against which the quicksilver producers protest.

It seems now that the Eastern manufacturers are trying to get quicksilver on the free list, while they at the same time keep their manufactures protected.

The following is a list of the articles manufactured from quicksilver in the East, but not in California:

Bisulphate of mercury, yellow.	
Cyanide " " green.	
Iodide " " red.	
Nitrate solution of mercury.	
Oxide " " black.	
Oxide " " yellow.	
Photo-bromide " " yellow.	
Sulphate " " black.	
Sulphuret " " with chalk.	
Mercurial ointment.	
Mercurial preparations.	
Vermilion.	

Duty  
25 per cent  
ad valorem.

Here are these Eastern manufacturers protected by a duty of 25 per cent ad valorem, trying to get a ten per cent duty taken off the substance which forms the base of their products. They must buy this base in order to make the product. They would sacrifice the quicksilver mining industry of this State to benefit themselves, regardless of the fact that our mines are owned by individual citizens, while the foreign mines are owned by Governments. The Austrian and Spanish quicksilver miners are paid very low wages, and the mines are so immense that they can largely increase production and flood our markets if they desire. They could put prices down so in a few years that our California mines would have to be closed down, and then, when they had a monopoly, they would advance prices so largely as to make up for the period of depression.

## Watching the Hydraulic Miners.

The supervisors of Yuba county are said to be considering the expediency of supplementing the present reward plan for the detection of illegal hydraulic mining by the employment of ten special detectives for that service.

Although the hydraulic mines that have been enjoined from running are quite numerous, the territory they occupy is not so extensive but what the sight of every one of them ought to be well known to most residents of Yuba county. We fancy we could, as we sit here writing, give the name and the locality of nearly every property that has been placed under the judicial ban.

A hydraulic mine, when in full operation, is rather a conspicuous and noisy object, being able to make itself seen and heard for a considerable distance. It cannot be run, as this proposition for the employment of so many detectives would seem to imply, in a secret and silent manner. Raising a great column of water on high, and dashing it with terrific force against a solid bank of earth 300 or 400 feet away, its operations can, under favorable circumstances, be seen and heard for the distance of a mile or more. When running, the whole neighborhood is advised of the fact.

Not only so, but the residents along the out-letting streams, for a long way below, know by the discoloration of the water that gravel-washing by this process is going on somewhere above. The moment the hydraulic miner commences his work, he advertises the fact to everybody below. Plot and scheme as he may, he cannot conceal what is going on. A hydraulic pipe and nozzle is a very different thing from the ordinary garden hose. It is larger and much more powerful. The dishonest miner cannot carry this apparatus into his cabin and run it there with impunity; nor, stowing it away under his bunk, can he take it out of a night and operate it safely under cover of dark-

ness. This never has, and never can be done. The thing is impracticable.

For our part, we supposed hydraulic gravel-washing had entirely ceased throughout the enjoined districts, having been led to such conclusion from announcements made in the Marysville and other valley papers to that effect. Repeatedly during the past year have we seen it stated in these papers that the water of the Yuba was at last running clear, and that the navigation of both the Sacramento and the Feather rivers has been greatly improved since the hydraulic mines were shut down. We are, therefore, not a little surprised now at this talk about employing so large a force to patrol the mines and report what is being done by the malcontents who were thought to have been so effectually stopped.

## Pioneer Mining Companies.

In the early days of mining in California, companies were formed to go to the gold-fields, which were very different from the companies formed for mining purposes now. Then the men were banded together for mutual protection and profit, and the individuals of the company went to work with pick, pan and shovel. Now the members of the company own stock and hire others to work the claim that they buy. There are thousands of people who own mining stock who never saw a mine and never want to. The pioneer companies were often formed in the East before starting for this State, others were organized on shipboard on the way here, and still others were not formed until the mines were reached. These pioneer organizations seldom had names such as modern corporations have. They were formed for no definite period, and it was a simple matter to dissolve partnership and "go it alone." They left no records, having kept none, and as few of them lasted any length of time, their histories have never been written.

Even to this day, however, inquiries are often made concerning these wandering parties of miners or of individuals connected with them. A letter received by the PRESS this week is in point, and is as follows:

EDITORS PRESS:—In the year 1851 a party of men left Philadelphia, Pa., for California; their object in view was gold mining in that State. The men reached California, and I received letters soon after from a relative who was among them, but through change of address received no more, and have not heard from him since. I would like to know his whereabouts, having lost his letters. I do not know what part of California the company made their destination, so I have no guide to search by. Could you possibly inform me where the company mined on reaching California, or if not, can you direct me to any person who is likely to know? Any information will be gratefully received. You will oblige me very much by sending an answer.

FRANK J. LINDHEIMER.

Cape May City, N. J., May 9th.

How our correspondent ever expected to get any information on the subject that interests him we do not know. He does not even give the name of the person of whom he inquires. He does not state what time of year the party left, or whether they came here by way of Panama, Cape Horn or across the plains, or even the name of any one of the number. This is a sample of one kind of letter sent to newspaper offices, and the writers wonder why they are not answered, although no return stamp is inclosed.

The letter is here published only to call attention to the vague inquiries now made concerning our pioneer miners. Few persons in the East have any idea of the magnitude of the State of California. Its area is 156,591 square miles, or 100,218,560 acres, or if we count the rivers and creeks, lakes, ocean shore-line, etc., the true area is 162,197 square miles. The State is about 750 miles long, and an average of 240 miles wide. Gold mining is carried on at the extreme north and at the extreme south and at various places between these points. In the early days the mining-field was mainly in Central and Northern California, but even then the field was large. "Looking for a needle in a haystack" is a small task compared to hunting up and tracing out, at this day, the history of the companies of pioneer miners who dug for gold in "the days of '49."

THE Silver State is informed that a new company has been organized to work the Cottonwood nickel and cobalt mines. Reduction works are to be built on the ground, and representatives of the company were expected at Lovelock yesterday to go to the mines to commence work.

### Hydraulic Gravel Elevators.

Perhaps no other mining appliance is now attracting so much attention in this State as the hydraulic gravel elevator. Before the general stoppage of hydraulic mining, the use of this machine was mainly confined to "low ground," and was used to lift gravel to a point where fall could be obtained to carry off the washed material. When, however, miners could no longer operate their gravel claims by the method formerly employed, the elevator was brought to notice as an appliance by which the claims could be worked. Since then it has been introduced in many places. By its use the gravel can be elevated and the debris carried into old workings, pits or valleys, so that the heavy material will be prevented from going with the rivers or creeks, and making the claim-owner liable to injunction. When the machine was first introduced, there were doubts as to its efficiency, and it was thought to be adapted only to very low lifts. It has since been made to elevate the gravel as high as 80 feet. It was thought, also, that it would rapidly wear out and be expensive to maintain.

We print an extract from a letter, giving some facts in this connection which will be of interest to owners of gravel claims. It was written to the manufacturers of the elevators by R. H. Campbell of Etna, Siskiyou county, and is as follows:

"I am glad to inform you that I am greatly pleased with the hydraulic gravel elevator furnished for my use by you in October, 1886. It has been running day and night since the 10th day of February of this year, with only a few stoppages of less than a day at a time, which were not due to any fault of the elevator.

"There has not been one dollar's expense or breakage to it, and the wear seems to be of no consequence. My foreman says the throat will last another season, but if one throat will last one season's run of four or five months, I shall be perfectly satisfied. I expect to run with a full head for a month or six weeks yet, when I propose to lower the elevator 14 or 15 feet, making in all a raise of 40 feet, under a pressure of 240 feet, with a volume of 1000 miner's inches of water conducted through a 22-inch pipe laid straight down the hill to the elevator."

The No. 3 20-inch hydraulic gravel elevator referred to above was purchased from the Joshua Hendy machine works in this city in October, 1886, by Mr. R. H. Campbell, manager of the Quartz Valley Mining and Stook Raising Co., owners of an extensive and valuable hydraulic placer-mining property, situated near Etna, Siskiyou county, this State. The elevator was placed in position and operation in April, 1887, and at the close of the mining season of that year Mr. Campbell wrote to the manufacturers "that it had performed all of the work required of it, and that the wear of its parts was simply nominal."

The favorable report presented by Mr. Campbell of the operations of the elevator thus far in this season confirms that of last year, and is worthy the attention of mining men who are or contemplate becoming interested in hydraulic mining enterprises by the method known as the hydraulic gravel elevator system.

As many persons have claimed where this elevator may be used, there may be some who are not familiar with its details of construction. The cut on this page is a sectional view of an elevator in operation.

The open end of the ground section is concave in shape, or there is a lower half-section of pipe flaring outward, into which the earth, sand, gravel, etc., are sluiced by hydraulic giants through bedrock flumes leading thereto. The elevator entrance and throat sections are set in a chamber excavated below the bedrock surface.

The material sluiced into this entrance is

taken up by the steam issuing from the fixed hydraulic nozzle, which, by its impinging force, impels it forward and upward through the pipe to its point of discharge in the open frame above, whence it is carried away through a line of sluice-boxes to a final dump.

Confined as the material is, within this tight iron pipe, it is necessarily impelled forward with the velocity of the steam itself, and as each particle of gravel or other material is directly acted upon by the full force of the steam discharged through the hydraulic nozzle, it is considerably disintegrated by this action, as well as by the friction along the pipe in its ascent, and the pulverization is so complete that long and expensive outer flumes or lines of sluice-boxes are rendered unnecessary.

It will be understood that the character of the gravel deposits whether good piping ground, or hard, compact conglomerate formations, governs the size of the hydraulic giants to be used, and consequently the quantity of water requisite for piping purposes. It must also be remembered that the greater the pressure of the water at command, the larger the quantity of earth, gravel, sand, etc., that can be raised through the elevators, and, consequently, that the dimensions of the outer flume or line of sluice-boxes must necessarily be proportionately increased for such greater

### Congress of Anthropology.

The first International Congress of Anthropology ever held in this country will convene at Columbia college, New York, June 4th to 7th inclusive. It will be in the direction of an investigation of man himself, a discussion of his place in the scheme of nature, an examination into the underlying laws of his mental growth, and a description of the variety of the species, their characteristics, their locations and their relationships. These are the topics which will be discussed in the sections of Anthropology, Ethnology and Ethnography.

The section of prehistoric archaeology will take up the study and discussion of the relics of human activity which have been preserved and found, beginning with the appearance of man on the globe. A discussion of the topic of prehistoric archaeology reveals the earliest condition of the race, and the germs of those arts and sciences which in later generations continued in ever-increasing development. It shows the complex fabrics of later social conditions in their simple original forms, and thus facilitates their analysis. It brings out in strong contrast the very slow progress of man in early times, and in his lower conditions, compared with more cultivated epochs. It furnishes a valuable key to the events of history

the "Prehistoric Archaeology of the Western Hemisphere" the date of the discovery by Columbus separates the historic from the prehistoric or American annals. Under this title comes the Paleolithic period, paleolithic period in North America, in South America, Neolithic period, archaeology of the area of the United States, archaeology of the area of Mexico and Central America, archaeology of the Andean nations, and archaeology of the areas of Southern and Eastern South America and the West Indies.

To avoid confusion and to insure uniformity by the writers of papers to be read in the section of Archaeology, in the employment of terms by which the later geologic epochs are designated, it is understood that the division of the geologic record as applied to the history of man be as follows, viz.:

The rocky strata which make up the earth's crust divided into Primary, Secondary and Tertiary strata.

The Tertiary age or epoch, subdivided into three minor ages, the Eocene, the oldest; the Miocene, and the Pliocene, the latest.

After this is placed the Quaternary epoch, called by some the Pleistocene, synonymous terms designating the period intervening between the close of the Tertiary epoch and the beginning of the Geologic age in which we live,

this being known as the alluvial or actual age. This Congress will therefore consider, in their use of terms, the Tertiary to embrace the Eocene, Miocene and Pliocene, and to terminate with the latter. The terms Pleistocene, Post-Pliocene and Diluvial will be considered as synonymous with Quaternary. The terms alluvial or recent deposits will be reserved for expressing those which may be considered as still in the process of formation. The Glacial epoch at or near the close of the Tertiary period marks the probable first appearance of man, as it is in the strata of this age that we find the first unequivocal traces of his presence.

For any additional information, inquiries may be addressed to Dr. Edward C. Mann, President New York Academy of Anthropology, 128 Park Place, Brooklyn, N. Y. The foreign membership of the New York Academy of Anthropologists of the world.

### Mechanics' Institute Fair.

At a meeting of the Trustees of the Mechanics' Institute, held last Tuesday night, many letters were read from county officials in different parts of the State, saying that their counties intend to make exhibits at the forthcoming exposition, and asking about space, freight rates, etc. Trustees Stump, Bassett and Hoppe were appointed a committee to obtain information regarding freights and special rates for the benefit of intending exhibitors.

It is understood that on all branches of the S. P. in the State, perishable articles intended for the fair will be carried free, and non-perishable returned free.

In view of the fact that a larger number of county exhibits may be looked for this year than ever before, General Agent Stout recommends the removal of the Union hotel on Hayes street, and the erection in its place of a middle annex to the pavilion as increased room is needed. The matter is under advisement.

At the station of Fountain, Colorado, some freight cars which had broken loose from a train collided with a passenger train standing at the station. A car full of naphtha was ignited, and in turn 17,000 pounds of dynamite on another car were exploded. Five persons were killed and 25 injured. The damage to the town is \$60,000, and to the railroad company double that amount.

SECTIONAL VIEW OF HYDRAULIC ELEVATOR

pressure, and a larger volume of water be required for the proper washing of the material discharged through the elevator upraise pipe into the outer flume or line of sluice-boxes.

In the sectional cut, the following are the names of the improved parts of the form of "Hendy" hydraulic gravel elevators: Section No. 1, water-pipe flange; No. 2, half-elbow; 3, 4 and 5, hall joint; 6, hydraulic hntt; 8, nozzle; 9, elevator ground section; 10, elevator-entrance section; 11, elevator throat section; 12, elevator outer section; 13, outer pipe flange; 14, elevator upraise pipe. The numbers of elevators are governed by the diameters of these respective upraise or discharge pipes. No. 1 elevator has 12-inch diameter, upraise pipe; No. 2 has 16-inch, and No. 3 has 20 inch pipe.

NEWS has been received from Bisbee that at a meeting of the officials of the Copper Queen Mining Co., the route of a new railroad from Fairbank to Bisbee, a distance of about 40 miles, was decided upon, and the work will soon be commenced. This will connect one of the leading copper mines of the country by rail with the outside world, and is considered a great boon to the Territory of Arizona.

ORE that assays £2200 to the ton has been reported from the Marototo district in New Zealand. There is wild speculation in silver mining stocks in Sydney, Melbourne and Adelaide. There is great activity in Newcastle owing to large shipments of coal to San Francisco.

THE Central Nevada warns miners that there is no demand for them in that part of Lander county.

by revealing the causes of this important change.

Under the head of the "History of Culture," will come a discussion of the moral, intellectual, social and politico-economical, as well as political developments of nations of antiquity, of the Middle Ages and of modern times. In short, this Congress will have for its objects the study and discussion of General Anthropology in a strictly scientific manner, and will discuss man in all his leading aspects, physical, mental and historical.

In the section of Ethnology the topics discussed will aim to explain, as those in the section of Ethnography will aim to describe or depict, the physical condition, stage of culture, and the social life of the various tribes of men with the final aim of interpreting, in a comparison of such facts, the universal laws of progress of the human species. Among the topics are: food supply, sexual relation, language, technology, government and laws, religion and civilization, as the result of ethnic development.

Under Ethnography will be discussed the Oceanic peoples, the Americans, Mongolian, the Dravidian peoples, the Arabic-African race and the Indo-Europeans.

The object of Prehistoric Archaeology is to restore the history of the race during those periods for which we have no written records, and to throw new light on the relations which the species of man bear to other animals, lower in the scale of zoological life, and to illustrate the laws of his evolution, physical and mental.

Under the sub-title of "Prehistoric Archaeology of the Eastern Hemisphere" will be considered the ages of Stone, Bronze and Iron, and prehistoric art in Europe. In considering

## MECHANICAL PROGRESS.

## A Few Rules for Lubricants.

1. To secure the highest possible efficiency of machinery and maximum economy in the operation of establishments in which it is employed, lubricants must be very carefully selected with reference to the precise conditions as to pressure and velocity of rubbing met with in the individual case. Where, as in machine-shops and mills, for example, there exist great differences in these respects, it will be found best to use different oils, as heavy oils on the engine bearings, special cylinder oils in the steam cylinder, lighter oils on the shafting, and the lightest of the better class of lubricating oils on light machinery, as on spindles.

2. Differences in price of oils or other lubricants are usually of exceedingly slight importance in comparison with differences in costs of power, and the value of the coefficient of friction is therefore of vastly greater consequence than either the price of the lubricant or its endurance.

3. The best oils for specified purposes should be taken as a rule, whatever their market price; while the oils which are not well adapted to the purpose in view cannot be economically purchased at any price. It will often be found that the best quality of oil is not necessarily the best oil for any one specified purpose. An oil may be intrinsically excellent, and may be a very expensive oil, but may, nevertheless, be absolutely worthless for the purpose in view.

4. The cost of using a lubricant which is not well adapted to the work is so great that nuggets should always be tested, and their adaptability to the special case determined by a correct system of chemical and physical tests, and by trial upon a good testing machine, if possible, under the exact conditions of the intended use. The determination of the quality of any lubricant is an easy task; but the identification of the real conditions of use, as proposed, may sometimes be difficult. Where journals are kept in good order and are properly proportioned, no difficulty need ever arise in the attempt to find the best possible lubricant for them. As a rule, there is no excuse for a condition of machinery which gives rise to such uncertainties. Testing machines are now made in sufficient variety of form and of ample range of application, and of such satisfactory accuracy that there is no longer necessity of accepting the risks, and of meeting the enormous expense involved in the application of lubricants of unknown quality to valuable machinery.

5. Where lubricants of the precise quality desired are not found in the market, it is advisable to secure the right grade by mixing. This can always be done by making a series of mixtures of good oils, such that, at the one side, the gravity and other qualities shall be too high, and on the other side too low for the special application had in view, and thus working out after determining by trial the law of variation, the mixture must prove suited to the purpose. By this method the quality of the oil has sometimes been improved for a special kind of work more than 100 per cent. Satisfactory results can almost invariably be obtained by careful and skillful work.

## The March of Invention.

"The Growth of Manufacture in the United States" was the subject of a lecture recently delivered before the Franklin Institute in Philadelphia, by Edward Atkinson of Boston. The lecturer dealt not so much with statistics as he did with great social questions, and the increase of the production of cotton goods during the last decade was not dwelt upon to the same extent as the question whether the growth of manufactures did not tend to dwarf the mental powers of a great portion of the people.

In his opening remarks Mr. Atkinson said the question to be solved was whether the increase of wealth is really a gain for the country. "I believe," he said, "that man has been endowed with progressive talents, and that the struggle for life has a loftier end than the maintenance of mere human existence. It would be easy to make statements taken from the census reports showing the great amount of capital invested in the United States, but these figures in the census are not worth the paper they are written on. They are delusions, mere inferences. Even if such data were accurate, what would it be worth a year hence, with the constant introduction of new inventions? It is a rule that every new invention produces the same product on a capital less than was invested before." Mr. Atkinson spoke of machines called slashers used in cotton manufacture, and stated that he visited a mill several years ago and found eight men running the machinery, then valued at \$10,000. Recently he visited the same mill and found an improved machine, valued at \$3000, doing the same work as the \$10,000 apparatus and only requiring one man to run it.

Invention, he said, was the destroyer of capital. He referred to the great farms of the West, and showed that in 1874 the big reapers were followed by seven or eight men to bind the grain, while two years later each reaper had a self-binder attached to it. On the farms, with wages at \$25 a month and board for permanent employees, wheat is made for 40 cents a bushel, while in Rhenish Prussia, with wages at \$4 a month, it costs 80 cents a bushel.

The low-priced wheat of this country feeds the people of England. Except for these inventions we could not sell our wheat so advantageously. The lecturer explained that it was in the intervals between these ebbs and flows of progress that people suffered most from want. When new inventions, universally used, throw thousands out of employment for awhile, in each case capital tended to become less and less in proportion to the product.

The growing difference between the wages of skilled and unskilled labor and the good and ill effects of the introduction of the manufacturing system was touched upon. The germ of the woolen factory was in the fulling-mill, the cotton factory originated in the cotton gin. Before the war the most pernicious effects of the slavery system was upon the poor whites of the South who owned no slaves and were brought up in ignorance. Since the war, however, iron, steel and wood-working—in fact, all the arts of peace have all been introduced in the South.

The development of the railroad lowered the value of land in the East and increased it in the West. Continuing, Mr. Atkinson said: "If we take capital invested as given in the last census for any one branch, and add 20 per cent to bring it up to the present value, we will not find a single branch in which the capital invested equals one year's expenditure for railroads. Here we have a manufacture of the most important kind that is not included under that title. There is no better standard by which the prosperity of a country may be measured than by its consumption of iron and steel. During 1887 the consumption in this country of 9,000,000 tons of iron exceeded the production of all the iron mines of Great Britain."

The woolen manufacture, the lecturer said, was still an infant industry.

## Rolling and Forging Iron.

It is said that the reduction of iron in the process of rolling is facilitated by changing the shape of its cross-section from one simple form to another at each pass; as from square to oval, oval to round, or feathered to square; the object being to leave it, from each groove, in such shape as shall best fit it in passing through the next, to extend greatly in length and little in width. While, therefore, it is apparently being distorted from the form which it is finally to assume, it is really being modeled in the shape which is calculated to produce that form in the most direct manner. Something analogous to this is met with in forging, where things are to be made in such shapes as make it difficult to hock the stock into each part in the proper proportions. In such cases, it is sometimes expedient to block out the piece with the principal object in view of distributing the stock in the different parts, in approximate proportions, purposely leaving, for the finishing operations, the work of getting it into the required shape.

Gun-triggers were formerly made by taking advantage of this method. They were almost universally forged by hand, until 1859-60, but have since been made much easier with the drop. The finger-piece of the trigger is broadened to give a good hold, while the part that goes up through the guard is quite thin. The process of making them formerly was to take a piece of flat iron, turn it edgewise and hammer the end down, on the inside corner of the anvil, and then put it into a stake, set in a cow-block, and hammer it into an impression there, which gauged the amount of stock left in the finger-piece, and thinned down the back. The stock for the finger-piece was all on one side, and, although this did not look much like a trigger, the stock was there in the right proportions.

The thin part was then put into a slot and two or three blows struck on the finger-piece to draw it over into the middle, after which it was put into jumper-dies, and these finished it in a very smooth and perfect manner full as nicely as they are now made.—*American Machinist*.

A MAMMOTH STEAM BOILER.—The Parkinson Manufacturing Co. of Saranton has just completed the largest boiler ever constructed in America. It is to be used in the Calumet and Hecla copper mines of Michigan. The boiler is 35 feet 4 inches in length, 10 feet 6 inches wide and 11 feet 6 inches high. It would require one man 2200 days to build the boiler. It weighs 45 tons and is of 1000-horse power. The boiler is made of steel from the Otis Steel Works at Cleveland. One sheet used weighed two tons. The steel from the "crown sheet" to the "wagon top" is 1½ inches in diameter, that near the valve is three-fourths of an inch, and the other parts nine-sixteenths of an inch in diameter. There are 198 three-inch tubes in the boiler, a double firebox connecting with the flues, and stay-bolts and rivets are used, varying in length from six inches to ten inches. There are 30 "band holes" for the purpose of cleaning the boiler, which may serve to illustrate its immense size.

IMPROVEMENT IN SPEED OF ELECTRICAL TRANSMISSION.—When the first electric telegraph was established the speed of transmission was from four to five words a minute with the five-needle instrument. In 1849 the average rate for newspaper messages was 17 words a minute. The present pace of the electric telegraph between London and Dublin, where the Wheatstone instrument is employed, reaches 462 words; and thus what was regarded as miraculous 60 years ago has multiplied a hundred-fold in half a century.

## SCIENTIFIC PROGRESS.

## The Development of Speech.

## The Gradual Process of Civilized Speech from Instinctive Verbal Sound.

Exceedingly interesting is the process of language development in a babe. No study in anthropology is more fertile. The babe's first cries are purely instinctive, and therefore purely animal. Its consonants are m and b, labials and liquids—used with the open vowels. It does not use the genial tubercle, nor for many weeks the frontal brain. Its second lists of sounds move further back and are g, goo, gutturals of the simplest sort. This g sound, with its natural associate, l, becomes the well-known basis of all primitive languages—the clicking or glicking of Ainos and Hottentots.

Next observe the babe as it watches your mouth and laughs at your cooing and your baby talk. It finally sets its own articulating organs in motion and imitates you. The consequence soon is the simple use of the frontal brain and the genial tubercle. The goo goo is followed by eh eh and obe che, and soon after by modulation. These are not only the first use of truly human organs, but the first cerebral sounds, as distinct from instinctive and inherited utterances. The steps toward a highly complex cerebral language are thereafter rapidly taken.

We have to bear in mind that the babe organically follows historic evolution and is an epitome of past progress. So also in his speech he moves on and over the pathway of the past and reviews it all. An intelligent child expresses approbation by the same sounds that are used by adult monkeys. The savage hardly uses cerebral sounds at all. The refinement of languages has ever consisted in eliminating the animal inheritance. The child's use of gestures is his hands; only to secure muscular strength to direct them. His play is at first purely animal frolic, rejoicing in shouts and shrieks that later he does not find necessary to his enjoyment. His laughing and crying can be understood as language, as they surely are also in adults.—*Popular Science*.

CURIOSITIES OF MAGNETISM.—Most well-informed people are doubtless aware that the globe on which they live is a great hall of magnetism, but comparatively few have an adequate idea of the influence this property is continually exerting on all sides, that many common but inexplicable phenomena can be traced directly to this source. Statistics go to show that in the matter of steel rails, as many as 13 will become crystallized and break where they go to make up a railroad track running east and west, before one of those on a north and south track is similarly affected. This is entirely due to the magnetism generated by friction, and the fact that the polarity of the magnetic current is, in the former instance, resisted in the headlong rush of the train, whereas in the latter case it is undisturbed. Another strange effect of this peculiar and occult force is that exerted on the watches of trainmen. A timepiece carried by the conductor running a train 20 miles an hour, however accurate it may be, will, if the speed of the train is increased to, say 50 miles, become useless until regulated. The magnetism generated by the flight of a train may be said to be in proportion to the speed with which it is propelled, and the delicate parts of a watch, numbering all the way from 400 to 1000 pieces, and peculiarly susceptible to this influence by reason of the hammering and polishing they have received, are not slow to feel the effect.

MORE AND MORE WITH THE FACTS OF SCIENCE.—The facts of science are coming nearer and nearer to the general interests of mankind. Science is already installed as an important factor in almost every line of industry. It is an indispensable requisite in almost every workshop. It is the handmaid of the engineer, the mechanic, the tradesman and the agriculturist everywhere. Nearly all the journals of the day devote more or less space to its consideration in such relations. Our leading magazines are keeping abreast of the affairs which interest all thinking, progressive people. Our industrial engineers are recognizing and dealing with the facts which are constantly coming to light in these days of practical research into the hidden mysteries of nature. Science is constantly opening up new industries and new modes of conducting old ones. It is the essential medium through which nearly all progress in the modern march of improvement is made possible.

ENGRAVING BY GUNPOWDER.—Shooting a candle through a two-inch plank without disturbing it in the least is being outdone by dynamite, which is so quick in its action that a green leaf can be compressed into the hardest steel before it has time to flatten. One of the experiments at the United States torpedo-works was to place some leaves between two heavy flat pieces of iron, set them on a firm foundation, and see what gun cotton would do in forcing the iron pieces together. A charge was placed upon them by compressing the gun cotton into a cylindrical form about one inch thick and three or four inches in diameter, through the center of which a hole is made for a cap of fulminate of mercury, by which the gun cotton is exploded. The reaction was so great, from just being exploded in the open air, that one of the iron pieces was driven down

upon the other quick enough to catch an impression of the leaves before they could escape. It is a singular fact that the block of gun cotton itself should sink deep into the iron when it explodes, showing the prints of the letters that have been stamped into the cartridge, and still more so when we find that the letters sunk into the block of explosive material are not left raised on the iron, as they would be if pressed slowly into a piece of wax, but just the reverse, a depression in the cylinder of gun cotton forming a corresponding depression in the iron. This would seem to indicate that the particles of gas, as they generate, require time to get underway to penetrate far into a solid, and gives them a chance to store up a little energy by having a short space to act through.

AN AIR PUMP COMPRESSES AIR HIGHER THAN THE STEAM DRIVING IT.—Lately, says an exchange, some have been discussing the question whether a Westinghouse Standard air pump, which has the pistons in the steam and air cylinders of exactly the same size, can pump a greater pressure of air than the steam that is driving the pump. At first sight this appears to be a paradox, but it is certain that it is often accomplished, and the operation can be easily explained. At the beginning of the stroke, the piston receives a full pressure of steam, but there is little pressure behind the air piston to offer resistance. The consequence is that a certain velocity is imparted to the piston, and before the end of the stroke is reached there is the momentum of the pistons besides the full steam pressure available for doing the work of compressing the air. For instance, the pistons and the rod weigh say 15 pounds, and before the end of the stroke is reached they move at the rate of ten feet per second. This mass of moving metal possesses energy for doing work in proportion to the speed plus the weight, and is sometimes, in practice, converted into the work of compressing the air above the pressure of the steam that is driving the piston.

CUTTING DIAMONDS.—Some idea of the slowness of the work of cutting diamonds and the power required may be inferred from the following account of the cutting of one of these gems: This diamond was made up of a multiplicity of "twinings," and was of the character called *extreme durate* by the French. It had been cut into the rude form of a brilliant, and its table had been placed on a diamond polishing wheel for 100 days. The average circumference of that part of the wheel on which it was placed being about 2½ feet and the wheel going at the rate of 2800 revolutions per minute, the surface that traveled over the diamond table amounted to over 75,000 miles. At times 4 and 8 pounds were added to the usual 2½ to 3½ pounds of the clamp or holder, and for a time 40 p under extra were added, this last causing the wheel to throw out scintillations for several feet. The diamond fairly plowed the wheel, practically ruining it, so that it required planing before it could be further used. No polish was produced, however, sufficient to give the brilliancy necessary in any diamond gem.

THE GEOLOGICAL MAP OF EUROPE, which has been for some time in progress of construction under the auspices of the International Geological Congress, is nearly complete and will soon be issued to subscribers. As almost all, if not all, the leading institutions of learning and of research in the country are subscribers to this map, it is time for those who desire to avail themselves of the opportunities of securing it, at 20 per cent less than its market price, and before it is sold to the general public, to send their names in to Dr. Persifer Frazer, Secretary American Committee, 201 South Fifth street, Philadelphia. The cost of the map to institutions will be \$21, and to individuals \$26, the difference being the duty, which to the former class is not chargeable. No money contribution is required until the map is issued, which will probably be not before next fall or winter.

FIRE DAMP AS FUEL.—Natural or coal mine gas is at present being utilized for fuel purposes in England. All the gas heretofore known as fire damp is brought under the steam boilers at several coal mines. The machinery used and the process by which the gas can be used are the inventions of Arthur Shipley, a civil engineer. The Tyne colliery in England saves \$15,000 a year in labor alone by the use of this fuel. This fuel can be used in all parts of the mine to generate steam, and will reduce the cost of labor in coal mines to a wonderful extent. Shipley is in Pittsburgh conferring with Westinghouse relative to his patent.

A NON-SPEAKING TELEPHONE is exhibited in Pittsburgh. A sensitive plate presses against the larynx and glands of the neck, and as the jaws are moved in conversation the motion sends the words along the wire as distinctly as the telephone now in use.

CARBONITE, the flameless explosive that has been found safe even in an atmosphere of fire-damp, is manufactured by Schmidt & Bichel, at Schlehenhof, Westphalia, Germany, but arrangements are being made in England also for its manufacture.

ELECTRICAL EMPLOYMENT.—A low estimate puts the number of persons supported by all the forms of employment furnished by electricity at 5,000,000.

## GOOD HEALTH.

## For Fat People.

Intemperance in diet, indulgence in the excessive use of alcoholic drinks, too little bodily exercise in the open air—these are the more important of the causes which bring on corpulence, says a recent writer. As muscular exercise increases the production of flesh, inaction leads to an excessive deposit of fat. Alcohol acts in a manner precisely similar to that of fats, sugars and starches. It interferes with the destruction or combustion of the fat-producing materials, prevents them from undergoing combustion, as it is more easily destroyed by oxygen than they are. Certain diseases, such as any interference with the formation and development of the red blood corpuscles, the oxygen carriers, increase the disposition to the deposit of fat. The oxygen may enter the lungs, but without these carriers it is unable to reach the tissues where combustion ordinarily takes place.

The dangers of corpulence are many fold. All diseases accompanied by high fever are apt to follow an unusually malignant course in fat persons. The heat developed in these affections cannot be so readily lost by radiation or conduction as in the lean. The cold bath, the cold pack, and all forms of cooling measures fail to really reduce the temperature, and the fever is, in itself, a serious source of danger. The skin is constantly bathed in perspiration on slight exertion or when the external temperature rises. Hence, skin diseases are common and often intensely annoying among the corpulent. The breathing is interfered with by the accumulated fat, so breathlessness on exertion is common among them. The frequency of perspiration leaves the surface exposed to chilling influences which cause coughs, colic, bronchitis and pneumonia. The overloading of the heart with fat interferes with its action, so that palpitations and sudden faintness from partial failure of this organ to do its duty are not infrequent. The extra weight that has to be carried entails muscular exhaustion on exertion, such as is not felt by the thin person. The discomforts and dangers of obesity would fill a much larger catalogue, but it is not necessary to enumerate them all here.

The treatment of corpulence must vary with the cause. No rigid rules can be framed that will serve in all cases. If there is a strong hereditary tendency to it, a radical cure cannot be expected—only an improvement can be promised, and even this cannot always be secured. The prevention of it should be undertaken when a young person shows a strong tendency to put on an excessive amount of adipose tissue. One of the first things to be done in this direction is to regulate the diet. Immoderate indulgence at the table must be rigidly forbidden, yet the food must be in sufficient amount to secure all that the body requires for its needs. No starvation should be countenanced. Fatal weakness of the heart or permanent disorder of the digestion often results from irrational restrictions of diet. The temporary thinning is usually followed by a marked increase in the corpulence beyond what existed before the "Tanner plan" was adopted. A much better plan is to avoid exciting the appetite by too great variety of food. Prince Bismarck's physician succeeded in curing his patient by the very simple plan of making the meal consist of only one kind of food, of which he should eat as much as he pleased, and no drink of any kind to be taken at meals or until two hours afterward. By this means no unnatural appetite was encouraged, and the patient ate only what the necessities of the system really demanded. The diet should contain an abundance of albumen, little fat, and still less starch or sugar, when an earnest effort is being made to reduce corpulence or provide against its making its appearance. Some fats have to be taken, or the albuminous foods will not be digested or appropriated by the system. If signs of disordered digestion appear, the diet must be modified from time to time by the addition of articles which are usually forbidden. It is better to incur some of the prospective discomforts or even dangers of obesity than to ruin the digestion in the attempt to avoid them.

## A Substitute for Cocaine.

The *Pacific Record of Medicine and Surgery* describe on authority of a German publication a new local anæsthetic of surprising power and rapidity, viz., hayah or erythrolein. Its intensity, says the doctor, is *uberrischend*, and it is destined not merely to supplant, but to quite overthrow and destroy, the reputation of cocaine. It is of African origin, and is found in the shape of a red mass called hayah. A minute portion placed upon the tongue renders the organ utterly devoid of the sense of taste or even of sensation. Chemically, it is a glucoside. A drop or two of an aqueous solution placed in the eye of a cat renders the organ absolutely insensible in 15 or 20 minutes, and it is more or less anesthetized from 10 to 24 hours afterward. Inwardly or subcutaneously injected, it renders frogs and such animals inert, the frequency of heart-beat is lessened from 33 down to 8 beats per minute, and a spasm or cramp, beginning at the eyes, passes over the entire body every few moments, extending to the very end of the tail. In animals that vomit this reflex occurs within a few moments after injection. The source of this wonderful medicament is said to be a plant

described by Oertel in the early part of this century under the name of erythrolein judiciale, the substance being used in the native African trials by ordeal. In these trials the bark of the plant is powdered and mixed with water and given to the accused to drink. If vomiting follows immediately the accused is held to be guiltless, but if he fails to vomit the contrary was held, and he was immediately clubbed or stoned to death. The Berlin Museum possesses the material originally sent to it by Oertel, and recent experiments with it develop the fact that the material now sent from Africa under the name "hayah" is an extract of the same, and the active principle obtained from both is identical. The *Record* adds: "We await further developments with great interest."

**A SIMPLE HEALTH SUGGESTION.**—Sleeping-rooms should have a plentiful supply of pure air, which is best obtained by opening windows. "But night air is not wholesome this damp weather," said a gentleman, lately. "My dear sir, what other kind of air is there in the night but night air?" was the reply. After a winter's depression of vital tone, and especially after exposure to Arctic blizzards, a plentiful supply of oxygen is doubly necessary, and there should be no hindrance to free circulation of air while voluntary life is still. If every one would take half a dozen deep inhalations twice or three times daily, beginning with the arms hanging down and an empty chest, and gradually raising the arms until when the lungs are full they are stretched directly upward, there would soon develop a sturdy power of resistance to cold that would add much to our comfort.

**REMEDY FOR POISON OAK—DON'T EAT THE LEAVES.**—A correspondent of the *Morning Call*, who has suffered terribly from poison oak, was cured in a few days by using as a wash a decoction of wormwood leaves, made quite strong. The weed grows abundantly where poison oak abounds, so we find the poison and its remedy growing side by side. The correspondent further adds: "I hope no one will try that foolish idea of eating the leaves, for I should have tried it myself had I not seen a child, whose parent made it eat some, suffering in great agony, and narrowly escaping death."

**REMOVING MOLES.**—The fair sex owes still another debt to the scientist. A lady who had a mole on her shoulder and who, from this reason, was unable to display her otherwise fair and attractive corporeal possessions, has had an electrical operation performed with perfect success. The mole was perforated with electric needles in every direction. After a week the mole, which had been burnt to a black mass, fell off and left the skin in good condition. The new skin showed hardly a trace of discoloration, and she now wears the most fashionable hall-dresses with impunity and success.

## USEFUL INFORMATION.

**CUTTINGS FOR FLOWERS.**—With the encephale and flowers of May, and the general awakening of vegetable life, comes the season for rooting cuttings of flowers which girls love to grow and enjoy. They need, for cuttings of all soft herbaceous sorts of greenhouse flowers, only a saucer of water full of clean sand and the sunny window of a warm room in which to set it. The sand serves to hold the little cuttings in place and erect, with the leaves above water. The best cuttings are the young, tender ends of the new growth just starting on the old plants kept over winter. Cuttings an inch long or less, with two to four leaves, set at once in the warmed sand and water, seem to forget their severance and go on expanding upward and sending out roots downward with charming goodwill. Try with some fresh tips of verbenas, colsenes, double petunias, scarlet sage or any other such soft-wooded plants. Put them into water at once and keep warm so that they may not wilt in the least, and the result will be delightful in itself and a most pleasingly useful occupation of time and thought. When roots have formed half an inch long or more, the little plants should be put each into a separate little pot of soil. Paper pots of tough material answer well.

**CASTOR OIL AS A LUBRICANT.**—A correspondent of the *English Mechanic* writes as follows in a recent issue: "The Asiatic wire-drawers have very long ago used this oil in preference to any other kind. Their dexterity is surprising, the wire for the Trichinopoly chains of gold and silver being like hair, and every good workman draws his own. A man made me a plate for the fine gauges from a flat rasp of English steel, which I still possess. He drew copper, zinc and brass equally well. This oil, being one of the cheapest in India, is used to soften harsh leather shoes and ropes. The fresh leaves of the castor-oil tree, too, are gathered, bruised and rubbed in the hand, then stuffed tightly into stiff European boots, male or female, and so remain all night; the leather then becomes quite supple. For feeding large drills I like this oil mixed with soft soap."

**A NEW HECTOGRAPH** of German invention is made from a sheet of blotting-paper which has been soaked in a solution consisting of four parts of gum, five of pure water, three of am-

monia, three of sugar and eight of glycerine. The gum is first dissolved in a mixture of the water and ammonia, which is then heated to boiling and the sugar and glycerine added. The hot solution is then spread over the paper with a brush and left to dry during a period of three days. When used, the paper should be dampened with a sponge and left one or two minutes. The drawing or writing to be copied is placed over the copying-paper, face downward, and pressed with a roller or the hands. After one minute it is taken away and a sheet of paper substituted, on which the drawing is copied by simple pressure with the hands, as previously described. Several copies can be obtained from an original, and the same copying paper can be used for reproducing other drawings after a period of 24 hours.

**MATHEMATICS AND ARITHMETIC.**—Like most ordinary mortals, mathematicians are inclined to shirk dealing with figures. Even Newton, the great master of the most abstruse calculations, could not, we are told, cast up a sum in addition; and the works of M. Stas, said to have had never an equal in exactitude, have been found to contain an astonishing number of arithmetical slips. Prof. Huxley has given the weight of air on a square mile as about 590,129,971,200 pounds, containing not less than 3,081,870,100 pounds of carbonic acid, in which is 371,475 tons of carbon. The real quantities, as figured by Sydney Lupton, are 59,133,431,808 pounds of air, 31,464,399 pounds of carbonic acid, and 375,227 tons of carbon. Another writer has proven the water under a westerly equatorial current to be 12 per cent higher than under an easterly equatorial current, this false result being based on an arithmetical error.

**THE DECIMAL MONEY QUESTION IN ENGLAND.** The decimal system of money is a question that at present is receiving considerable attention in England. In this, as in some other things, England is just a century behind the United States. For a few years past there has also been an awakening on this subject of Protection (or Fair Trade, as it is called over there) and in the course of 90 or 100 years we may expect the English Government to adopt the "American system." Then our manufacturers of steel rails, locomotives, cloths, etc., will have to pay duties on their shipments to that country, and the English people will wonder how their ancestors could have been so stupid as to follow the ignis fatuus of Free Trade for so long a time. They will, of course, attribute it to their progenitors' slow ways, and will not be too indulgent to their memory.

**CHOCOLATE** is made from beans that grow in pods on the cacao tree. The trees are numerous in the West Indies, and it is from there we get our supply. The beans are brought hither in the pod and put through a regular manufacturing process to produce the chocolate-oakes that we use. The first operation is the breaking of the husks and separating them from the kernels by a blast of air. Then the beans are ground with sugar by revolving granite grist-stones. The stones are heated, and the oil contained in the bean makes the mass adhere and become a thick paste. This pulp is now partly dried and the air-bubbles are squeezed out in a press, after which it is transferred to the cooling-tables and thence to the molds.

**TO CLEAN AND POLISH BRASSWORK, BRASS PIPES, ETC.**—Take one ounce oil vitriol, one-half gill sweet oil, one gill powdered rottenstone, 1½ pints rain-water; mix and shake well before using; add to the mixture one-half ounce nitro-myrrhane to make it smell good, stick on a French or German label that nobody can read, hoom it in the paper as a newly discovered polish just imported, and you can do a good business. At any rate, you'll have a No. 1 polish, and if your customers don't read the papers too closely, you may get rich selling it. Put on with cotton waste and polish with woolen or chamolis.

**TO DRAW OR WRITE ON GLASS.**—The *Scientific American* advises the use of a varnish of sugar. This is made as follows: Dissolve equal parts of white and brown sugar in water to a thin syrup, add alcohol, and apply to hot glass plates. The film dries very readily, and furnishes a surface on which it is perfectly easy to write with pen or pencil. The heat ink to use is India ink, with sugar added. The drawing can be made permanent by varnishing with a lac or mastic varnish.

**FINDING THE SUN IN A STORM.**—A correspondent writes to the *Boston Journal*: Reading accounts of so many things lost in the snow and fog, I would call your attention to a simple means of determining the position of the sun at any time of the day, which is by placing the point of a knife-blade or a sharp lead-pencil on the thumb-nail, which will cast a shadow directly from the sun, no matter how thick the snow or fog is. Try it.

**THE OSTRICH FEATHER** trade of South Africa is so depressed that the feathers which formerly sold for \$125 now bring only \$7.50, and the value of the birds has declined accordingly.

**TO CLEAN SOLDER** from old files, soak the file in raw muriatic acid for 24 hours and you will have almost a new file.

## ENGINEERING NOTES.

## The Sustaining Power of Piles.

The calculations of the sustaining power of piles is one of the most uncertain and unsatisfactory processes which architects and engineers are called upon to wrestle with. There are plenty of formulae, some practical and some theoretical; but all, as a rule, have been constructed to serve different special cases, and give widely divergent results such when applied to the same conditions. The Sandere formula is the one most generally accepted, and with hammers of a ton weight, and a sinking at the last blow of two, three, four, or five inches, its results under certain conditions are tolerably accurate as to the maximum safe resistance of the pile; but under other conditions it is nearly valueless.

An experiment was made, according to the *American Architect*, with the following results: A pile was driven with a hammer weighing 910 pounds, falling five feet, and sank three-eighths inch at the last blow. By Sanders' formula it should have been capable of supporting safely a load of 18,200 pounds; by Rankine's, of 128,000; by Haswell's, of 72,000; by Nystrom's, of 9000; and by Weisbach's, 111,000. On loading it was found to bear 59,618 pounds without moving, but sank very slowly on the addition of less than 3000 pounds. What should be the factor of safety in such cases it is impossible to say, and Sanders', which would be about three, might not be excessive.

Of course this is only suggested as an attempt to "contract a little the limits of the unknown and uncertain," but it is at least interesting. One observation which Mr. Baker makes is of much importance. The record of driving piles in various places shows that a great difference in the effect of the impact of the hammer results from the "brooming" of the head of the pile. In one case, after the head of a pile which had become badly broomed was adzed off, the efficiency of the succeeding blows was nearly four times as great as before the adzing, and this should form a very important factor in determining constants for practice.

**A NEW INVENTION.**—An improved headlight for locomotives has an adjustment which allows the engineer to conveniently direct the light as he may desire to various points off the line. The lantern is supported on a frame or platform, which has a movement to right or left about a vertical axis, and up and down about a vertical axis, the operating mechanism leading back to the cab so as to be within ready reach of the engineer. By this arrangement the engineer is enabled to examine dangerous or doubtful parts of the road, and in stormy weather to turn the light upon threatening trees or masses of earth or rock, upon either side, and which are liable to fall, so that if they appear in a critical condition, he may instantly check his speed or stop. The device also permits of the lantern being turned so as to throw the light across sharp corners and exhibit the line of track at some distance ahead of the train, and at points which would be entirely out of reach of the light in its usual fixed position. It is well known that in the usual construction and use of locomotive headlights, they are fixed to the engine front, so that the light is always thrown forward and concentrated in one line, this being inadequate in the case of sharp curves.

**A NEW SAFETY CAR-LAMP AND HEATER.**—At Minneapolis, on Dec. 3, a test of the gasoline safety car-heater was made. The heating is done by vaporized gasoline, which sends either hot air or hot water circulating through the pipes in the car. The same gas conveyed to the lamps lights the car. An iron ball, poised and adjusted, is displaced at any unusual jar or bump. In the twinkling of an eye, with one snap, the fire is extinguished. The lamps are put out, and the air-brakes on the whole train are set. As a test, a dummy-car was built of inflammable and flimsy materials on a flat-car, and fitted up with a heater. About a mile beyond the shops, on a desolate embankment, the track was torn up and everything fixed for a bad wreck. The engine took the dummy half a mile up the track and soon it was seen sailing around the curve at a 30-mile-an-hour speed. It reached the broken rail, and then, with a grand plunge through the air, it shot down the embankment. It was completely wrecked, but there was no sign of smoke anywhere.

**A TIDAL WATER-WHEEL.**—The water-wheel that runs the works of the Sagadahoc Fertilizer Company, at Bowdoinham, Me., is probably the only one of its kind in existence. It is 27 feet in diameter, with a foot of its rim out of water at high tide. The spokes are wide and set diagonally, like the vanes of a windmill. It turns 18 hours of the day by tide-power, running one way with the flow, the other with the ebb. With one foot fall of the tide, this wheel gives about 50-horse power. It has been in use since 1861.

**AN ELASTIC SHIP.**—We have already alluded to the proposition to substitute cocoanut fiber for steel in armoring war ships, which is said to be so elastic as to present greater resistance to the penetration of a cannon ball than iron or steel. According to the *Birmingham Age*, the French have decided to coat a vessel with this preparation as an experiment. The vessel so prepared is called an elastic ship.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**KENNEDY.**—Amador Ledger, May 12: The Kennedy mine is moving along as prosperously as could be expected. A portion of the mill is kept running steadily on ore taken from the 750 level. The ore here is of good quality, and there is a considerable body of it. Sinking is being prosecuted as rapidly as possible in both shafts. The new hoisting works over the north shaft are working splendidly—indeed, they are said to be the best works of the kind in the county. About 60 hands are employed about mine and mill. Whittaker Wright came up last week on business connected with the Cleveland mine. The mine is still idle. The new owners of the Gillick mine, near Volcano, are developing that property in a business-like way. They are working three shifts, running drifts and sinking. The indications are very favorable, but they intend to do some thorough prospecting before proceeding to the erection of a mill.

**SUTTER CREEK.**—Our mining interests are moving along in the regular old groove. Sinking at the North Star is progressing slowly. The ground has been quite hard for some time, and does not tear very good in blasting. They are down now to a depth of about 420 feet. There are little stringers of quartz visible, but not of much consequence as yet. It is most likely that they will sink at least 600 feet before they will do any crosscutting.

## Calaveras.

**CAVE.**—Mountain Echo, May 9: One day last week a slight cave took place in the Nevills mine in this town, which brought down tons of good milling ore. The cave did no perceptible damage to the mine. We are informed that the mine is looking excellent and that there is an immense body of good ore in sight.

**MURPHYS.**—Murphys is again assuming its former routine of business. Several of the mines in that section have resumed operations, and other mines will start up shortly.

## El Dorado.

**THE LINDEN.**—Placerville Observer, May 8: Supt. Brown of the Linden placer mine, on Cedar Ravine, is now actively engaged in the erection of a ten-stamp mill for the purpose of crushing the blue cement gravel now being taken out of the mine. The Linden tunnel is now in about 1400 feet and taps the famous old blue gravel channel which traverses the counties of Nevada, Placer and El Dorado, on ranges 11 and 12 East, Mount Diablo Meridian. There are several mills now running on this old lead that are producing large amounts of bullion. The Linden is looking fully as promising as its neighbors. Supt. Brown is hopeful and active.

## Inyo.

**WHITE HILL.**—Inyo Independent, May 12: About two weeks ago Pat Keyes went up on the White Hill, prospecting. Within a day or two he struck a vein of ore. He has already developed quite a nice ore body that shows all the indications of turning out well. Pat Downs is getting ready to pack supplies up to the hill and to pack out ore already taken out. The White Hill country is a good region for prospectors.

**BELMONT.**—The Belmont mine, two miles southeast from Cerro Gordo, turned out a good deal of rich ore in the palmy days of that camp. During several years that mine has been neglected, but recently Jack Davis got a lease of the property and has already taken out several tons of ore of good quality. Much of the ore taken out in the old times went from \$500 to \$1000 per ton. The mine is patented and belongs to Mr. W. L. Hunter. Kelly & McGraw are also working with good results in the same locality.

**IMPORTANT MINING SALE.**—Index, May 9: A rumor has reached the inner sanctum of the Index to the effect that the Union mining property at Cerro Gordo, formerly owned by Belshaw & Beaudry, has been sold to a San Francisco syndicate of mining men. There are millions in it, and if the report proves true we may reasonably expect Old Cerro Gordo to again become the first bullion-producer of the Pacific Slope.

## Nevada.

**PROSPECTING.**—Herald, May 8: Men will take chances in many ways when the venture is not half as promising as in hunting for quartz ledges. There are numerous untouched veins in the country that might make mines. The finder of a promising ledge can generally sell it for more than he could earn at years of hard labor. A walk around in a mineral belt with open eyes is liable to bring the prospector upon such a ledge. The walk is better than lying idle even if nothing is discovered. There are a number of men now acting on this principle in this district and they have made discoveries that may yet amount to a good thing.

**AT THE BRUNSWICK.**—Footbill Tidings, May 10: Within the last few days a ledge has been encountered in the lowest west drift at the Brunswick and the indications are encouraging. The drift is in 230 feet, more than half of the distance being in barren ground. The new ledge is doubtless the one superficially worked years ago by a whim-shaft 130 feet ahead of the present face of the drift, and which paid well and steadily. At this side of the mine there is much virgin ground. Including contractors, there are to men employed at the Brunswick, and the drift spoken of is being prosecuted on very low terms. A large quantity of low-grade ore is awaiting the mill. It is hoped to resume sinking at an early date—the present depth of the shaft being 320 feet.

**HEAVIER PLANT.**—Nothing has been done at the Pet gravel mine this week. With the first of next month a heavier and adequate hoisting plant will be put on the property.

**THE NEVER SWEAT MINE.**—Nevada Herald, May 12: The owners of the Never Sweat mine, located toward Willow valley, are still at work on their ledge and feel confident of uncovering a valuable mine. The rock from this ledge is very high grade, sometimes yielding \$200 and \$300 to the ton. Three years ago the company sunk an incline at a pitch of 45 degrees to the west a distance of 150 feet. From that point they drifted south about 200 feet on a

good shoot of ore. Since then they have run a deep drain tunnel 1300 feet in length and cut the ledge at a depth of 70 feet. This spring they commenced to sink the incline deeper and have found that the ledge turns from a western pitch to an almost vertical position. The change in the pitch has changed the course of the pay shoot from south to north. They have sunk the incline 40 feet on the present dip and find the ledge small, but the rock is of good quality. They have free water and use a hurdy-gurdy wheel for hoisting and pumping power.

**A PROSPEROUS DISTRICT.**—Nevada Transcript, May 9: County Assessor Bond, who has just returned from an official trip to the upper part of the county, says that Graniteville mining district is wonderfully prosperous. Several claims there are producing well, and a number of others are in a fair way to soon become paying properties. The assessment roll of that locality will show a marked increase this year.

**THE EL DORADO MINE.**—The tunnel at the El Dorado mine, south of Columbia hill and between the Grant and Delhi mines, is now in about 350 feet and is going ahead at the rate of 10 feet a week. Quite a stream of water was struck recently flowing from a series of stringers cut in the face of the tunnel.

**THE ELEVATOR PROCESS.**—Nevada Transcript, May 12: As was heretofore briefly mentioned by the Transcript, the Omega hydraulic mine is being operated with the aid of an elevator similar to that which has for some time been in use at the North Bloomfield mine. The washing is done by a monitor, the same as is common in hydraulic mines generally, but the debris instead of flowing off into the South Yuba river is elevated out of the pit where the washing is progressing and carried to depressions in worked-out parts of the claim where it is impounded. It is proving a success, as the Omega Company have to raise the slickens only to about a quarter of the height that the Bloomfield Company does. Some of the anti-mining spies have recently visited the mine, and say there can be no fault found with it by the valley cranks.

## Plumas.

**A NEW PROCESS.**—Greenville Bulletin, May 9: At the Centennial mine, in Genesee Valley, a new method of saving gold is being experimented with by the superintendent, a gentleman from another mining section of the State. A friend has furnished the Bulletin with a description of the process. As the pulp comes out of the ordinary battery, it goes into a trough the length of the battery. This trough is six inches deep by six inches wide. From this trough the pulp runs into a narrow flume which leads it into another trough with tap holes through which the pulp spouts from the latter trough into four sluices covered with canvas duck. The grade of these sluices is  $1\frac{1}{4}$  inches to the foot. The canvas is taken up every two hours and washed in a large tank. The concentrations in the tank are put into a revolving barrel (old Freiberg process barrel) and left there for some time until amalgamation is completed. There is no quicksilver used in the batteries or on the canvas.

**RICH BAR.**—National, May 12: Messrs. Thos. Bracken and G. W. Banghorst claim they have found the feeder that caused the immense deposit of gold on Rich Bar, and are very sanguine that they have a fortune almost in sight. The ledge is at the head of the bar and near the mouth of the French ravine. They have timbers out for 200 feet of tunnel and will commence operations immediately. It is to be hoped that their expectations may be realized.

## San Diego.

**OGELEY DISTRICT.**—San Diego Union, May 10: Walter Garvey and Edward Laundry returned yesterday from Ogeley mining district in this county. The place is situated about 15 miles from Yuma on the railroad. They brought some very rich specimens of gold ore, taken from the mines in the Cargo Muchacho mountains, about four miles from Ogeley. The mines are considerably advanced in development, but at present the mills are closed down for want of water. One company, the Paymaster, which since the first of the year has paid off an indebtedness of about \$50,000, is fluming water 17 miles and keeps its mill going constantly, the output being quite large. The specimens Messrs. Laundry and Garvey brought in are from other mines, and they state that they have a location there, the ore from which mills on an average of about \$54 to the ton. The country is a great one for mining, they say, the mountains referred to being just full of gold. J. H. Dickey of this city exhibited a quantity of gold dust yesterday, brought from a point about 15 miles from Tia Juana, and within 300 yards of the Mexican line. Mr. Dickey stated that he has discovered an extensive placer bed there, and that several pans washed out \$1.25 to the pan. He, together with other gentlemen, will work the claim, commencing operations immediately. The owners of the Burroughs mine, about which so much has been said and written, are making preparations for extensive work in the mine. It is located about 17 miles from this city across the line, and is supposed by many to be the lost mine of the mysterious old Frenchman who died in San Francisco years ago. The shaft is being timbered, and hoisting works are to be built.

## Shasta.

**MAMMOTH.**—Redding Free Press, May 5: The Mammoth mine at Old Diggings is shipping ore to San Francisco. Our reduction works are running to their full capacity, working day and night. Ore is coming in from the Lower Spring mines, and it is panning out satisfactorily to the owners. I. M. Wiley of Delta informs us that Wm. Murry, Ellis, Finley and others have struck it rich on the other side of Dog creek. It seems that they run a tunnel 250 feet, and tapped a mass of decomposed quartz and porphyry. Two sacksful of the mixture, washed out, netted \$1500, and there is plenty of it left. The locality has formerly been very rich in placer diggings. The Mammoth mine is improving every day and they are shipping ore extensively to the Selby smelting works in San Francisco.

**IRON MOUNTAIN.**—Mr. Joseph Bell, brother of our Superior Judge, arrived on Wednesday from a four months' tour among the mines of Shasta and Trinity counties. From him we learn that the Confidence mine on Iron Mountain is now being worked with excellent results. They now dispense with the roasting process, and crush it direct from the mine. His opinion is that the mining interests of Shasta county are but imperfectly understood by outside

parties, or there would be more attention attracted to them.

**GOLD.**—Courier, May 12: Theodore Popejoy of Copper City came in a few days ago and had some splendid specimens of ore, discovered on Kellinger Hill. One of the specimens would weigh a pound, was about six inches in length and half that in width. It was crusted in many places with free gold adhering to a red-colored rock. Popejoy is as confident as ever that the old camp will yet make a big showing among the bullion-producing camps of the State.

**GOOD RETURNS.**—Redding Free Press, May 12: Some two weeks ago Supt. Bergman of the Clipper mine, Squaw creek, shipped two tons of ore to the Selby smelting works at Vallejo, the returns from which, after paying all expenses, were \$209.38. This result was most flattering, and preparations are now being made to ship several carloads of ore. There are some 500 tons of ore on the dump of fair average. Three men are at present employed in running a lower tunnel. Mr. Bergman says that Riley's ten-stamp mill is doing excellent work, and that Jack Conant is working his mine satisfactorily.

**REDUCTION WORKS.**—The proprietors of the Reduction Works are putting in a new Campbell mill, which will double their business capacity; they expect to be ready for a fresh start about the middle of next week. Ore is pouring in upon them from a half-dozen different mines, principally the White Oak of Lower Springs.

**MINERSVILLE.**—Courier, May 5: Nelson Waite has some good quartz at Minersville and also placer mines found in a lost channel of gulch or stream that yields good returns. To say nothing of small gold, he has found specimens which he will bring down in a short time, one of which weighs eight ounces. There is a fine bank of gravel, and an \$80 cleanup of coarse gold, besides nuggets, is not discouraging after a few days' run.

## Trinity.

**THE ENTERPRISE.**—Journal, May 5: The owners of the Enterprise mine at East Fork recently made a good cleanup which was entirely satisfactory. They now have seven men at work and intend to take out a large amount of quartz during the summer and deposit it on the dump, and if every thing shows favorably they will probably erect a mill before another winter.

**BONANZA.**—Trinity Journal, May 10: We learn that operations will be resumed in the Bonanza mine at Minersville next week; the parties who bonded the mine, the time having expired a few weeks ago, have been given another chance.

**MINE LEASED.**—Jas. E. Given of East Fork was in town this week, and predicts a prosperous summer for that camp. He and Frank Moor have leased the Fritz mine from Chris Meckel, and are now crushing ore in the Hippler arastra. They have about 25 tons of ore on the dump, the best of which they will crush.

**HAY FORK ITEMS.**—From Supervisor J. W. Carter, who was in this week to attend the regular session of the Board, we learn that the quartz industry in that vicinity is about as usual. Mr. C. C. Shattuck is running his mill on ore from the Magdalena, and it is thought that it pays satisfactorily.

## Yuba.

**SMARTSVILLE'S MINING PROSPECTS.**—Wheatland Graphic: The Blue Point mine at Smartsville is developing unexpected richness, and 18 miners are at work there now. More laborers will soon be needed to do the work, and a large force will undoubtedly be employed there. A tunnel 300 feet in length has just been completed and the miners are beginning to drift out in different directions from it. An arastra has also been erected. A large number of people were in Smartsville Sunday, from Marysville, looking up mining matters. Other points around Smartsville have been prospected and favorable indications are observed. There is every probability that new mines will be opened soon. At any rate Smartsville has the best of prospects of again becoming the lively hive of industry that it was years ago, and that too in the near future.

## NEVADA.

## Washoe District.

**CONFIDENCE.**—Virginia Enterprise, May 14: The north drift on the 1000 level is in 328 feet, having been run 37 feet during the week. Are now shipping daily to the Brunswick mill 200 tons of ore, the battery samples of which average \$41.88 per ton.

**SAVAGE.**—On the 400 level the south drift has been advanced 19 feet, and continues in good ore. The southeast crosscut from this drift is extended 121 feet. The west crosscut from the face of the north drift on this level continues in fair-grade ore. Are extracting about 100 tons per day of ore of good quality from between the 400 and 900 stations, and are shipping about 70 tons per day to the Rock Point mill. Battery assays from the same average \$28 per ton.

**CHALLENGE.**—The raise is now up a distance of 88 feet, 10 feet having been added during the week. The joint Challenge-Jacket west drift on the 1000 level is in 91 feet, having been advanced 42 feet during the week. This drift shows ore of fair quality. The joint Confidence-Challenge north drift on the 1200 level is in 261 feet, having been continued 29 feet during the week.

**HALE AND NORCROSS.**—From the 600 and 700 levels have extracted the usual quantity of good ore. Have hoisted 1419 tons and have shipped to the Nevada and Mexican mills 1198 tons, the average battery assays being \$33.20 per ton. All the stopes are looking very well. Have bullion on hand for this month amounting to \$24,000.

**BEST AND BELCHER.**—425 level. From the bottom of the winze, 50 feet south of upraise No. 2, a west crosscut has been advanced 25 feet. Formation, quartz of little value. El Dorado tunnel: This company has extended the main west drift 59 feet. From this point a northwest drift will be advanced in our ground.

**BELCHER.**—Have run west from the top of the 1300 raise 35 feet since last report, in quartz yielding occasional fair assays. The connection between the 500 raise and the Crown Point winze has been completed, and a crosscut started west at the point of connection. The face is in good ore.

**SEG. BELCHER.**—The south drift from the upraise has been advanced 18 feet since last report. The

ground has shown no change during the week. The joint Belcher and Seg. Belcher repairs to the 1300 level lateral drift are progressing rapidly.

**WEST CON. CAL. AND VA.**—Sinking shaft making good progress going down through west side of vein and passing through strata of nice ore. Grading for foundation for steam hoisting plant is finished and machinery is expected to arrive to-day.

**CROWN POINT.**—The connection between the 500 raise and 400 winze has been completed and a crosscut started west at the point of connection. The face is in good ore. In the 600 east crosscut have raised 23 feet, all the way in quartz.

**GOULD AND CURRY.**—During the week there has been extracted from the 250 and 300 levels, and shipped to the Douglass mill, 224 tons and 600 pounds of ore, the battery assay of which averages \$25.41.

**POTOSI.**—No. 1 east crosscut from the south drift on the 550 level is in 27 feet in low-grade quartz. No. 1 west crosscut is in 32 feet, all in quartz. The south drift is in 498 feet. The face is in quartz.

**ALPHA AND EXCHEQUER.**—On the 122 level the north lateral drift is in 554 feet. The face is in porphyry and quartz. The west drift is in 12 feet in clay and porphyry.

**CHOLLAR.**—The north drift on the 650 level is in 100 feet, passing through low-grade quartz. The south drift is in 100 feet, all in quartz. North drift No. 2 is in 75 feet.

**YELLOW JACKET.**—The usual prospecting work is going on in all parts of the mine, and are extracting and shipping to the Santiago mill 100 tons of ore per day.

**BULLION.**—Are still crosscutting in the vein east and west on the 640 level. The east crosscut is out 71 feet and the west 75 feet—both being in quartz yielding assays.

**OCCIDENTAL.**—During the week have been digging a ditch and putting in a water-pipe from the Forman shaft tank to the mine. No work has been done in the mine.

**SCORPION.**—The south drift on the 300 level has been advanced 22 feet, making its total distance 255 feet. The face of this drift is in soft vein porphyry and clay.

**IOWA.**—South drift from McBee tunnel has been advanced 27 feet; total 65. The face still in quartz, clay and porphyry, showing some assays.

**UTAH.**—The south drift has been extended 65 feet; total length, 110 feet. The formation is porphyry, clay and quartz.

**ANDES.**—Drifting in quartz east on the 350 level and north on the 240. The latter drift encounters occasional bunches of ore.

**BALTIMORE.**—The pumps are working well and are lowering the water fast.

**ALTA.**—Are extracting the usual quantity of ore from the 1150 and 825 levels.

## Eureka District.

**ORE SHIPMENTS.**—Sentinel: The following number of tons of ore were shipped from the mines of the district to the furnaces during the week: Dunderberg, 111 tons; Union, 114 tons; Silver Lick, 214 tons; Fair Play, 314 tons; Geddes & Bertrand, 814 tons; Lord Byron, 18; and White Pine 1 ton. From the Margaretta, 13 tons; Altoona, 10 tons, and Oriental & Belmont, 43 tons.

**BULLION SHIPMENTS.**—During the week Wells, Fargo & Co. made the following shipments of bullion: Eight bars for Richmond Co., valued at \$16,710.85; passing bullion, nine bars, valued at \$130.30.

**RUBY HILL.**—Prof. Clarence King returned here after an examination of mining property at Hot Creek, last Wednesday evening, and departed for New York yesterday. It was reported that the eminent geologist had come for the purpose of visiting the Richmond mine in company with Mr. Probert, manager of the Richmond Company. We learn, however, that such was not the case, but they did visit the mine together, and from an interview with Prof. King a Sentinel representative learned that from what he saw in the mine, he has not changed his mind in reference to its future. He is still of the opinion that exploration should be continued on Ruby Hill to a further depth of 1000 feet or thereabouts, and that there is no geological reason why ore should not be found if such work is done. He is of the opinion that the ore will be more concentrated below the water level, and that in place of oxidized ore, a mixed more or less with limonite, gold-bearing arsenical pyrites and silver-bearing galena will be found in more compact and undecomposed form, and hence richer than that which the mine has already yielded above the water level. It would take more space than we can give in this issue of the Sentinel to quote all that the learned gentleman said on the subject, but in course of conversation he referred to the inadequacy of the present appliances for draining the water out of Ruby Hill, and said that a powerful line of Cornish pumps would be the right thing for that purpose. He has not the least doubt that the ore goes down below the water level. He approves of the Richmond drill work now under active prosecution, but would not consider a negative result as conclusive. Should the drill corps fail to indicate the presence of either of new ore bodies, or the downward continuation of the vein, he would not hesitate to recommend the employment of sufficient capital to sink and explore the ground by actual drifting. He regards Eureka as being practically a gold-bearing camp, inasmuch as he places the profits that arise from our mines to the production of that metal.

## Tybo District.

**LOOKING WELL.**—Belmont Courier, May 5: Thomas S. Grieves, superintendent of the Ma Alta of Tybo, informs us that this valuable mine never looked better. It is producing large quantities of good ore which is shipped to Eureka for reduction, and after paying all expenses, leaving a handsome profit to its enterprising owners—W. Dimick and L. S. Luse. This mine will give employment to a large number of men this summer.

## Taylor District.

**MONITOR.**—White Pine News, May 5: It was the general opinion here when the Eberhardt Company bought the Monitor mines, that a large area of virgin ground which the company owns would be explored and a valuable property opened up. But with the advent of the new company came inactivity of the duldest kind. Little if any new explorations

have been attempted. Its chief manager went off to Mexico and left the company's newly-acquired possessions in charge of his brother. He too flew the track after awhile and returned to his home in New England, leaving the property in charge of foreman Read, who, no doubt, has conducted the company's affairs as well as he could with the resources at his command. What the Eberhardt-Monitor wants to do with that portion of its property in Taylor district is active management, the prospecting of the ground for which they have paid a big price, less stock gambling and more honest work in its development. A private citizen who would invest his money in a high-grade property and treat it after purchase as this company's int rest in the Monitor mines have been treated, would be looked upon as an idiot and a guardian appointed for him. These remarks may not be palatable in certain quarters, but they are truth. Not an increase of shares, but more work is what the Eberhardt-Monitor Company's property in Taylor needs.

#### Wild Rose District.

THE PARADISE MINES.—*Silver State*, May 8: Nick Frayer reports all the mines at Spring City looking better than for some time past. New bodies of ore are being developed in the Paradise valley. The Cliff is producing rich ore, and some of the ore which Bell & Brannan are extracting from the Rattler assays 900 ounces of silver to the ton. The Cliff Company's mill is being put in running order, and it will be ready to start up about the 15th inst.

#### Gillis District.

HIDDEN TREASURE.—The Hidden Treasure mine is owned by Levi Smith of Belleville. The mine is considered the best paying proposition in Gillis district, notwithstanding the low grade of its ore, which is worth about \$40 per ton. The main shaft is down some 300 feet, and we are informed that there is hardly a drift or cut in the mine but from which large quantities of ore can be extracted. There is a small amount of ore on the dump, and should the contemplated reduction works be erected at Luning, a large force of men will be employed in and about the Hidden Treasure.

CRUSHING.—J. Faegan has 180 tons of ore at the Diablo mill, Sodaville, which he will have crushed. The ore is from his mine in Santa Fe district, and is expected to work about 100 ounces in silver to the ton. P. Gilfoyle made a shipment to the Diablo mill, of a crushing of ore from his mine in Huiches canyon, this county. The mine, the name of which is not known, is an extension of the old Indian Queen.

#### Marietta District.

PAYING.—*Esmeralda News*, May 9: There are now about a dozen men at work in Marietta mining district, this county, and from the following items obtained from a gentleman recently in from the district, it will be seen that the mines now being worked are all good paying properties. The gentleman informs us that there is room enough for at least 100 active men in the district, and that that number of men could find profitable employment in prospecting in and about Marietta. He says that some of the most valuable mines are lying idle for the want of capital and muscle to work them. Joe Moring and Frank Higgs, two old-time prospectors, are working on the Blackhawk mine and have the prospects of opening up a good property. Billy Cook, who recently started to work on a claim in the district, has about five tons of good-grade ore at the Diablo mill, Sodaville, waiting an opportunity to have it crushed. T. Mackey made a shipment of a carload of ore to Selby's Reduction Works last Thursday. He estimates that the ore will work between 60 and 70 ounces of silver, 50 per cent lead and 55 in gold per ton. Bradley & McClellan, owners of the Big Elephant mine, had a lot of ore worked at the G. Argene mine, Candelaria, last week which work about 200 ounces of silver to the ton. They are now at work taking out more ore, and expect to have another crushing ready in about five weeks. F. Magnire, the indefatigable prospector, shipped a carload of ore to Selby's works last Thursday. Frank is confident that his ore will work about 75 ounces in silver and 60 per cent lead to the ton. He has a good mine with a well-developed ledge, and is highly elated over his prospects.

#### ARIZONA.

CASA GRANDE.—*Florence Enterprise*, May 5: The Silver Bell property has been worked on for several years. Several shipments of ore have been made, netting a good profit. The main shaft, No. 1, on south end of claim, is down 72 feet, with good ore in the bottom. At a depth of 30 feet drifts were run each way 45 feet. Here the ledge is 1½ feet wide. Shaft No. 2 is down 45 feet with drifts in bottom, with a showing the same as in shaft No. 1. On the dumps of this claim are a good many tons of low-grade ore. This is one of the good claims of the district and will pay any practical man to work.

INDEPENDENCE.—This is an extension of the Silver Belle on the south. A shaft was sunk 50 feet on the north end of claim on the same ledge as the Atlantic, with results satisfactory to the owners. The continuation of this ledge is traceable for one-half mile to the Chicago. On this claim is some showing. The ores here are 40 per cent lead. These properties are owned by Messrs. F. C. Minshall and Ed Bien of Casa Grande.

AROUND PRESCOTT.—*Journal-Miner*, May 9: Miners are still in demand. Ahab Owen and partners are running their mill in Mint Valley. Frank Alters continues to ship ore from a claim on the Hassayampa district. Coke is expected to commence arriving for the United Verde smelters next Tuesday. Two carloads of ore were shipped on Tuesday and one yesterday from the sampling works. Captain Brann has been employing men to work on his gold property in Turkey creek. E. G. Campbell has decided to Dan O'Boyle for \$500 the Cubb mining claim in Hassayampa district. Clark & Adams think of putting up five stamps to run in connection with their sawmill to work custom ore. F. M. Murphy sent six more miners out on this morning's stage to work on the Congress mine at Martinez. Chas. A. Girdler, the mining man, is in town from Turkey creek, and reports miners all active and doing well in that district. Fisher & Duikie continue to pile up ore on the dump of the Scotch Lassie, and have now 15 tons awaiting shipment to the sampling works. It is stated that San Francisco parties will shortly erect a mill to work the ore from Frank Ryland's mine, near Min-

nehaha Flat. This is one of the most promising gold properties in this section. Mrs. Randolph has five men now employed on the Randolph claim, in Turkey Creek district, taking out rich ore. This claim is looking splendid, a large portion of the ore going 800 ounces in silver. J. J. Williams, superintendent of the Copper Basin Copper Company, arrived on last evening's train and assumed the charge of that property to-day. He will commence preparations at once for the erection of the smelter.

#### COLORADO.

SALE OF THE LUCY GROUP.—*Georgetown Courier*, May 3: The Lucy Group Mining Co., composed of A. J. Minord, E. H. Foster, L. W. Hubbell, G. A. C. Woolley, D. L. Griffith, J. R. Miller, James Abbott, F. E. Headley, G. D. Milligan and W. G. Porter, with the exception of Mr. Foster, all of Springfield, Missouri, on Monday evening, April 30th, closed the sale of the Lucy Group of mines, buying the same of the John Moore estate and Joseph Trudeau for \$35,000 in cash. The property consists of the Lucy, Seneca, Dewdrop, Charmer, Lady Elgin, Ohio Belle, Savannah, Roanoke, Confidence and Wyoming, each full-sized claims, 1500x150 feet, and embracing an area of about 50 acres of valuable mineral land. The main vein is an immense fissure and covered by the Ohio Belle, Lady Elgin and Dewdrop locations, giving 4500 feet on the vein. The Lucy, Roanoke and Savannah are practically parallel veins, while the Confidence, Wyoming and Seneca are cross lodes. During the past winter ten men have been constantly employed on development work, the incorporators having spent at least \$10,000 in opening the lodes, and the result has been such that the bond was closed at once.

NORTH PARK GOLD-FIELDS.—*Denver Tribune-Republican*, May 11: Northern Colorado gives evidence of enjoying quite a gold-mining boom this season. The country has long been known to contain valuable lode veins and auriferous placers, from which much has always been expected. Among the older prospectors in this State, not a few are to be found who have explored the country, and all agree that it contains unusual resources that can be worked to a profit with modern appliances and on an extensive scale. The latest discoveries reported are in the Independence gold district, where a number of quartz lodes are now being opened and arrangements made for the erection of one or more gold-mills. All through Douglas and Lincoln gulches miners are at work, and Laramie City expects to profit considerably by the interest taken in the mineral resources of North Park. The country about Hahn's peak has long been famous for its vast beds of auriferous gravel, and very little booming will be required to turn the attention of old placer miners to that district. Unfortunately, however, it is not generally a poor man's camp, as successful mining operation will have to be preceded by a considerable outlay of money. The gravel beds, as a rule, are above the existing stream, and in order to work them on an extensive scale, ditches and flumes for the conveyance of water will have to be built. With sufficient capital there is no question but that placer mining would return handsome profits, and it will not be long before some of the best deposits and water privileges will be appropriated and work begun on an extensive scale.

CONCENTRATING.—*Georgetown Courier*, May 12: The Black Hawk concentrating machines are, in point of simplicity, economy and general results, the best machines that have yet been tried upon ores. Other machines may do better work on certain classes of ore, but they are more expensive to start with, easy to get out of order, and require an expert to handle them. Hence as an all-around machine the Black Hawk tables are the best introduced in this camp, and a number of our mining men have realized this fact and strongly favor the erection of such works at their mines. Messrs. Hartzell & Woodward, at the Clear Creek mill, have put through about 200 tons of cobblings from the Corry City mine, concentrating 10 tons into one, and handling from 10 to 12 tons a day. The concentrates have been milling over 200 a ton, and they claim to save about 75 per cent of the values in the crude material. When it is taken into consideration that every mine produces an abundance of concentrating material, there is certainly an inducement for the investing of large capital in this direction.

#### IDAHO.

PRIDE OF IDAHO.—*Ketchum Keystone*, May 5: The Pride of Idaho mine, situated on the east fork of Wood river, in Warm Springs creek mining district, changed hands on the 3d instant, the sale having been consummated at that time by General J. B. Winters between the owner, J. W. Davison, and Kansas City parties represented by W. G. Gates, who is here and has taken possession of the property. The price is \$40,000, of which a portion has been paid in cash and the balance is to be paid in a short time in installments. This may be considered an important transfer of mining property, as the Pride of Idaho has been thoroughly developed by years of hard labor by the owner, and has always been self-sustaining, notwithstanding the great amount of deadwork carried on to make it a mine.

SHEEP MOUNTAIN.—*Challis Messenger*, May 8: The new mining district of Sheep Mountain lies about 125 miles northwest of Hailey, and, as near as can be determined, is located in the southeast corner of Idaho county, although Custer claims it as within her borders. The district is an extensive one and has been divided into three subdivisions—Sheep Mountain, Greyhound and Sea Foam. The ores of the latter are free milling, while heavy galena and carbonate ores prevail in the others. While the Sheep Mountain country has been more or less talked about for several years, the real extent and richness of the new mineral field was not fully realized until last summer, when the result of the season's work developed the fact that at least a dozen of the claims gave every assurance of becoming permanent mines and producers of a good grade of ore in large quantities.

GOLD BELT BULLION.—*Wood River Times*, May 9: A gold brick worth \$1000 has been brought in from the Camas No. 2 mill. This was the result of the last five days' run, of 15 stamps of the mill. The ore run through during that time yielded an average of \$10 to \$12.50 per ton, on the plates only. The complement of 20 stamps could not be run because

of the lack of water, neither could any sulphurets be saved, for the same reason.

A SUCCESSFUL TEST.—A working test of ore from the Welch group of claims, on the Gold Belt, has just been made at the Camas No. 2 mill, for Colonel Barr of Kansas City, who was here a week ago, looking at the claims referred to. The ore yielded an average of \$15 60 per ton in free gold. This ore was from the very surface, and shoveled into wagons as it lay on the dump, without any sorting whatever. The test is therefore satisfactory. Something remarkable about the ore is the almost entire absence of sulphurets. This gives plausibility to the statements made last year, to the effect that the ore is less base, the gold freer, toward Beaver creek than it is in the claims adjacent to Rock creek.

THE HUB MINE.—*Wood River Times*, May 9: Colonel Bullentine and Sam S. Wilson of Muldoon, who came in yesterday to procure a hoisting engine and pump for the Hub mine, situated six miles this side of Era, have purchased the little rig formerly used at the Guy mine, which is of sufficient capacity to sink to a depth of 300 feet. By using this rig the lower tunnel on the Hub can be connected with the surface, and the workings continued at least 150 feet deeper. This, the gentlemen think, will sufficiently prospect the mine to demonstrate its value.

#### MONTANA.

SAN FRANCISCO.—*Phillipsburg Mail*, May 5: The gratifying developments of the past week are of such a nature as to place this property in the first rank as a prospective bonanza, and the feeling among mining men throughout the district is one of intense satisfaction that the enterprise has passed out of the problematical state it has been in for so long a time. We have no hesitation in saying that the present showing in the workings of this property makes it entirely certain that the San Francisco is a permanent and valuable mine. The 5 feet of low-grade ore recently encountered in the east drift of the 200-foot level was found on the north side of a slip or crevice that came in at that point. This spur or offshoot made so rapidly to the north that it was given up early last week and driving on the south side of the slip, which had been commenced and discontinued, was recommenced, and last Saturday the edges of the ore body constituting the present strike were uncovered. The pay-streak of the new find is 2 feet in width and assays from 400 to 1100 ounces to the ton. The most gratifying feature of this new development is that it was expected beforehand, the running of the east drift on this level being for the purpose of encountering the rich chute of ore uncovered by the winze on the 100-foot level, and that this present find is none other than the same chute is proved by similarities in the ore, gangue and vein-structure and casing which there can be no mistaking. That the ore was encountered some 75 feet sooner than expected only goes to show that the chute is widening (in the direction of the strike of the vein) in depth, and widening rapidly. At the 400-foot level the crosscut is being continued, because, although some good quartz has been encountered, the management is in some doubt as to whether it is the vein proper or a spur or filled-in crack or offshoot. When this matter is definitely settled the drifting will be actively pushed on the vein.

RED BLUFF.—*Cor. Bozeman Chronicle*, May 9: There is more quartz on the dumps of this camp at present ready to be worked than there has been at any time for the last ten years. In the Grubstake, the boys have struck the best and biggest shoot of ore ever discovered in that remarkable lead. Eighteen inches of 300 rock is not a thing to be sneezed at. Pope, Balless & McKee are highly elated over their big strike. William Reese and his partner are working in the Boas, getting out ore. In the Apalachee, Jack May and John Harper are at work taking out ore. The boys had remarkable luck there in drifting for development. They came across a shoot of ore of a very high grade—\$80 per ton (the Apalachee is altogether free milling), and they are taking it out now at the rate of about a ton per day. Geo. Badgett is working on the Red Bird. He has a big pile of quartz on the dump and also in sight in the lead. Jim Kelly and Dan O'Shea are working on their lead, the Tigris, in silver ore—about 18 inches of rock, assaying \$150 per ton. Carren Adams and Hader own the Elkhorn, not far from the Tigris, and had some assorted ore shipped that went 180 ounces of silver to the ton. W. P. Grannis, who has been prospecting in the same neighborhood, has lately discovered a lead that shows a good deal of native silver. "Old Haines," who is a well-known character in our camp, also has a large amount of quartz, and expects to have quite a run of ore through the mill. The mill here is admitted by all to be a success. It is running right along, and gives employment to a number of men at good wages. The Ayox has been represented, and there is a good streak of very rich ore in the shaft. R. H. Foster and Chas. Holdman lately took up some placer claims, and have demonstrated to their own satisfaction that there is much money in their claim. The great trouble appears to be about a sufficient water supply, but they have made arrangements with parties here that will give them all the water they need, and by another season their ditches will give them water enough to work the ground by piping it.

#### DAKOTA.

LEACHING WORKS.—*Deadwood Pioneer*, May 5: An official visit was yesterday paid to the old smelting grounds below the city by Prof. R. D. Clark, John P. Belding and Harris Franklin of the Deadwood Reduction Company, and engineer Thomas H. White, who has been employed to establish grades preparatory to erection of the leaching plant. The grounds are admirably adapted for the purpose and but little grading will be found necessary. The title still rests in the old smelting company upon which organization has never been perfected. Mr. Franklin yesterday looked up stockholders, however, and began obtaining consent to relinquishment of title to the new company. This was readily given, as no disposition exists to put a stumbling-block in the way of the enterprise, upon which so much hinges. Work on the plant will commence at some date within the very near future; probably immediately on return of Professor Clark from Rapid, when subscribers of the reduction company will hold a meeting, and perfect organization by electing permanent directors (probably the charter members of the board now exercising executive powers satisfac-

torily), and adopt a code of by-laws. When work does begin it will be prosecuted continuously and uninterruptedly until the plant is completed.

THE QUEEN BEE.—*Black Hills Pioneer*, May 12: Captain Fred H. Griffin came down yesterday from the Queen Bee. The ten-stamp mill is now pounding away steadily on ore from the mine, crushing about 18 tons per day. The concentrators are said to work well, and Captain Griffin is confident that the problem of successfully working the ore has been solved. It is the intention to continue the operations and possibly ere long add to the capacity of the mill.

THE FAIRVIEW.—The Fairview mill, on Little Rapid creek, which was shut down for a time, is again in operation. So far as the ore from the Basil and Fairview has been worked, it has yielded a good profit, and the success of the enterprise has done much to strengthen confidence in the mines of the Central Hills generally.

FLOAT.—Henry Keimer is mining for silver in Go-to-Hell gulch, above Central, and thinks he has the richest find yet made in the hills. He is only in 20 feet, and yet has a three-foot vein of ore that assays from 130 to 140 ounces. The vein seems to be vertical and a true fissure, with porphyry on one side and quartzite on the other. Central City will yet be a prosperous mining camp, as in the early days.

#### OREGON.

SPARTA MINES.—*Bedrock Democrat*, May 12: The *Democrat* reporter yesterday met and conversed with Major Ira B. Schenck, the mining man who recently returned from a visit to the mines of Sparta and Snake river. Of the mines in and about Sparta, Major Schenck speaks enthusiastically. The Del Monte mine, controlled and operated by Dr. Lewis, is one of the most promising mining properties he has seen for years. The main tunnel is in over 200 feet on the ore vein which in width fills up the tunnel. The ore is high grade, mostly gold sulphurets in character, is very favorably situated for easy handling, and consequently cheap working. The extent of the ore body is hard to estimate, it being so extensive that thousands of tons are in sight. The Del Monte is no longer a prospect but a well-developed mine. Capitalists in search of a valuable mining property should turn their attention to the Del Monte. The Major says they will find it all a thorough mining man can ask for. Other locations of the Del Monte group of mines show well for the amount of development work accomplished. A large amount of ore is in sight, and very favorable tests have been obtained by the assay process. The Major is of the opinion that Sparta will eventually be one of the largest bullion-producing camps of Eastern Oregon, and this opinion is one of great value, coming as it does from a man whose knowledge of mines and mining is conceded to be second to that of no expert on the Pacific Coast.

#### UTAH.

REVIEW.—*Salt Lake Tribune*, May 11: The week has been one of unusual quietness, and the aggregate receipts have been light by the bank. The receipts in this city for the week ending May 9th, inclusive, were to the aggregate value of \$72,508.18, of which \$37,352.74 was bullion and \$35,155.44 was ore. For the previous week the receipts were \$220,748.57, of which \$44,934.80 was bullion and \$175,813.77 was ore. The Ontario output for the week was from ore sales, \$10,263.13; no bullion. The Ontario produced for April, bullion, \$5,377.21 fine ounces; by ore sales, \$73,476.55; an approximate total of \$158,853.76. The Daly product for the week was 8868.18 fine ounces of bullion; no ore sales. During the week there was received \$1700 in gold bars and \$8668.18 in bars of fine silver. The Hanauer smelter produced during the week bullion to the value of \$8080; the Germania \$18,704.56. Ore receipts in this city for the week were \$11,990, by Wells, Fargo & Co.; \$5800 by McCormick & Co., and \$17,365.44 by T. R. Jones & Co.

#### BRITISH COLUMBIA.

CAYUSE CREEK MILLION-DOLLAR MINES.—*Indian Sentinel*, May 9: The work of opening up the Bonanza claim goes slowly on, the shaft being down some 50 feet. The company have had altogether some 20 mill tests and assays made, which show an average test of \$60 to the ton. Four recent assays from various portions of the ledge are as follows: One from the shaft at a depth of 50 feet, 108 gold per ton; one taken from drift off ledge, 90 gold per ton; one from croppings, 800 feet above ledge, \$36 in gold; another from croppings, \$38 in gold. In the assays made no one has been devoid of a gold return. The owners are more confident than ever of the worth of their mine, especially since a Denver expert who visited it, stated that there was from \$300,000 to \$400,000 worth of ore in sight. Nothing short of a million dollars will now purchase the properties owned by the company.

OFF FOR MONTE CARLO MINE.—Messrs. F. A. Ingham and George McDonald, owners of the Monte Carlo mining location on the North Thompson, left here Monday with supplies for three months' prospecting and development work on the property, which is situated about 200 miles north of Kamloops. An assay of the rock from this location made at Ottawa last fall showed 4½ ounces of gold and 21½ ounces of silver to the ton.

KAMLOOPS COAL MINES.—During the past week there has been considerable excitement in town over the reported discoveries of coal seams near Guerin's ranch, about four miles southwest of town, and on Thursday last representatives of the *Sentinel* visited the location. There is pure coal in Kamloops and apparently millions of tons, but the amount can only be determined by further tests. Two tunnels have been drilled into the leads at the coal mines, one by Mr. Guerin and the other by Mr. G. Loney. The tunnels are already in some 30 feet and have cut across several seams of coal running from some inches to three feet. Mr. Loney is drifting west by north from the gulch and is taking out coal in a fairly pure state, several parties having built fires and burned it at the mine. Mr. Guerin is drifting on the seam south by east, and intends sinking a shaft when he has tunneled the mountain several yards further. There has been great excitement over the discovery and numerous claims have been taken up, the country being staked off for some miles on either side of the gulch.

HOOKER &amp; LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

— THE —

**DOUBLE "ECONOMIC" STAMP MILL.**

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

**AN AUTOMATIC ORE FEEDER**

Goes with each Mill. We also have a suitable

**Rock Breaker.**

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

## Our Agents,

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JOHN G. H. LAMPADUS—Santa Barbara Co.  
G. W. ISADALL—Arizona Territory.  
A. F. JEWETT—Tulare Co.  
C. E. WILLIAMS—Yuba and Sutter Co.'s.  
R. G. HUSTON—Montana Territory.  
G. D. CUMMINS—Butte and Tehama Co.'s.  
J. L. DOYLE—Kern Co.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Sales quartz machinery, and offers easy terms for introduction.

## Books on Assaying.

By C. H. AARON.

## PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can take his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

## Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Lignite; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

## PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.  
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

## Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Polished Zinctate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Selenium; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

## DELINQUENT NOTICE.

Butte Creek Hydraulic Mining Company.  
Location at principal place of business, 213 Market St., San Francisco, Cal. Location of works, Butte county, California.

NOTICE—There are delinquent, upon the following described stock, on account of Assessment No. 12, levied on the 27th day of March, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificates.	Shares.	Amount.
Ed. Dexter.....	80	500	\$ 25 00
Chas. Morse.....	92	500	25 00

Ed. D. Rue, Tr.....	102	2900	145 00
Ed. D. Rue, Tr.....	104	100	5 00

And in accordance with law, and an order of the Board of Directors, made on the 27th day of March, 1888, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 213 Market street, San Francisco, Cal., on Monday, the 28th day of May, 1888, at the hour of 1 o'clock p. m., of said day, to pay Delinquent Assessments thereon, together with costs of advertising and expenses of the sale.

LOUIS R. LEVY, Secretary.

OFFICE—213 Market St., San Francisco, Cal.

## MEETING NOTICE.

Office of the Alabama Mining Company,  
Corner of Fifth and Stevenson streets, San Francisco, California, May 12, 1888. Location of works, near Newcastle, Placer county, California.

NOTICE is hereby given to all the Stockholders of said Alabama Mining Company (a corporation) that there will be a general meeting of the Stockholders of said company held at the office of said company at the S. W. corner of Fifth and Stevenson streets, in the city of San Francisco, Cal., on Monday, the 11th day of June, A. D. 1888, at the hour of 1 o'clock p. m. of said day, for the purpose of removing from office the following named Directors of said company, to wit: Owen King, William Reinhold, Samuel Jones and Michael Hoffman, and for the further purpose of filling by election then and there the vacancies that may be caused in the Board of Directors by such removals.

The undersigned is the owner of more than two-thirds of the capital stock of said corporation, as well as a Director and President of said Company, and makes this call under the provisions of Section 310 of the Civil Code.

J. J. SMITH,

President of the Alabama Mining Company.

THE RAND DRILL COMPANY,  
23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

Dewey & Co.'s Scientific Press  
Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

GREAT REDUCTION!

### BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no platinized or rotten iron used. Only genuine Russia iron in Quartz Screens. Platinized iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

### PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot-Cut hurred and Slot Punched Screens. Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,  
21 & 223 First St., San Francisco, Cal.  
JOHN W. QUICK, Proprietor.

### THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most ample and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

### ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Trams, cars, etc. Address

The Pelton Water Wheel Co.,  
127 FIRST ST., SAN FRANCISCO, CAL.

### QUARTZ SCREENS

A speciality. Round, slot or hurred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American platinized iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

INVENTORS, TAKE NOTICE!

## The Pelton Water-Wheel.

From the time the memory of man runneth, the rivers flowing westward from the great Sierra Nevada range have been wending their way down the mountain canyons and through the valleys and plains, without thought of utilizing the vast resources they afforded. Upon the first discovery of gold on this coast, water was found to be an element of prime necessity in all mining operations. At first its use was confined to the working of cradles and running sluices. When the era of quartz mining came in, it was found equally necessary in all reduction processes, even before thought of as a source of power. To make it available over any considerable extent of country, it was necessary to divert the streams from their natural channels, and bring them down on the divides that separate all the great water courses, at such an elevation as to command a large extent of country. Early in the fifties, many ditch and canal enterprises had been inaugurated, which have been constantly multiplying and enlarging, so that all that portion of the State bordering the foothills is now covered by mountain streams, affording water facilities of inestimable value, both to the mining and agricultural interests.

It soon became evident that water so generally distributed ought also to be made a source of power in mining operations, and thus dispense with costly steam plants. How to utilize it with such high pressure and in an economical way was the problem. No turbine wheel was adapted to, or had ever been run under such conditions.

As has been generally the case when a great want exists, means have been found to supply it. Several years of persistent experiment developed what is known as the "Pelton wheel," illustrated on this page, and which is now running a great deal of the mining and manufacturing machinery on this coast where water-power is available. Its great value to mining and industrial uses is now universally recognized, and it is coming largely into use in all parts of the world.

The first application of this motor was at the Idaho mine, at Grass Valley, Nevada county, some seven years ago, where a test was made of the various wheels in use to determine their relative value. The Pelton developed at this test over 90 per cent of efficiency, and was so far in advance of all competitors that it was immediately adopted by that company. Thirteen of them were at once put in to run their

mills, hoists, pumps, air compressors, etc., in fact affording all the power for these extensive works. During all this period no break-downs or delays of any moment have occurred, though the pumping and hoisting has been carried to a depth of 1600 feet.

It may be stated in this connection, illustrating the value of such a power, that the Idaho Company spent some \$45,000 in bringing water to their works, which amount was almost covered by their first year's run.

power cannot be availed of. To show what is now being done in this way, the Big Bend Tunnel Co. of Butte county, operating on the Feather river, are putting up an electrical plant, transmitting power over an 18-mile circuit, for the purpose of running pumps and hoists, the power being furnished by a Pelton wheel located a mile below the outlet of their tunnel.

The Chollar mine of Virginia City is also putting in a Pelton wheel at the Sutro tunnel level of their shaft, to be run under a

## Stamps and Roller-Mills.

Although there was a conservative prejudice against roller-mills for crushing quartz when they were first introduced, this has gradually disappeared, as their utility has been proven. Many men thought that under no circumstances would these mills take the place of the old stamps, but they have done so and have even excelled them in many instances. Roller-mills are not the most economical under all conditions by any means,

but the same thing may be said of stamps as well. Under certain circumstances the roller-mills will give better results than stamps. Where the ore is soft or friable, and large quantities are to be handled, the roller-mills will do good work and show large capacity. Witness the results at the Spanish mine, Washington township, Nevada county, where they are working gold ore cheaper than anywhere in the world. They use roller-mills at that mine and make a profit out of rock worth only 65 cents a ton. This is a record that stamps have never made.

There are places now where stamps are used, and where rollers would give better satisfaction. An instance may be cited in the case of the Signal mill, Arizona,

where they have very soft ore much resembling that of the Spanish mine referred to. It is soft and easy to crush. Yet heavy stamps are still used to work it, though roller-mills could treat larger quantities at very small cost.

Of course in most cases the old stamp is best, but with soft ores, in quantities, the roller will show more economical results. And for prospecting operations, in opening new mines, etc., any of the cheaper appliances for ore crushing will answer very well. There are several varieties of the roller-mills, rocking-mills, disk-mills, etc., which answer their purpose very well, and cost little as compared with the stamps. As stated above, the prejudice against these improved appliances is rapidly disappearing, as is proven by the increased sales reported of late by the various manufacturers in this city. They are not only in use on this coast, but are being shipped to Australia, Africa, Mexico and Central and South America.

THE Juneau (Alaska) Record says: "The Ancon brought up a couple of Chinamen and lauded them on Douglas island. This piece of news soon reached Juneau and a committee of about 30 miners visited the island and notified the proper persons that the Chinamen "must go," and they went on the return of the Ancon from Sitka.

THE PELTON WATER-WHEEL.

The advantages of the Pelton wheel as a motive power are so many and so obvious that large expenditures are now being made by many companies in bringing in water to make this power available. It is no exaggeration to say that this marvelous little motor has effected a complete revolution in mining operations wherever it has been introduced. The cost of working low-grade ores has been so greatly lessened that many mines are now being worked with substantial profit, which had to be abandoned years ago under the too expensive system of steam-power.

One of the most interesting and important applications of power now attracting wide attention is that of utilizing water-power from distant localities by means of electrical transmission. In many cases the source of power is too remote to be availed by the ordinary system of ditching or piping, or cannot be obtained at points where required with sufficient head.

The advances that have recently been made in electrical transmission warrant the belief that power will soon be carried in this way, at least 20 miles, with comparatively small loss. Many electrical companies are now guaranteeing to transmit from 60 to 75 per cent of the primal energy developed a distance of from five to ten miles. By this means there are few localities in the country where the advantages of water-

1500-foot head, which is to drive five dynamos of 100-horse power each, the power thus developed being conveyed to the surface and then to their mill some half a mile away.

The magnitude and extent of operations of this character which are being projected or in course of development will soon convince the most skeptical that, though electricity is a rapid courier, when we come to understand how to harness it to its work, it is destined to do most of the heavy hauling of the world.

The business of the Pelton wheel has recently been put into an organization known as "The Pelton Water-Wheel Company," and will hereafter be conducted in this city at 127 First street, under the general management of Mr. A. P. Brayton, Jr., with Mr. L. A. Pelton as consulting engineer.

WALTER J. COLLINS, a well-known mining man, formerly foreman in the Justice mine, who has lately been employed as superintendent of the Benton Consolidated Mining Company, has been arrested on a charge of forgery, perjury and embezzlement. The president of the company, John T. Hill, who caused the arrest, says that Collins has been carrying dum-mies on the pay-rolls and crediting men with more by twice than they really made, and that he has forged orders on the company.

## CORRESPONDENCE.

We admit, unadorned, opinions of correspondents. - EDS.

## The Wail of the "Tenderfoot."

[Written for the PRESS by M. A. GATE.]

O Boss of the mining scheme! what can you offer  
To brace up a tenderfoot's faith in the game?  
Where he staked every dollar he had in his coffer,  
And patiently waits for a boom on the claim?

Tidings from Gilead bear they no solace?  
Bring they no balm for the soul?  
Are we no nearer the end of the struggle?  
See we no clearer the goal?

Oh! where is the gold that shines as the noonday?  
Where is the silver that gleams as the star?  
Have the bright apples that blushed in the sunrise  
All crumbled to ashes and scattered afar?

See we no longer the smoke of the smelter?  
Hear we the din of the stamp-mill no more?  
Rings out no sharper the clink of the chisel  
Drilling the granite in quest of the ore?

Hear we no rumble of carts in the tunnel  
Deep in the mountain, dark, dismal and cold?  
Comes forth no quartz bearing three hundred  
ounces?

No carloads of gravel all glittering with gold?

Must the hope of vast wealth forever be banished?  
How fleet are the years! How we're all growing  
old!

Dreams of great riches, how soon are they vanished!  
How sorely we need a few ounces of gold!

## Montana Mines.

[From our Correspondent, R. G. HUSTON.]

## The Dogtown District

Is a new discovery 18 miles southeast of Elkhorn, and its euphonious name comes from the fact that it is a regular prairie-dog settlement. The Summit mine, the first discovery, is owned by Messrs. Allen & Carpenter. A shaft is down 65 feet and they have a ledge of 34 feet of ore with assay value running from \$50 lead and silver up to \$200 per ton.

## The Blackhawk.

Owned by Morris Broe, has a shaft down 60 feet and from five to six feet of ore. This is not as high grade as the Summit, but is a very flattering prospect.

There are a number of other locations, the Silver Safe, Montana King, Mountain View, Blue Bird, Silver Bell and McAuliffe. Work will be commenced on all of these during the next month. The district is certainly a promising one. It lies on the bench land between Crow creek and Boulder, and a railroad is to run from Three Forks to connect with the Boulder valley branch at Boulder, which will run within a stone's throw of these mines. If they prove continuous they may be considered virtually poor men's mines, and will yield to the general prosperity of Jefferson county. It seems almost like a romance that mines should be discovered here when miners have been traveling back and forth for 20 years and no one ever thought of mining being there.

## Big Foot District.

This is another of Montana's new mines, and is also in Jefferson county. It was discovered about six months ago, and developments are going on every day. The location is on the headwaters of White-Tail-Deer creek, 10 miles southwest of Boulder and directly tributary to the county-seat.

The Big Foot mine is an incorporated company. They have a shaft down 75 feet, and have crosscut to the ledge. Levels have been run on it for some distance. They have a large body of ore which assays from \$100 to \$200 per ton. Development work is being pushed as rapidly as possible, and the company are desirous of proving the value of their property this season.

## The Grizzly.

Owned by Vining Cook and Fred Berendes of Boulder, is bonded to Starret of Wickes (who is supposed to be operating for Hauser and others of Helena) for \$20,000. A shaft is down 60 feet. They have a ledge of ore three feet in width, averaging from 30 to 40 ounces silver, and 50 per cent lead. The parties holding the bond are experiencing considerable trouble with the water. It is almost an impossibility to prospect a mine to any depth without pumping facilities.

## The Alida.

Owned by Williamson & Gaffney, has a shaft down 30 feet. There is a large vein eight feet wide, with one foot of solid ore assaying 30 to 35 ounces silver and 35 to 40 per cent lead, making it a profitable ore and a mine that will develop itself.

## The Summit Mine.

Owned by Williamson, McDonald and others, has a shaft down 100 feet. The owners crosscut at the 50-foot level, and have three feet of quartz and galena which assays silver and lead \$90 per ton.

## The Lucy

Is owned by Anderson, McGee, and others. A shaft is down 50 feet, and they have 18 inches of galena ore carrying 40 ounces of silver and 40 to 50 per cent lead. Taken as a whole, these two new points of interest have made a fair showing for the amount of work done. Of course, the coming season will prove the merits

of them to the owners' satisfaction, and some of them are likely to prove veritable bonanzas. The Montana miners need not take any wild-goose chases after some jack-o'-lantern prospect in Alaska or South America, for they have plenty of good undiscovered mines, and many that have been discovered that are as yet undeveloped.

## Inyo County Mines.

EDITORS PRESS:—At Owens valley, near Little Lake, a gold ledge has recently been discovered about two and a half to three feet in width which shows free gold quite plentifully, and no doubt will pay handsomely with proper work and facilities for reducing the ore.

The mountains around this part of the county have been but very little prospected, although the evidences are strongly in favor of rich discoveries of both gold and silver.

At Darwin, but little work is being done at present, owing to the high charges of transportation of ore to the Carson & Colorado railroad station, at Keeler, which are \$6 per ton. As the reduction works at Keeler are not in operation, all ore has to be shipped over the railroad to San Francisco, making a long haul at great cost. The charges are based on the value of the ore which prevents anything under 60 ounces of silver to the ton being shipped; whereas, if the railroad run down the valley to Mojave, making a shorter haul, lower-grade ores could be shipped to a profit.

At Cerro Gordo most of the work now being done is by lease of the various mines and by chloridizers, all of whom, however, are doing exceedingly well. Those at work in the Diaz mine are taking out ore that averages 90 ounces of silver and about 65 per cent of lead to the ton.

The San Pedro and Aries mines are being worked by chloridizers who are doing equally well.

The San Lucas mine is worked by five men who are constantly shipping their ore to San Francisco.

The Union mine has now only four men at work, who extract about six tons per week on an average which yields 100 ounces of silver and 50 per cent in lead to the ton of ore.

The Ygnacio mine is under lease to George Reese. This mine has now over 10,000 tons of ore thrown over the dumps that will go 40 ounces of silver to the ton besides carrying some gold, and at least 20 per cent of lead, none of which is saved or worked on account of the Swansea works at the foot of the hill being closed down. Consequently it will not pay them to ship any ore that pays less than 45 ounces of silver per ton. This mine has produced since it was opened over \$6,000,000, and there is no doubt but that it still contains double that amount. Want of enterprise apparently of the owners, and stoppage of the smelter at the lake, has depressed all operations and caused lethargy where all should be activity, for the Cerro Gordo group of mines is doubtless among the richest in the State of California.

The Indiana mine near Owens lake is a small vein varying from 6 to 12 inches in width, but yields about 150 ounces of silver and 30 per cent of lead to the ton. Only two men are at work on it at present.

## Mining-Law Amendments.

EDITORS PRESS:—I saw by the PRESS of April 25th a copy of the amendments to the mining law. Now the miners of this (Cave Creek) district got together and we read the amendment as you have printed it, and we think the law is all right, except one clause. That is that a miner shall not locate more than one claim on the same vein. Now, while it is hard to make a law to suit all, still it is but right and just that the prospector, who is the pathfinder of all our new country, should have some priority of right. He goes into a wild country and finds a good prospect and can only locate one claim on the same lode. Some one follows him, locates up against him and waits till he does his work, and if she pans out he will try and get rid of his claim at some price on the strength of the first one's prospect. After all, it does not deprive one from owning more than one claim on the same vein. What we want is a law that will compel the miner to do a certain amount of work in a certain time. That will open more country and do more good than trying to stop miners from locating claims.

Cave Creek, Arizona.

A MINER.

## Kern County Mines.

EDITORS PRESS:—There are but few miners at work throughout the county at the present time on account of want of water in the placers, although at Kingsville some men are working who have small ditches in connection with their claims, and these are making most excellent wages all the way from \$40 up to as high as \$100 per week to the men.

At Kernville, Judge Sumner employs ten men in his claim, which we hear is paying very well.

The Big Blue Quartz is still idle, with but little prospect of reuming for some time on account of the water in the mine, which cannot be taken out until new hoisting works are erected.

ed, the old works having been burnt down some time since.

This mine formerly kept an 80-stamp mill going. The mill, which is standing idle, is in charge of Mr. Price, brother of Thos. Price of San Francisco.

At Hanlah the district is comparatively dormant, although some prospecting of quartz ledges is going on. The cause of inactivity is in some measure owing to want of milling facilities, two mills having been burnt down there. However, teams were met near by loaded with a five-stamp mill going in, which will be erected immediately.

Mr. Burbridge of San Francisco is prospecting a ledge here which gives promise of favorable results.

K.

## The Mining Law Changes.

EDITORS PRESS:—Senator Stewart's new mining law, as I understand it, limits a locator to one location on the same lode, lead or vein. Now opposing I make two discoveries, say 2000 feet apart, and both discoveries show a body of ore with well-defined walls and apparently having the same course, how am I to know whether my discoveries are on the same vein or not, and can any one tell without uncovering the ledge the entire distance between the two points of discovery? What, therefore, would prevent me from making two locations claiming that there were two veins, and who could dispute it successfully? But supposing some other fellow would locate over me on one of my claims, just making difference enough in the lines to give him room to do his assessment work on his own ground, and that I should go on and work my claim and find out that they were really on the same vein, could the other fellow come in for damages? And further, suppose I locate two claims truly,

believing at the time that they are parallel veins, but after working I find out that I have been mistaken and that the vein runs as marked with dotted lines. Should the "other fellow" find it out, could he locate over me and hold the ground on one of my locations? and if so, on which one? I presume that my first location would hold. I can't see how the new law will be any ahead of the old one in the above particular, but, on the contrary, will open the way for more litigation, I believe.

Wallace, Idaho.

W. S. H.

## New Coal-Fields.

Messrs. G. Wingate and E. P. Thompson of Clatsop county returned Friday from Washington county, whither they went last Monday for the purpose of inspecting the newly discovered coal-fields. Mr. Wingate is an expert in the business, having been superintendent of a coal mine at Coos bay and having opened a mine on Vancouver island near the Wellington mine. These gentlemen say the Washington county mines are extensive and in an unbroken country. Not enough development has been done on the croppings to show the thickness of the veins. The county has the appearance of a coal country, and it will be very easy to prospect. Should the coal prove to be of good quality in paying quantities, it will be no task at all to reach it with a railroad.

Hon. T. B. Handley has visited the coal-fields, and sends to this week's Hillsboro Independent the following letter:

From notes of a visit to the coal-beds of the Nahalem I furnish you the following items:

So far as prospected, the coal lies in Columbia county, in the territory between Pebble creek and Elk creek, in township 4 north, range 4 west. In this scope 26 claims have been located, containing each from 40 to 160 acres.

The country is very broken and rough, being a succession of deep ravines and steep ridges, mostly burned over and covered with fallen timber and tangled underbrush.

It can be reached best by way of Archbold's mill and the old State road, which is open for wagons within two miles of Pebble creek, and can easily be cleared the remainder of the way.

An easy route for a railroad can be had up a branch of the west fork of Dairy creek and through a low pass to Pebble. On this line there is very little elevation in the way of railroading.

No systematic prospecting has yet been done, and nothing more than croppings have been tested, but enough is known to justify the conclusion that an immense ledge underlies the entire tract. The croppings show in the gulches from a trace to five feet in thickness, bituminous coal of a good quality, pitching slightly to the north and east.

Some idea of the importance of this find can be had by figuring on a three-foot ledge, which will be found to contain over 3,000,000 tons to the square mile.

There can be little doubt that the ledge is over three feet thick, and that in a short time we shall see a railroad tapping the mine and thousands of miners enriching themselves and the country.—Portland Oregonian.

## The Original Pittsburg.

According to the prospectus published in the London papers, the price to be paid for the Pittsburg (Grass Valley) mine is £90,000. It is payable entirely in fully paid-up shares, or, at the company's option, partly in cash and partly in paid-up shares, the minimum of shares to be taken by the vendor being £33,333, leaving a balance of £10,000 available for working capital. The new company is called the "Original Pittsburg (Grass Valley) Gold Mines Limited." The capital is £100,000 in shares of £1 each. The subscription list closed on the 24th ult., in London. The California directors are Julius Bandmann, Fiesco Mandelbaum and Reuben H. Lloyd, all of San Francisco. The mine has been reported on by Prof. Constantius Hensch of San Francisco, and Gilbert Pitcairn Simpson of London.

The prospectus says: "This company is formed for the purpose of acquiring and extending the working of the Pittsburg gold mine in Grass Valley district, which has been for years one of the most active centers of quartz mining in California. In fact, there is perhaps no district in the world where gold-quartz mining has been prosecuted with such continued and unvarying success as in Grass Valley."

"In the immediate vicinity of the Pittsburg mine are some of the oldest and most productive gold mines of the State, including the Idaho, the Eureka and the Empire mines, whose joint production of gold has amounted to over \$10,000,000. The Idaho, which is considered to be the richest mine in California, is at a distance of less than 1000 yards from the Pittsburg, the vein of which is believed to be the same as that of the Idaho and Empire mines."

"The character, for depth and permanence of the quartz veins in this district, is conclusively established, some of the mines above-named having attained a depth of 2500 feet, and the quartz which they are now getting being better than that which came from the upper levels."

"The Pittsburg mine is easy of access by rail from San Francisco, the branch road from Colfax on the Central Pacific road to Nevada City passing through the company's property and affording great facilities for the transportation of machinery and supplies, as there is a siding at which trains can load and discharge within 350 yards of the main shaft. The South Yuba canal passes near the works and furnishes the greater portion of the motive-power for the mine and mill, and the water supplies and facilities are unusually good and abundant. The natural and artificial surroundings of the property are extremely favorable, and the climate is excellent, the altitude being about 4000 feet above the sea level."

"The amount of gold already produced by this mine has exceeded \$1,200,000. A considerable portion of this amount has been absorbed by deadwork in sinking shafts, running levels, and by improvements of every description in the way of machinery for hoisting and pumping, after payment for which about one-half of the amount of gold raised remained as profit."

"There is a 10-stamp mill on the property which it is proposed to enlarge to 20 stamps, as its present capacity is insufficient for the available output, as there is now exposed to view and ready for extraction 11,000 tons of pay quartz, worth £66,000 gross. The hoisting and pumping machinery is in perfect order. The mill and pumping machinery are driven by water, but steam power can at any time be used, the timber on the property being abundant for all fuel purposes. There are also on the property all necessary buildings, including a superintendent's house and convenient offices."

"The contract for purchase, dated 15th March, 1885, is made between Henry Jarvis Alfred of the one part, and James Nicoll, as trustee for the company, of the other part, and recites an agreement, dated 9th February, 1885, made between the Pittsburg Gold Mining Co. of the one part, and the said Henry Jarvis Alfred of the other part."

"The vendor will provide all the preliminary expenses of the formation and bringing out of the company, and the issue of its capital, and he has reserved to himself the right to enter into and has entered into arrangements with third parties for this purpose, which do not, however, affect the company, and to which it is not party. As these arrangements may, technically, be contracts within the meaning of S. c. 33 of the Companies' Act, 1867, applicants for shares shall be deemed to have notice thereof, and to have waived any fuller compliance with such section with reference thereto."

The Grass Valley Tidings notes three incorrect assertions. First, that the Pittsburg is at a distance less than 1000 yards from the Idaho vein. It is something more than that distance. Second, some of the mines around here are spoken of as having attained a depth of 2500 feet; 1800 feet is about right. Third, the joint production of the mines named is more like \$25,000,000.

PROTESTS are going up all along the line against the granting of the petition which has been sent to the Government Fish Commission to stock Oregon waters with catfish.

TWENTY of the Copper Queen Company's miners at Bisbee have been discharged for gambling.

## Copper in Alaska.

From Lieutenant Henry P. Allen's report of his explorations up the Copper river we learn the following interesting facts about the country:

Copper river is a stream of considerable size, very swift and difficult of ascent in boats. It is not confined to one channel, thus forming many large islands, and its volume of water is so great that the stream spreads over nearly the entire bottom of the valley. Along its banks are large gravel bars, and the country throughout is marked with extensive glacial deposits. After passing the glaciers, which lie about 40 miles back from the coast, the climate in summer is dry and warm, and in the winter it is mild and no great depth of snow falls. The mountain ranges are very high and are marked by many lofty peaks, the highest of which is Mt. Wrangle, which is now considered the highest mountain in North America. But a few years ago Mt. Wrangle was an active volcano, breathing out flames and molten lava, and she now sends out clouds of smoke and vapors. The mountain is situated northeast of Mt. St. Elias and about 200 miles back from the coast, and in the very heart of the mineral regions of Alaska.

In regard to the mineral resources of that section, Lieutenant Allen speaks as follows:

"The minerals of Copper river have long been a source of speculation, owing to pieces of pure copper, knives and bullets of the same metal having been brought down to the coast by the natives. Some of the specimens are supposed to be associated with silver, and in fact I have heard of some brought down which assayed in Boston \$80 per ton in silver and 60 per cent of copper. Nicolai's house, situated on the Chittystone, the south branch of the Copper, and six miles above the mouth of the Chittito river, is supposed to be in the heart of the mineral region, and by him we were shown a vein near his house which at that season of the year (April) was above the snow line. He gave us, however, some specimens which proved to be bornite, a sulphur of copper and iron. He said the pure copper was on the Chittito river, between his house and the central branch of the Chittitna, as well as on other tributaries of the same. He had bullets of pure copper in his possession. We found specimens of hornite also in the hands of the natives at Nandell's, just across the divide from the head of Copper and on the headwaters of the Tananah. The waters of the Chittito (Copper Water) are of a deep yellow color from flowing through beds of copper, and the natives informed me that the waters were poisonous and that salmon would not ascend the stream. Its length is probably not over 15 miles. At one place on the main Copper, on an island, were springs so strongly impregnated with mineral that their water could not be drunk. Even a sip left for a long time a disagreeable taste. In ascending the Copper river it was observed that the banks were a green hornblende rock, intersected by mineral-bearing quartz veins. Up further these gave way to a green basalt, which had at its northern end a fine quality of slate that split easily into laminae transversely to its bed. A few miles from the mouth of the Chittitna it cuts through bluffs of beautiful greenstone, intersected by white veins, which appeared to be limestone. The pebbles and boulders in this riverbed are much discolored by copper stains, but not to such a remarkable degree as those of its tributary, the Chittystone. The mountains around the headwaters of the latter are sandstone and felspathic granite. A feature of some of the high banks of the Upper Copper is the strata of boulders many feet below the surface."

—*Alaska Free Press.*

## Prospecting in Nevada.

The Belmont *Courier* says: This is the season when the prospectors go into the mountains in search of the precious metals. The indications of hidden wealth in the Jefferson, Belmont, Spanish Belt, San Antonio, Monitor and Toiyabe ranges are numerous and sufficiently strong in character to encourage experienced prospectors to persevere in their efforts to discover new and productive ledges carrying gold and silver. The outcrops of these ranges are being more closely examined for indications of the precious metals than ever before, and it would not be surprising to learn that veins which heretofore had been considered worthless were worthy the attention of capital, and might be made producers of hullion. Veins carrying gold and silver are not as plentiful and easily found as the Eastern enemies of the white metal would have the world generally believe. There are no hardships that prospectors will not endure in their search for the hidden treasures of the earth that, when discovered, do them very little good, for it is a well-known fact that the grub-stakers and small operators get the cream of the results of their discoveries. To the hardy prospectors is due the opening of new countries and districts to the less venturesome people of the world, and hard knocks and tough times are generally their greatest reward. The world profits by their discoveries, populous towns spring into existence as if by enchantment, and the prospectors (hewled by the motley crowd their discoveries have called forth) strike out for some undiscovered country that fable says is rich in the precious metals.

Enough prospecting has been done in this section of Nye to convince any one who knows anything of mining that there is no better nor more mineralized country anywhere. Capital properly expended would place all the mines of Philadelphia district on a paying basis, and the same may be said of the mines of Jefferson and San Antonio districts. The Barcelona mine at Spanish Belt is opening up splendidly, and shows immense quantities of fine milling ore that will be worked in the Monitor-Belmont mill this summer. John Griffin is uncovering a fine body of ore in the El Dorado North, and James Laity's mine improves as he goes down on the vein, which is now five feet thick—all good milling ore. Wherever work is properly prosecuted in the mines of this section they pay handsome returns to their operators, and prospectors find many worse ranges to hunt new discoveries in than those of Nye county.

## A Mining-Stock Boom.

Lively Speculation in Wildcats in the Colonies.

Great excitement and lively speculation in mining shares is reported from Melbourne, Sydney and Adelaide. The Sydney *Herald* says of the boom: "It does not require much prophetic instinct to say that the silver boom in Australia will be certain to end in disaster to many. Any one who has lived a quarter of a century and seen the fate of the various mining booms within that time could hardly predict any other future for the speculative mining business which has now been in operation with fluctuating activity since the beginning of the year. We have had gold, tin and copper mining booms which have brought disaster to numbers. Even the silver-mining boom at Sunny Corner two or three years ago brought loss to many, and gain to few—the loss far exceeding the gain. Therefore, in predicting that the present silver-mining boom in Australia will end in disaster, the English press has reasoned upon the experience of the past, and the conclusion arrived at is one that has already been come to by many in Australia, especially by those who have observed the operations of the Mining Exchange with its exciting whirlpool, already contracting its circles and bringing its victims nearer the vortex. The values are determined on the Stock Exchange, not in the mines; and the enhanced prices of properties which have not yet returned a dividend have made the fortunes of a good many clever and lucky speculators in Sydney, Melbourne and Adelaide. Whether present holders will repeat their experience remains to be proved.

"The mining mania which has now possession of the British and Australian public has come at a time when people have become tired of stagnation in trade and small profits. With diminishing income from investments, where it has been possible to find the means of investment, people naturally gave more attention to the alluring prospects of mining promoters. There can be little objection to the expenditure of some portion of the realized wealth in the development of mining enterprise, provided the outlay be in exploring land which gives fair indications of auriferous treasure. Otherwise, the money spent is but senseless diminution of realized wealth."

BOSTON BAR.—Two men are at present engaged in running a tunnel under the mountain at Boston Bar in search of the original channel of the Yuba river, which is supposed to have been covered up in ancient times by a great landslide at that place. The tunnel is now nearly 200 feet into the mountain, and the formation upon which the men are at work is a soft, gravelly deposit, somewhat mixed with clay and small boulders. The longed-for channel has not been found, but the projectors of the scheme are hopeful, and will continue the work until they strike a bonanza or are assured of failure. They report having discovered four places in the Yuba river channel below Bridgeport which will pay largely for working. It is to be hoped that the report is a true one. The Yuba, in early days, yielded enormous fortunes at this point, and it may be made to yield still more, although it is now well filled with debris far above the original high-water mark. It is a common practice with the Indians of Dry creek, and the vicinity of the Oregon house, to pan out small quantities of gold from the sands of Boston Bar, and if these people can make money, even in small amounts, it is reasonable to suppose that more thorough mining will yield a better result in proportion to the means employed.—*Nevada Herald.*

CON. CALIFORNIA AND VIRGINIA.—The total yield of the Con. California and Virginia mine since the date of the ore discovery in October, 1885, to May, 1888, was \$5,941,590, of which \$2,511,826 was gold and \$3,429,763 was silver. Of this total of \$1,728,000 in coin was disbursed to shareholders in 16 consecutive monthly dividends of 50 cents per share, omitting the month of November, 1887. The operating expenses of the Con. California and Virginia mine in April were about \$199,656, divided as follows: Reduction of ore, \$97,251; Suto tunnel royalty, \$13,873; transportation of ore to Carson River mill, \$13,873; handling, \$470 46; salaries and miners' wages, \$46,833 50; mine supplies, \$23,986 37; hoisting, \$33,70 40. The company carry over in hullion and cash to the May account a balance of about \$105,000, gold-coin value.

## Superstitions of Miners.

"I do not know of a more superstitious class of men in the world than miners. Their strange fancies and beliefs are at least called superstition, but by miners whose lives have often been saved by timely premonitions of impending danger, they are as sacred as a religion. I could give facts to substantiate my assertions."

The speaker was a veteran mining man who has spent the greater part of his life among the mines of California and Arizona. At the request of an *Altus* reporter, who had become interested in the subject, the miner continued, and related some tales of his own personal experiences.

"No one," he said, "treated the peculiar beliefs of the miner with more derision than myself before I became one of them. A few years' experience, however, taught me, the skeptic, to hold these so-called superstitions very sacred. Would you like to hear how my life was first saved through a feeling of danger which I fortunately heeded? Very well. You must know that in 1879, after the mines in the vicinity of Bodie had been pronounced a failure, there was a great rush for the gold and silver producing districts of Arizona. I lost no time in beginning a prospecting tour in the new, and what appeared to me then inexhaustible, territory. I was fortunate enough to soon strike a rich lead, and, with the assistance of an intelligent young man whom I had taken into partnership, began operations. We dug into the bank of a gully, said to be a wonderfully rich spot. The work progressed favorably, and in a week our excavations extended in some 15 feet from the mouth. Not knowing that our mine would be permanent, little attention was paid to putting in the proper timbers for safety. Well, I was working steadily ahead with pick and shovel one afternoon after my partner had departed to prepare supper at our cabin, when I experienced a most peculiar feeling. My whole body seemed to turn as cold as ice, and my hands trembled so violently that I could not wield the pick. After trembling for a few seconds, a voice of thunder seemed to sound in my ears: 'Run for your life; the mine is caving!' I obeyed this strange and unaccountable warning or premonition, and never ran faster in my life as I started for the mouth of our little mine. An instant after I reached the open air the roof caved in and the mine was completely filled with the falling rocks and dirt. Was this a premonition, superstition or imagination? I firmly believe that the timely warning I received was the voice of the spirit that watches over the miners and saves thousands from violent deaths. Laugh if you will, but I can account for it in no other way. In the case I have cited, an instant's delay or hesitation would have caused my life to come to a terrible end. You may be sure that after that experience I never failed to take advantage of these strange warnings; and I am firmly convinced that they have saved my life on at least half a dozen occasions.

"A peculiar circumstance of the case I have told you is that on the night previous to the caving of the mine my partner dreamed that it was going to cave in. He did not tell me of the dream for fear that I would have nothing more to do with the mine. After a little more experience he also came to believe in these warnings as firmly as I do.

"I know of a rich mine in the San Gabriel mountains, Los Angeles county, that has caused the death of every man who tried to carry ore away from it. You may call this superstition also, but there are a dozen miners besides myself who know of the millions that could be taken from this mine and yet are afraid to go near it. Some half a dozen men had been killed by caves, etc., when my partner and I arrived after a run of six months of hard luck in Arizona. We worked around a few days and took out some specimens of as beautiful gold quartz as man ever laid eyes upon. My partner desired to go to San Francisco to purchase tools and material for developing the mine. He went and took several pieces of ore for assay with him. The ore was found to be worth about \$1000 a ton. In the meantime I remained in Los Angeles awaiting my partner's return. The next I heard of him was that he had been stricken with leprosy and died a horrible death in the pesthouse. It is hardly necessary to state that I never returned to the mine. The certainty that I also would come to my death in short order prevents me from doing so."

MT. DIABLO COAL.—The Martinez *Gazette* says: We are informed that the company now engaged in working the coal leads at Somersville intend operating in the near future on a more extensive scale. Our informant says that it is probably the intention to get at the large vein of coal known to be lying in the flat below Sam Brown's store, by means of the old Independence shaft, now down a depth of 700 or more feet. This shaft was abandoned years ago on account of the vast amount of water then flowing in from the vein, and it is thought by putting up heavy pumping machinery this obstacle can be overcome, and the mine kept dry enough to enable work to be pushed ahead. This shaft will probably be driven down still further, and if such should prove to be the case, we predict lively times for Somersville, as well as a direct benefit for the entire county. Sheriff Rankin has been working the mines at

Somersville for the past six months on a small scale, cautiously carrying on the work, and if the opening up of the Independence shaft is to at last be brought about, it is through his excellent management and thorough understanding of the business which he has undertaken. We sincerely hope the rumor is true, for with the present high prices of fuel, the mines surely ought to be made to pay handsomely, and if the company decide to sink on the large vein, it will prove an industry for Contra Costa productive of a vast amount of benefit to a large number of laborers.

## The Outlook at Wood River.

"Well, sir, I never saw a better outlook since I have been on Wood river," said one of the pioneer business men to a Wood River *Times* reporter. "The Minnie Moore is a mine and promises to become a world-wonder; the Queen of the Hills and Relief promise to prove nearly as good; Lookout Mountain shows three or four promising prospects that have already shipped. On the East Fork of Wood river the Pride of Idaho has been taken hold of by a company that has the means required to test it; the North Star—across the gulch—is a mine; the Triumph group, hard by, shows a mountain of concentrating ore; and there are half a dozen other producers of shipping ore in the same direction. In the Parker-Elkhorn gulch the workings have demonstrated the existence of a strong, well-defined, highly-mineralized vein, which must carry an enormous ore body, and three groups in that vicinity are likely to change hands soon. Boulder is coming to the front this year with large shipments of high-grade ore. Galena and Sawtooth will evidently be livelier than for years. At Vienna the Vienna Co. is to resume work with a capital of \$60,000. Beyond are the Seafoam, Sheep Mountain, Alton and other districts whose outlets are Wood river.

"At Atlanta and Silver Mountain fully 300 miners will be at work this summer; Rocky Bar will at least keep up her end, with 300 to 500 men at steady work; Pine Grove will probably follow suit with a couple of hundred, and the placer mines along the Snake river will, as usual, employ about 100. Out last river way, if the Big Copper group sale goes, and work on the big irrigating ditch is pushed vigorously by the Butte company which has taken hold, there will be lively times there, and Houston may become a town and the ranchers of the valley find a home market for their products. On the Carbonate Belt and at Era, the prospects are certainly flattering, a few claims even being put 'on velvet' by means of shipments to the Nicholia smelter. At Muldoon the Black Spar Co. will doubtless show up a good mine, while the Little Wood River Mining and Smelting Co. must, it seems to me, do something with its valuable mines and slag dump.

"This brings me back to the River. First of all there is the Gold Belt. If that could be started successfully, the whole River would prosper. It would even have a genuine boom, and on merit. I understand that the experts who were here recently are coming back, the bond having been extended 30 days. That itself is good. They may not buy, but their return will speak very loudly for the merit of the property, and such a whopping big price, too! Why, you remember that everybody, almost, used to laugh at you and the *Times* for saying so much about the Gold Belt. They thought there was nothing in it. Now they begin to think differently—and so does capital. It may be a big proposition, but capital will be found to take hold before very long, no matter how much is required.

"Next in importance to the Cold Belt is Smoky, the value of whose mines no one can approximate, but that there are mines there no one can deny. Look at the Silver Star, Smoky Bullion, Carrie Leonard, King of the West, Stormy-Glory, Tyrannis, Dollarhide group, and other properties that have yielded more or less, but every one of which has paid a good profit from the grass roots, besides paying for development. To be sure the King Co. has spent about \$35,000 opening up its claim, but that has made a mine, and now all it has to do is to take out the ore and declare dividends. It could have paid as it went, but it would have taken years to open it up.

"Der creek shows more ore than ever before. Look at the Emery, War Dance, Red Cloud, and others. The Nay Aug will be a mine long before the \$30,000 of working capital provided shall be exhausted. Bullion is the only cloud in our sky—and it is a dark one, yet it has a silver lining. I understand that the Durango boys expect to be made more than whole before fall, while the Idahoan, now that the owners—or, rather, some of the owners, for they were not all willing—have failed to sell it to English parties who did not seem to want it badly, anyway, since they did not even come to see it, will doubtless soon be operated again. The Red Elephant, too, shows ore, and with muscle and some money may be made a mine."

THE Kootenai Railway Co., which has just been chartered by the British Columbian Government, receives a grant of 200,000 acres of land, to be selected by them in the Kootenai district. The road is to be started in three months and completed in two years. It will connect Lake Kootenai with steamers on the Columbia for the transportation of goods, ore, etc., to the Canadian Pacific at Revelstoke.

## Passing Events.

Active steps are being taken to properly develop the tin ore deposits in San Bernardino county, this State. These deposits have long been known, but for various reasons no active operations have heretofore been carried on.

In several places in this State, electric power is to be utilized in driving mining machinery. A company to furnish this power has been organized in Grass Valley. In San Francisco and other large cities, the use of the power is gradually increasing. Under certain circumstances it is a great improvement over direct steam power.

The local foundries and machine-shops are now quite busy with spring orders. More or less mining machinery is made here at all seasons, but at this time of the year the orders in this direction usually increase.

**THE LICK OBSERVATORY.**—We expect to give in the next number of the PRESS a complete description of the Lick Observatory with engravings of the buildings, instruments, etc. The observatory will very shortly be delivered to the University by the Lick Trustees. Our description will embrace many details of interest to scientists and the public generally.

At the last meeting of the Academy of Sciences, a paper by Gustav Eisen on "Antiquities of Guatemala" was read. Illustrations with stereopticon views accompanied the paper.

## Our Tin Mines.

The California Mines to be Opened.

The Eastern mining papers are from time to time filled with statements of the wonderful discoveries of tin ore in the Black Hills and in proximity to Rapid City, in Dakota. We hope that the results may justify the statements, for the United States is dependant entirely for the vast quantity of tin consumed here upon the foreign supply. This cost is supplied with tin almost entirely from Australia, while the balance of the United States is almost entirely supplied with tin and the whole country with tin plate or sheets from England. We do not know the value of the latter, but in 1887 the value of tin here alone imported into this country was \$6,927,696. That the value of sheet or plate tin was largely in excess of this sum cannot be doubted, and we believe that the total value of this metal and the articles manufactured from it imported will exceed \$15,000,000. It is, therefore, a matter of much importance to this country if we can, out of our own mines, meet the requirements of this demand which is constantly increasing.

Most of our readers, and in fact a very large majority of our people, are not aware that in the State of California is a deposit of tin ore unequalled in the world. Nature has been, as we all know, most prodigal in her gifts of the royal metal (although our courts have closed the largest source of supply of that metal, by closing the most extensive permanent and productive mines in the world), and she has also supplied us most bountifully with almost every useful metal; but until quite recently it was not generally known that she had also supplied us with tin ore to an unlimited extent.

From time to time vague rumors during the past 20 years have been published as to the finding of tin in San Bernardino county on what has been known, and is still known, as the Rancho Sobrante de San Jacinto, belonging to the San Jacinto Tin Co., a corporation organized in this city in 1868, and still in existence here. A part of the City of Riverside, as also of Arlington, is situated upon a portion of this ranch, which was patented in 1868 to an extent of about 50,000 acres of land. Upon the western portion of this grant is a range of mountains called the Temescal, and in this range, in proximity to the western limit, is what is called the "Tin belt." It is about seven miles long by two miles in width, and within this district there has been located some 200 mining claims upon as many different ledges.

When the San Jacinto Tin Co. purchased the Mexican grant of 11 leagues in 1868, it took two days, with a pair of horses and wagon to drive from San Pedro, the nearest steamer landing, to the ranch, a distance of about 100 miles. But the tin company went to work upon one location known as the Cajalco mine, which had been prospected a little by early locators, the prominent croppings assayed only one per cent. Shafts were sunk upon this vein which increased in richness in depth, until a depth of 150 or 200 feet was reached. An adit was run on the first level, and some cross-cuts were made which developed a powerful and rich vein. At the bottom of the main shaft a tunnel or drift was run on the vein for some 400 feet, developing an abundance of ore of high grade. Quite a quantity of ore was sent to this city, and over a ton of tin bars of exceeding purity was smelted from it. Tin plate was also made here, and the whole product was exhibited at the Mechanics' Fair in this city, obtaining the gold medal. As there was no fuel near the mines, and no water except in the mine, and as it cost largely for supplies and transportation of the ores, the company closed the mine, concluding to wait until cheaper transportation, labor and material could be had. The construction of the Southern Pacific railroad again brought the working of the mine into prominence, as at Colton it was only about 20 miles from the mine, and the company had serious thoughts of again opening the works, when, through the representation of a person claiming some mining locations there, the Attorney-General of the U. S. Government was persuaded to allow its name to be used in a suit to set aside the patent. This proceeding of course suspended all further work at the mine until that suit was finally decided in the U. S. Supreme Court in Washington some three or four weeks since.

During the long years of delay in contesting

this and other suits, railroads had been constructed along two sides of the ranch, one of which is within some four or five miles only of the Cajalco mine, and another one is now being constructed which runs within a short distance of it. A coal mine has also been opened a few miles from it. Water by means of artesian wells has also been found in abundance in Temescal valley, close to the mine. Irrigation has been promoted and population has poured into the section adjacent to the ranch line. Reservoirs have been located, and in fact the whole face of the country has been changed. The finest citrus fruits raised in the State come from there, and supplies of all kinds are cheap and abundant.

Pending the decision of the U. S. Supreme Court, negotiations were opened with parties in the East and in England for sale of the property, depending upon decision of the Supreme Court and an examination of the property. An expert has been sent out from Cornwall. The mine has been cleared of water and the accumulation of 20 years of idleness. Examinations now being made have more than confirmed the statements of the company as to its extent and richness. Many other locations have also recently been made and prospected with the unvarying result of ascertaining that they carry in the croppings from 1 to 15 per cent of tin.

The Cajalco mine carries ore in large bodies, one vein of solid ore at its widest being about eight feet. It is exceptionally rich in tin, carrying it in some places as high as 50 per cent. The metal is of exceptional purity, and 10 locations of these veins within 1000 feet of the Cajalco have been recently prospected. It is believed that there is tin enough in that tin belt of 14 square miles to supply this coast with great ease, as well as the United States. Such ore as is being extracted now to send to England is very rarely or never found in any similar mine in the world. Much of it carries tin up to 50 per cent, and as the tin concentrates can only be carried up to 78 per cent of pure tin even in Cornwall, it can readily be seen how rich these ores are.

If the parties proposing to purchase the property do so—as there is every probability of doing, and as they are gentlemen of large wealth, familiar with tin mining and manufacture, and largely interested in it in England—they intend to erect large works near the mine, not only for making tin bars, but to manufacture tin plates to supply this coast west of the Rocky mountains, which within itself will be quite enough for one concern to attend to, and we expect to see within a limited space of time the tin mining and manufacturing industry among the prominent industries of our State. One thing connected with this mining industry is strongly in its favor. The mines are so situated that our United States Circuit Court judge cannot by any possible construction of his debris views close them, because there is no possibility or probability of the tailings or debris from them getting into the Yuba, American, Feather or Sacramento rivers, and if by any possibility some of them should get into the Santa Ana river, it is not probable that our anti-mining judge will extend his legal arm so far as to close the mines for fear some of the tailings might get into the Pacific ocean and find a final resting-place on the bottom of it.

THE Trustees of the Mt. Diablo Mining Company have declared a dividend of 20c per share, payable May 24th. This mine is capitalized into 50,000 shares of \$100 each. There have been three assessments, the last one being \$2 per share, levied in June, 1880, and the three amounting to \$137,500. There have been seven dividends paid, the last one having been disbursed in July, 1885. These amounted to \$80,000. For nearly three years the mine has been unproductive, yet has been managed with little expense to stockholders. The dividend just declared amounts to \$10,000. But for the low price of silver there would be a much larger surplus from month to month for the dividend account.

It is stated that a company is about to start electric works on Deer creek, below Nevada City, to be run by water-power. It will be sent to those mines in Grass Valley and around Nevada City that are not in reach of water-power. This electric power, generated by water-wheels and dynamos, is next in cheapness to water-power itself. Several mining companies agree to take the electricity.

## Swindling Patent Concerns.

The police of San Francisco have shown up the Globe Patent Company of this city as a swindling concern, which has been taking the money of inventors on false pretenses. Letters have been received from many persons, mainly from the East, making complaints about the company. An investigation showed that none of the firms and banks whose names were used for reference had been consulted, and the names of even some of the officers were used without their consent. The company had advertised itself by circulars as "the largest and most reliable patent-selling company in America, with unlimited resources, the best local and traveling salesmen and corresponding agencies in Chicago, Washington, New York, London, Liverpool, Glasgow, Berlin and Hongkong." They had written to inventors, and by specious pleas had induced them to forward money. The usual thing, after agreeing to sell a patent, was to ask for \$15 or \$18 "to make a search in the Patent Office." Of course, the search was not made, and the inventor heard nothing more of the matter. If he inquired he was told a tale had not yet been made.

This is not the first time that concerns of a similar nature have been started in this city. Chief Crowley says that the chief difficulty in obtaining evidence against the men who run this and similar concerns, is that they send all their circulars East, and the victims cannot be found as the sums realized from them are so small that they do not care to make any complaint. Still, people on this coast are taken in also, and, moreover, there are other establishments in Eastern cities, which reach out for Pacific Coast inventors.

As soon as an inventor receives his patent, and the fact is published in the Patent Office Gazette, the patentee is flooded with a lot of circulars sent by mail. These are from patent agents who want to get future business, and from patent agencies that want to sell the patent rights, or rather make the inventor believe they want to.

Of course, some of these patent-selling agencies are bona fide concerns doing a legitimate business. But among them are others of a similar character to the one just exposed in this city. They first want some kind of a fee for advertising, printing circulars, etc., and nothing more comes of it.

In such cases the amount is comparatively so small that a man prefers to bear his loss rather than to go to any further trouble. In this way these unscrupulous agents reap quite a harvest. All they need is a desk, letter-heads and postage stamps to start in business. Some of them ask for models, and others only for drawings, but some sort of fee is required before negotiations go very far.

It is just as well for inventors to inquire into the standing of the firms who send circulars to them before paying out any money. It may be noted in this connection that few patent solicitors of standing or respectability combine a patent-selling agency with their business. Negotiating the sale of patents is a separate business entirely from that of obtaining patents for inventors. There are frauds in both lines of business, and people who are about to obtain patents should be sure that the firms they deal with are of respectable character and reputation.

It is stated that the Livermore Coal Company, the mines of which were recently described in the PRESS, is about to begin operations on an extensive scale. It has purchased coal-bunkers, railroad tracks and cars, and will receive an engine and boiler shortly. One incline is down 130 feet, and they have struck a vein of coal four and a half feet thick, which is excelled by no other on this coast except Wellington. The company proposes in three months to be able to ship 100 tons of coal a day.

THE Senate Committee on Mining has decided to report favorably, with some modifications, the bill submitting to the Court of Claims for adjudication the title of Wm. McGarrahan to the mineral interests of the Rancho Panoche Grande in California. The minority report will also be made.

MR. J. C. FLOOD, one of the "bonanza firm," has resigned as director of the Nevada bank and has left for Europe in order to try and recover his health.

## Buck-Scrapers for Earthwork.

In the engineering features of the construction of ditches, canals, levees, etc., in mining and irrigation enterprises in California, the question of the best method of moving masses of earth is a very important one. In a paper read before the Technical Society of the Pacific Coast by George J. Specht, he presented some very interesting notes on earthwork, relating specially to the enterprise of the Sutter County Land Co., which owns several thousand acres of land in Sutter county, about 16 miles south of Marysville, 8 miles east of the Sacramento river and 6 miles west of the Feather river. This land occupies nearly the center of the Sutter basin, which plays a very important part in the drainage of the northern part of the State, serving during periods of flood as a relief basin to the Sacramento and Feather rivers, whose waters, owing to insufficient capacity of the river channels, are backed up from the lower end of the basin.

These levees are not exposed to the constant wash of a river current, their only service is to protect the land against the water flowing into the Sutter basin at periods of flood, when the basin forms a large inland lake. The levees built in this section of the country are constructed usually with an outside slope of 3:1 or 4:1, and an inner slope of 1.5:1 or 2:1, and a top width of from 6 to 10 feet. The earth which is used to form the embankment is taken from both sides of the levee, and is put in place by means of scrapers.

The Sutter County Land Company's levee, as built at present, is 6' wide on top, with slopes of 3:1 on the inside, and 4:1 on the outside; its height varies from 6 feet to 14.5'. This type will probably be changed gradually to a 10' wide crest, with slopes 6:1 outside, and 2:1 inside.

In the construction of the levee just referred to, buck-scrapers and a few dump-scrapers were used. The buck-scrapers were 8 feet long and 23 inches wide, from outside to outside. The other dimensions can be seen in Sketch No. 1. Four horses are required to move one scraper. The driver stands on the end of the tail-board, pressing by his weight the edge of the scraper upon, and into the ground. This weight was not properly applied in the scrapers used, and two additional men were required to weight them down during the time of filling. The horses pulling ahead, earth accumulates in front of the scraper, and it is moved and deposited where required. To dump the earth, the driver steps off the tail-board, and the forward pull of the horses turns the scraper on its lower edge and empties it. The scraper then runs on its side-boards over the deposited earth to the other side of the levee and into the borrow pit. The side-boards are protected by flat iron  $\frac{1}{2}$  inch thick. In the pit the driver takes hold of the tail-board, presses it down upon the ground and steps upon it, and again proceeds as above described.

A certain number of scrapers, varying according to the requirements, were worked in one gang, continuously moving from one side of the levee to the other, an operation by which the earth is well packed. The first load is taken near the foot of the slope, and the circuit enlarged with each trip until that particular section of the pit is scraped clean. In order that the work may proceed without interruption, it is absolutely necessary to have sufficient ground plowed ahead of the scraper gangs.

The capacity of one buck-scraper during the construction of the Sutter County Land Company's levee was as follows: Seventy thousand cubic yards were removed in 1277 scraper days, or one scraper moved per day about 55 cubic yards; 294,000 cubic yards were moved in 3249 scraper days, or one scraper moved per day 90.5 cubic yards.

The small capacity in the first case was due to the inexperience of the contractor, as well as of the teamsters, and to the fact that it was an old levee, partly finished the year before, which necessitated a higher pull. The total work done was 364,000 cubic yards, moved in 4526 days, or one scraper moved per day 80.5 cubic yards on an average. The cost varied from 9.63 to 11.4 cents per cubic yard.

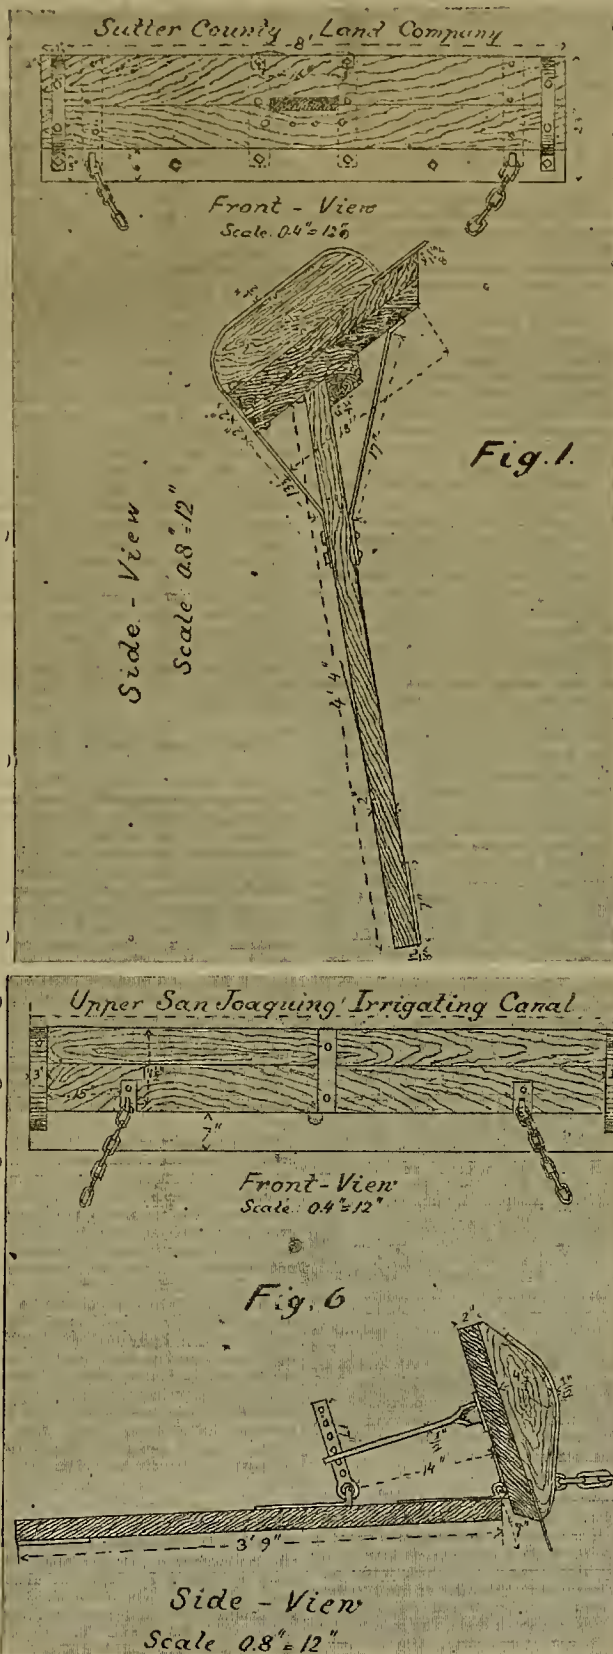

Mr. Specht in his paper gives a number of sketches showing sections of the levee. As, however, we only desire in this article to give some details of the work of the scrapers, we omit the sketches of the levees and canals and

only give Figs. 1 and 6, showing the appliances referred to.

He gives in his paper a sketch of the scraper used at the Upper San Joaquin irrigating canal in Fresno county several years ago. The canal runs for several miles along a high bluff, which is apparently the shore of the old river channel. This bluff, which is composed of sediment, sand and hardpan, 2:1 to 1.5:1 for about 75 per cent of its length. There is no rock, and this hardpan occurs in strata of from a few inches to one foot in thickness, separated by quicksand. The

1.3 cubic yards. All the conditions were very favorable. This is the average of 1000 observations. The maximum load observed was 1.64 cubic yards. Later observations of the same pieces of work showed an average daily capacity of one scraper of 128 cubic yards. The daily expenses of each buck-scraper was \$4.65. The average capacity of one scraper per day was 131 cubic yards.

The California Chemical Works, owned by John Reynolds of this city, and the California

BUCK-SCRAPERS FOR EXCAVATING, ETC.

hardpan is sufficiently solid to stand with a slope of 0.5:1, while the underlying sand rests only at 2:1 or 3:1. The work of excavation and building lateral embankments was done by buck-scrapers and dump-scrapers. The dimensions of the buck-scraper are shown in Fig. 6.

As all the loads had to be moved down hill, the work performed daily by one scraper was large. Observations showed that, with a total length of the round trip of 400' and a vertical distance of 40', in 9 actual working hours one scraper made 95 round trips, carrying at each

Chemical Co., of which Wm. T. Coleman & Co. were proprietors, are separate and distinct institutions. Mr. Reynolds has been in business for some 22 years and still continues.

THE U. S. sub-Treasury at San Francisco now contains \$30,000,000 in gold, \$25,000,000 in silver and \$1,000,000 in notes and currency.

THE machinery of the Berriman Con. or Dromedary mine at Grasa Valley is to be run by electricity.

## Foundry Notes.

The steam schooner Point Loma, the machinery of which was built by the Fulton Iron Works of this city, recently made a trip from Navarro river, Mendocino county, to San Diego in 48 hours, carrying 14,250 railroad ties. This vessel has triple-compound engines. There are two high-pressure cylinders 10 inches in diameter, intermediates 22 $\frac{1}{2}$  inches, and low-pressure cylinder 36-inch diameter. The stroke is 24 inches. The boiler for this engine is 10 feet 9 inches in diameter and 10 feet long; the shell is made of one-inch steel.

The new steam schooner Del Norte, which had a trial trip last week, has compound engines with 14 and 28-inch cylinders. Her boiler is 10 feet diameter by 9 feet 6 inches long, with two corrugated furnaces.

The trial trip of the Silver Spring was made on Wednesday, and was very satisfactory. She was built by George Boole for J. S. Higgins, C. A. Hooper and others. She is 125 feet on the keel, and 135 feet in length over all. She is 31 feet on the beam and has a depth of hold of 9 $\frac{1}{2}$  feet. Her net tonnage is 194 tons and she has a carrying capacity of 290,000 feet of lumber. Her machinery was put in by the Fulton Iron Works. She has compound engines, with 12x24 cylinders with a 20-inch stroke. Her wheel is 7 feet 9 inches in diameter. The steamer was built for the coasting trade, and she will make her first trip to Salmon, where she will load with railroad ties for San Diego.

Another steam schooner, to be called the National City will have her trial trip in a few days. The machinery is a duplicate of that in the Point Loma, the dimensions of which are given above.

The Risdon Iron Works have commenced extensive repairs on the U. S. Revenue steamer Corwin.

The Pacific Iron Works are introducing on this coast the Gates ore-crusher, described and illustrated in the PRESS of April 21st.

The San Francisco Tool Company are rapidly enlarging their plant for furnishing electric-power. This enterprise was started on a small scale, but has proved so satisfactory that there is great demand for the power. The company is now building, in addition to its other engines, a 250-horse power to be used for running dynamos. The Keith dynamos and motors are used.

The Hendy Machine Works are building a complete 20-stamp gold-concentrating mill for the Boaz gold mine, 60 miles from Phoenix, Arizona. This mine is owned by parties in Fort Worth, Texas.

They have arranged for putting in the Dodge rope-transmission system, displacing belts in F. A. Hihn's saw-mill at Santa Cruz.

Have just finished putting in the power of the new works of the California Door Company at 16th street, Oakland. The Hendy Works are likely to receive orders for the power for an electric-light plant at Seattle, W. T. They are also shipping a number of Triumph concentrators to Nicola, B. C.

LOWER CALIFORNIA MINES.—This is the way the Oceanside Journal comes down on the last gold excitement story emanating from San Diego: "It is surprising how easy it is for some of the San Diego papers to lie under a false impression. An old mining claim whose existence has been known here for years, and always known to contain some good ore, has been discovered, and the pretext for whole columns of scare heads and elaborate articles by the papers referred to. The statements like the following: 'The people are hurrying about half-crazy with excitement' are all hosh, and any one who comes here expecting to find either chunks of gold or great excitement, or any excitement at all, will be sadly disappointed."

IN the description of Mr. Attwood's micro-meters for measuring quartz screens, published in the PRESS recently, it was stated that in a No. 8 slot screen the diameter of the slot is two-hundredths of an inch. It should read one-hundredth of an inch.

THE Carson Mint is overrun with work nowadays, plenty of bullion coming into the refinery all the time. One hundred thousand ounces were melted last week.

THE Silver King Mining Co. of Arizona will hereafter use crude petroleum, freighted from Los Angeles, for fuel to run its engines.

## MECHANICAL PROGRESS.

## Health and Efficiency in Work.

Nearly all manufacturers recognize the fact that in order to get economical results from the use of steam-power something more than the mere selection of good and efficient engines and boilers is necessary. They know that after the purchase of such machinery comes the necessity of securing such conditions as will allow of the best attainable efficiency in its use.

There are not many manufacturers who would invest in first-class and expensive machinery of that kind and then give it such conditions as would effectually prevent economical results being obtained; the intelligence and discrimination necessary to such selection being usually accompanied by the intelligence and discrimination necessary to perceive the importance of proper conditions for its economical employment.

The manufacturer who should provide for the furnace of his steam plant, fuel of a quality utterly unsuited to it, admit under its grates carbonic acid gas instead of air, supply the boilers with impure water to corrode and ruin them, or who should voluntarily allow his engine to run in a dust-laden atmosphere, with its journals supplied with stuff calculated to destroy them instead of lubricate them, would be considered very short-sighted and foolish, and there are few men managing shops who are not possessed of sufficient intelligence to avoid such a combination of conditions, or, in fact, any one of them.

But there are many shop-owners and managers who fully recognize this, and yet entirely fail to recognize a fact which should be equally plain—that is, that workmen, in order to attain the best possible efficiency, must be given the conditions necessary to secure that efficiency, and since that part of these conditions which relate to the health of the workman are imposed by nature, it is folly to disregard or attempt to evade them.

Mechanics and workmen are, in a certain sense, engines, whose energies are directed toward a certain end, for the accomplishment of which it is not only necessary that they should of themselves be fitted and competent for the work they are to do, but that they should be surrounded with all the conditions necessary to the best possible employment of their skill and energy.

It is not enough that they should be supplied with first-class tools and appliances, but also that there should be an abundance of fresh, pure air and light. Not only is light necessary in order that men may be enabled to see to do the work which they have to do, but it is necessary for health. Nature having designed mankind to live in the light of the sun, and to breathe pure air as supplied by her, it is important to proprietors, as well as to workmen, that use should be made of them as nature intends, and a failure to do so will inevitably result in more or less injury to health, and consequent decrease in efficiency.

The most efficient man, other things being equal, in either mental or physical labor, is the man who has the best health, whose lung power is greatest, and who secures for his lungs the proper amount of nature's lung fuel, oxygen.

We believe that the vast importance, from an economic as well as from a moral point of view, of securing for shopmen the proper sanitary conditions is very imperfectly recognized by many, if not a majority of shop-owners, and that a study of this question would result in decided benefits, both to employers and employees, in very many cases.—*American Mechanic*.

**INTERESTING EXPERIMENTS.**—Chief Engineer Ogden of the Philadelphia Water-Works recently instituted a series of experiments to determine the relative value of two different kinds of coal which he was using at those works. In raising 1,000,000 gallons of water 200 feet high, one ton of anthracite pea coal pumped 455,414 gallons, while one ton of bituminous coal raised 547,142 gallons to the same elevation. The bituminous coal raised 21 per cent more water than the anthracite. Cost of the anthracite, \$2.85; cost of bituminous, \$3.10. Another experiment consisted in pumping 1,000,000 gallons 114 feet high. One ton of anthracite pea coal pumped 872,636, while one ton of bituminous raised to the same height 887,420—in this case a difference of only two per cent. Cost of anthracite, \$2.95; cost of bituminous, \$3.14. The first experiment was made at the Belmont station, the second experiment at the Kensington station. The bituminous coal received at Belmont was from the George's creek collieries of the Maryland Union Coal Co. The bituminous coal used at Kensington was Columbia bituminous, such as is furnished to the city ice-hoists. The firing in each case was similar, and the evaporative qualities of the boilers the same. Worthington engines were used at both stations.

**A GIANTIC FORGING PRESS.**—The Atlas Steel and Iron Works, Sheffield, Eng., some time since constructed for its own use a gigantic hydraulic forging press, which is believed to be the most powerful and efficient tool at present in existence. It nominally exerts a total force of 4000 tons, but its actual full power is considerably greater. Three large furnaces, each capable of heating an ingot of 100 tons, prepare the work for the massive machine, and two traveling cranes, each capable of lifting 150 tons with ease, convey the forgings from the furnace to the press and manipulate them as required. One man, who stands at the floor-level in a cage suspended from the crane and traveling with it, has under his hand four valves, by which he lifts, lowers, advances, retires, moves sideways or revolves the forging on its own axis. A second man works the lever which governs the strokes of the press, and by observing an index in front of him regulates with the utmost nicety the distance from the anvil at which the top tool is to cease its advance. A forge-master and several furnace-men are also required to superintend and to feed the apparatus, but its working is entirely under the control of the two men referred to. Mr. Krupp of the great Prussian works at Essen made a special trip to the Atlas works to see the machine, and was so well pleased with its work that he immediately ordered one for his own works.

## Ammonia Engines.

An exceedingly interesting application of ammonia to motive-power purposes is at present being made by the Campbell Engine Company, 35 Wall street, New York, several plants now in operation showing highly economical results. One of these supplies power to the *Iron Age*, a 200-horse power Wright engine being worked by the ammonia gas during the day, when demands for power are made from various parts of the building, while during the night, with a lowered consumption, the requirements are met by a 40-horse power engine, built by the New York Safety Steam-Power Company, also supplied with ammonia instead of steam.

In general features the plant resembles an ordinary steam plant using a surface condenser. Its essential point of difference lies in the means employed to reduce the exhaust vapor of the engine to a liquid state. Expressed in a few words, this is accomplished by introducing into the exhaust vapor as it leaves the engine a jet of liquor taken from the boiler (after it has been cooled), and by cooling the vapor in a surface condenser which provides also for mixing such vapor as remains with the liquor already formed. The jet in the exhaust pipe is about one-eighth inch in diameter. The exhaust vapor after leaving the spray jet passes to a set of absorbers, which are practically surface condensers. In these the vapor is converted to a liquid state, and the resulting liquor overflows into a well, from which it is returned to the boiler by means of a feed pump. The absorbers are kept cool by means of a current of circulating water. The boilers, of which there are two, are of the regular horizontal return-tube type, and as one of them suffices for ordinary working, an excellent opportunity is offered for testing the relative economies of the steam and ammonia systems; one of the boilers being worked with water and the other with the ammonia. With the exception of a few simple attachments the plant presents no complications other than those found in a regular steam plant, and no special training of the attending engineer is needed to handle the machinery properly. The special fittings called for by the Campbell Engine Company's system can be applied to existing types of steam engines without much trouble, the only precaution necessary being the removal of brass where exposed to the ammonia gas. A series of tests which were conducted within the past year have yielded results of no little interest. They were carried out with a plant at 651 West Forty-sixth street, New York, the engine in this case being of the Porter-Allen type, rated at 60-horse power. The duty shown by this engine, according to the reports before us, was from 2.43 to 2.83 pounds of coal per horse-power per hour with ammonia, against 5.62 pounds of coal when running with water. Two other tests showed for the ammonia system a coal consumption per horse-power per hour of 2.52 and 2.61 pounds. The saving, as compared with steam, is more than one-half, and is accordingly entitled to serious consideration.

The odor of ammonia may be perceived to a slight extent about the plant, not sufficiently to be objectionable. The strength of the liquor is 17 degrees Beaume.—*Iron Age*.

**FIRE-PROOF MATERIAL.**—Fire-proof building material is coming in quite general use in the larger and finer class of buildings in our larger cities. Fire ruins show that porous terra-cotta bricks and blocks best resist fire, water and frost; next to these in the order of fire-resisting qualities come concrete and burned clay work. In the best work done, the iron work is incased in porous terra-cotta, tile or brick work in roof, floor, and tile construction. The hollow tiles are faced with vitreous tile, slate or any good weather-proof coating, or with a single thickness of brick. Iron and steel framework incased in fire-proof materials give the best possible results. There is a growing preference for light porous walls of hollow material protecting an iron or wooden framework. Massive and heavy walls of brick or stone will do for architecture, but they are not as much of a mechanical necessity as they were regarded a few years ago.

**INCREASE IN RAILROAD SPEED.**—It is stated that railway trains in England are now driven at an average speed which is 14 per cent higher than it was 20 years ago, with scarcely more than half the quantity of coal.

## SCIENTIFIC PROGRESS.

## With Your Head Northward.

Scientific Reasons for Sleeping at Right Angles to the Equator.

A doctor says: "There is no doubt in my mind but the belief that human beings should sleep with their bodies lying north and south has its foundation in true scientific facts. Each human system has two magnetic poles—one positive and one negative. Now, it is true that some persons have the positive pole in the head and the negative pole in the feet, and vice versa. In order that the person sleeping should be in perfect harmony with the magnetic phenomena of the earth, the head, if it possesses the positive pole, should lie to the south, or if the feet possess the positive pole the head should lie to the north. The positive pole should always lie opposite to the magnetic center of the continent, and thus maintain a magnetic equilibrium. The positive pole of a person draws one way, but the magnetic pole of the earth draws the other way and forces the blood toward the feet, affects the iron in the system, tones up the nerves and makes sleep refreshing and invigorating. But if the person sleeps the wrong way and fails to become magnetically *en rapport* with the earth, he will then probably be too magnetic, and he will have a fever resulting from the magnetic forces working too fast, or he will not be magnetic enough, and the great strain will cause a feeling of lassitude, sleep will not be refreshing, and in the morning he will have no more energy than there is in a cake of soap. Some persons may scoff at these ideas, but the greatest scientific men of the world have studied the subject. Only recently the French Academy of Science made experiments upon the body of a guillotined man, which go to prove that the human system is in itself an electric battery, one electrode being represented by the head, the other by the feet. The body was taken immediately after death and placed on a pivot, to move as it might. After some vacillation the head portion turned toward the north, the body then remaining stationary. One of the professors turned it half-way around, but it soon regained its original position, and the same result was repeatedly obtained, until organic movement finally ceased."

## The Present Status of Mineralogy.

In the study of any branch of science it is well to pause occasionally, that we may look about us, see where we are, what we are doing, and what we had better do. For that which distinguishes science from empirical knowledge is its unity of purpose, its coherence and its definite relation of part to part, and these features develop best when attention is temporarily withdrawn from the details of special research. As a science grows and increases in complexity, the individual worker must confine himself more and more to particular investigations; these, to him, assume undue importance, and their higher significance as part of a broad general field is ignored or lost. The petty details are essential, but, in co-ordinated, they make not science, but Chaos. The scattered bricks are good material, but they must be brought together into one symmetrical structure.

These remarks are particularly true of a concrete science like mineralogy. Here we have a branch of knowledge which rests upon the observation of material facts, and which hitherto has owed little to abstract reasoning. It has grown up partly as a "natural" science, partly as an outlying division of chemistry, and hypothesis has had little to do with its upbuilding. The mineralogist collects, observes, describes and classifies species as he finds them, determines their mode of occurrence, chemical composition and physical properties, and then too often considers his work finished, except as regards the gathering of more data of like kind, with possible refinements of method. The relations and bearing of mineralogy toward other sciences have been, with rare exceptions, slighted, and a general theory of its nature and purpose has hardly been considered at all.—*Popular Science Monthly*.

**EMISSION OF LIGHT BY SOLID INCANDESCENT BODIES.**—It is generally admitted, according to the researches of Draper, that when a solid body is heated it begins at about 525° C. to emit red rays, to which are successively added radiations more and more refrangible as the temperature increases. The investigations of M. Weber have led to different results. By observing, in an absolutely dark room, either an incandescent lamp, excited by a current of gradually increasing intensity, or plates of different metals, heated by a properly adjusted Bunsen burner, he found that the emission of light begins at a temperature much below that which we have mentioned, with the production of very pale gray rays, whose refrangibility is equal to that of the yellow and greenish-yellow rays of the central spectrum. As the temperature rises the light emitted grows yellow and gives in the spectroscopic a wide gray band, whose center is tinged with grayish yellow. At low red, a narrow red line appears at one side of this band, and almost at the same time a green band, large and of slight intensity, appears at the other side. The temperature still rising, the spectrum spreads both toward the

red and green ends, and M. Weber further ascertained, by means of a thermometric element soldered to the plates, that the first traces of gray light are emitted at a temperature varying with the nature of the plate, about 396° C. for platinum and 377° for iron.—*Revue Scientifique*.

## Amalgam and Its Uses.

Amalgam is a compound of two or more metals of which one is always mercury, and this circumstance distinguishes an amalgam from an alloy. Nature presents us with only one amalgam, which is silver, and is termed by mineralogists "native amalgam." It occurs in Hungary, Sweden, etc., and is met with either semi fluid, massive, or crystallized in rhombic dodecahedrons. Klaproth found it to consist of 64 parts of silver out of 100 parts. Most metals may be amalgamated with mercury, and the combination appears to depend on chemical affinity.

When the cohesion of metal is slight, as in the cases of potassium and sodium, or when its affinity for mercury is considerable, as in the instances of gold and silver, amalgamation takes place readily by mere contact. When on the other hand the cohesion of a metal is strong, or its affinity for mercury weak, heat or intermediate action or both are requisite to effect amalgamation.

If 44 parts of mercury be mixed with one part of potassium, combination occurs with the evolution of much heat, and when the resulting amalgam is cold, it is hard and has the appearance of silver. When the quantity of mercury exceeds one hundredth parts to one of potassium, the compound is liquid and an amalgamation containing only 15 per cent of potassium is susceptible of crystallization. The density of an amalgam exceeds that of the mean of the metals; this, and the tendency of one or both metals to oxidize, are additional indications of chemical combination.

There are some metals, it has been observed, requiring heat to amalgamate them. Antimony offers an example of this; to effect combination it must be melted, and while liquid mixed with hot mercury. Mere heat, however, causes scarcely any action between iron and mercury; they may be amalgamated by mixing the filings of the metal with powdered alum and rubbing them together with a little water. After trituration, the alum may be washed out. By the intervention of tin or zinc, iron may be combined with mercury and a double amalgam is formed. Patina also unites with mercury, by the intervention of the amalgam of potassium, but not by direct action. The double amalgam of iron and zinc does not rapidly undergo any change, and is not attracted by the magnet. All amalgams are decomposed by red heat, the mercury being distilled and the more fixed metal remaining. The process of amalgamation and decomposition is employed to separate gold and silver from their ores. The mercury obtained by decomposing the amalgams is distilled and repeatedly used for the same purpose with comparatively little loss.—*Chicago Journal of Commerce*.

**INTERNATIONAL GEOLOGICAL CONGRESS.**—The fourth session of this congress will be held in London from September 17th to 25th inclusive. Previous meetings were held in Paris in 1878, Bologna in 1881, and Berlin in 1885, at each of which a large number of geologists from all parts of the world were present. In Paris 21 countries were represented, in Bologna 17, and in Berlin 18. A circular has just been issued by the Organizing Committee of the London meeting, giving particulars of the congress, and stating the general arrangements. A large and influential committee has been formed, including the chancellors of the chief universities, the presidents of the more important scientific societies, and of those societies especially devoting themselves to geology, mining, etc., the Lord Mayor of London, and many of the chief Government scientific officials. The honorary president of the congress is Prof. Huxley; the president, Prof. Prestwich. Mr. T. W. Hulke and Mr. W. Topley are the general secretaries. To the last-named all communications respecting the congress should be addressed at 28 Jermyn street, London, S. W.

**THE FLIGHT OF BIRDS.**—"The Measurement of the Forces Brought into Play by the Flight of a Bird" was the title of a very interesting paper recently presented to the *Académie des Sciences* in Paris, by M. Marey. Anatomy shows that nearly all the muscles acting on the wing serve to lower it, while the data drawn from photo chronography show that during this lowering of the wing the mass of the bird is upheld against gravity and propelled forward against the resistance of the air, the result being flight. The author here studies these two elements of the motor power separately, whence may ultimately be deduced the sum total of the motor power.

**HOW MEN DIE.**—If we know all the methods of approach adopted by an enemy, we are the better enabled to ward off the danger and postpone the moment when surrender becomes inevitable. In many instances the inherent strength of the body suffices to enable it to oppose the tendency toward death. Many, however, have lost these forces to such an extent that there is little or no help. In other cases, a little aid to the weakened lungs will make all the difference between sudden death and many years of useful life.

## GOOD HEALTH.

## "Printing a Resistant Occupation."

A paper published in Lima, Peru, under the same heading, says:

When the yellow-fever epidemic in 1863 created consternation here, the Typographical Union had only to pay the expenses for two members, and both of them recovered. Now, to-day, the same incident is recorded in Chili with respect to cholera, where we find that, according to the report of the President of the Typographical Union of Valparaiso, up to the date of his last report, not one of the hundred members of the union had been attacked. Thus they enjoy the same good fortune they had experienced during the previous year.

The writer's experience in regard to the above does not verify the remarks of the Lima journal. It was his fortune to be acting as foreman in the *Placer Times* office at Sacramento during the cholera season of 1850-51. Out of nine men employed in the composing-room of that paper at that time, four succumbed to the dread disease. That city probably suffered a larger decimation from cholera than ever befell any other civilized city in the world. The estimated deaths were about one in five in the three or four months during which the cholera raged there at the time referred to.

## Health of the State.

The monthly report of the State Board of Health for April contains reports from 85 towns and cities, containing an estimated population of 709,550, in which occurred 1005 deaths—a percentage of 1.4 per 1000 during the month of April, or an average of 16.8 for the year, which, says the report, "will compare favorably with that of any State in the Union. Our greatest mortality is derived from visitors from the East, who, with diseased lungs, seek this coast in pursuit of health. Without this constant addition to our death rate our percentage of mortality would be wonderfully small."

Lung diseases—consumption, pneumonia and congestion of the lungs—were fatal in 144 cases.

The genial weather during the month is credited with having a marked influence in diminishing the spread of such diseases as the smallpox, measles, scarlet fever and whooping-cough.

**Diphtheria.**—An outbreak of diphtheria is noticed for the town of Rocklin, which, however, does not appear to have been very severe, as no deaths are reported, although 41 cases were reported as having been brought to the attention of the profession. The cause of this epidemic is accounted for by the report as follows: "The origin of the disease was traced to a family whose sanitary condition was of the worst possible description. From this family it was communicated to neighbors' children, who were playing close by. Another factor in the spread of the disease was an open sewer or ditch, that was used as a receptacle for a large portion of the filth of the town, and from which was constantly exhaled a most offensive odor. Owing to the comparatively dry winter, this drain was not washed out as usual by the winter's rain, and hence its putridity. If an example was needed of the close relation that filth bears to disease, it may be found in the history of this epidemic in Rocklin. Founded in filth, fostered in an insanitary home, the germs cultivated and diffused by the decomposition of animal and vegetable matter in an open ditch, polluting both air and soil, the result could be no other than it was, with its attendant deaths, that might have been prevented."

**Smallpox.**—Of this malady the report speaks as follows:

Although its area of extension has been much contracted by vaccination and revaccination, it still exists in some parts of the State. In San Francisco during the month 22 cases were reported, three of them being directly imported from China. Two cases were reported in San Benito, two in Siskiyou. Cases were reported in San Andreas, two of them in the county jail. The disease was also in Sheep Ranch, West Point, with sporadic cases throughout Calaveras county, except in Murphys and Angel's Camp, which are free of it. In Oakland there were four cases during the month, all convalescent, without any further developments. In Stockton, Dr. Rugglee writes the disease is "stamped out" since March 24th. In Homestead, outside the city, there have been ten cases during the month, all convalescing.

**Cancer.**—Twenty-five deaths are credited to this dread malady, 15 of which are located in this city. It is a matter of much regret that the antiquated and iron-clad code of ethics to which the medical faculty of the allopathic school cling with so little reason and yet with such strong pertinacity, should so operate on the minds of our health conservators as to forbid all inquiry into a course of treatment for cancer employed by a member of a sister association in this city. That treatment has often been referred to in these columns, and a large amount of proof presented which to the minds of many of the most intelligent of our non-medical citizens is considered incontrovertible, and yet the Medical Association of this city and county refuse even to consider it. Numerous

patients who have been under treatment—many by the knife and all by our most experienced physicians and surgeons without avail—have subsequently submitted themselves to the treatment referred to and been perfectly cured by constitutional treatment without the use of either knife or caustics. Many such, after recovery, have gone to the physicians to whom they have paid their money, and asked them in the name of humanity to satisfy themselves of such cases, which they had previously pronounced incurable—but in all cases have met with rude rebuffs—for such action is demanded by the "medical code of ethics"! Instances of this kind may be found in this city of eight or ten years' standing and no symptom of a return of the malady.

Many cases have come to our knowledge where sufferers, after having made up their minds to submit to the new treatment, have been drawn away by the specious arguments of their medical friends—and in every case that has come to our notice, to a fatal result.

It has been suggested that since the Medical Association have refused to inquire into the truth of the alleged cures, the city and county or State authorities should appoint a Medical Board of Inquiry into this matter. There would be no difficulty in securing an efficient Board to act under such authority, although physicians of standing would hesitate to act in their individual or self-associated capacity. We trust this growing feeling will soon take practical shape, to the end that either science and humanity may be advanced thereby, or the claim for success in the treatment referred to be shown to be groundless.

**DISEASES OF WINE-TASTERS.**—A German medical paper says: The diseases of wine-tasters were studied by Donnet of Bordeaux and Dr. C. Marandon of Dijon. Wine-tasters are frequently suffering with disturbances similar to alcoholism, although the claret-tasters do not swallow the wine, but on the contrary reject it and even rinse their mouths afterward. In one case of Dr. Donnet's a man 32 years old used to taste every day 30 or 40 samples of wine, occasionally liquors and rum, without ever allowing any part of them. After two years he became very excitable, lost his appetite, did not sleep well, and suffered with disturbances of sensibility, pains in the breast, a feeling of weakness, difficulty in breathing. He improved after abandoning his profession, although a nervous debility still remained, as noticeable by the facility with which he was set in tears. Another statement made by Dr. Donnet is the great number of apoplexies in Bordeaux, where many persons drink  $\frac{1}{2}$  liters of wine with each meal. This number exceeds the number of apoplexies in any city of the world. Dr. Marandon did not notice any symptoms of intoxication in Burgundy tasters, although some of them would swallow the sample. He remarks that tea-tasters always swallow some tea, and this fact, he says, explains the nervous symptoms they are affected with.

**THE PRESENCE OF SEWER-GAS** in a room may be readily detected in the following manner: Unglazed paper is saturated with a solution of acetate of lead in rain-water—one ounce of lead-salt being dissolved in eight ounces of the liquid. Allow the paper to partially dry and then expose it in the room which is suspected of containing the deleterious gas. The presence of any considerable quantity of the gas will turn the paper black.

## USEFUL INFORMATION.

## Bee Stings.

## Some Interesting Points About the Busy Creature.

It is a common mistake to suppose that an angry bee is certain to sting on alighting upon a human hand. On the contrary, she will always examine the skin very carefully first with the palpi—very delicate and nervous feeling organs, which are situated near the sting. It may seem that she stings at once, and without care or reflection; but a bee can do a great deal in a very short space of time, in proof of which it may be mentioned that "she can flap her wings more than 400 times per second, and that each flap involves the extension and contraction, through a nerve impulse, of the muscles employed in the wing movements." This being the case, as Mr. Cheshire says, "we shall see at once that the 'no time' difficulty is removed." When a person has been stung by a bee, he should remove the sting immediately, "if possible, by the nail, running it in the direction opposite to that by which it has entered." On no account let him take hold of the sting with his thumb and finger, or a forceps, for then he will probably squeeze more of the virus into the wound from the poison-bag, which is generally left attached to the sting. Although the virus of a bee-sting is a strong acid, it does not always follow that an alkali will cure it. Much depends upon the temperament and constitution of the patient, and, while *Arnica montana* and *Ladum palustre* will give relief in many cases, in others they are injurious. We may dismiss the subject of bee stings by giving the young beekeeper two pieces of comfort—the first, that at evening-time bees are nearly always in an exceedingly good temper; the second, that each time he is stung he will probably become less susceptible to the effects of bee poison.—*Saturday Review*.

**PROGRESS OF THE UNITED STATES.**—Probably no one thing will give a better idea of the progress of this country than the following facts in regard to our postal service: The immensity of the United States postal service is not easily comprehended. The sum to be appropriated for its maintenance during the year ending June 30, 1889, exceeds \$60,000,000, and of this formidable aggregate all but \$2,500,000 is derived by the department from its own revenues. The extraordinary growth of the country during the last 50 years is indicated by the fact that in 1839 the postal revenues were less than \$8,000,000. The present expenditure for railway transportation of the mails is \$19,000,000, their weight being the basis of compensation. On seven of the great trunk lines there is now carried an average daily weight of 578,934 pounds of mail matter, or 289 tons. The deficiency in receipts as compared with expenditures during 1889, according to the estimates, will not be half of what it was in 1876, when the latter postage was 50 per cent higher.

**EDUCATION AND POPULATION IN JAPAN.**—The people of Japan are greatly interested in the education and elevation of women. In 1887 there were 128 new schools and societies for girls and women established in that country. These are in addition to the public schools, which have long existed. Considering the density of population in Japan, the small number of populous towns is very striking. Only five have a population exceeding 100,000, namely: Tokio, 900,900; Osaka, 313,890; Kioto, 255,400; Nagoya, 126,930; and Kengawa, 104,320. Six only have a population between 50,000 and 100,000. This peculiarity in distribution is due to the circumstance that Japan is not an industrial, but an agricultural country. At the date of the last census there were 8898 Japanese abroad, of whom 4356 were in Corea, 2068 in China and 817 in America.

**A MAMMOTH ENGLISH GRAPEVINE.**—The largest specimen of a growing vine in Great Britain is a Black Hamburg vine in Kennell, in Perthshire, Scotland. This vine, planted about 56 years ago, has a main stem 22 inches in circumference and completely fills a glass house 270 feet long, and is still growing as rapidly as ever. Its yield last year was 2548 bunches, of which only about 500, averaging about two pounds each, were allowed to mature. A substantial subsoil of leaf mold was used when the vine was planted, but the only extra material which the vine now receives is broken bones in half-inch pieces. This vine exceeds in size the famous Black Hamburg at Hampton Court, the principal branches of which are about 110 feet long, though its trunk is 38 inches in circumference.

**WEALTH IN SCHOOLHOUSES.**—There are to-day in the five States of Ohio, Indiana, Illinois, Michigan and Wisconsin more than 50,000 schoolhouses, in which schools are maintained from three to ten months every year. The value of these buildings, with the grounds, is considerably over \$80,000,000, which is more than one-half that of all other public-school property in the Union. Nearly 3,000,000 children annually receive instruction in the public schools, while more than \$5,000 teachers, a large number of whom have been trained especially for their work, are employed as instructors. The total amount expended each year for the support of these schools somewhat exceeds \$32,000,000, or more than \$8 for each child of school age within the States.

**LOW COST OF PIG IRON ABROAD.**—Those who doubt the statements made concerning the low cost at which pig iron is made at some points abroad may be shocked to learn that the Ilse de Huette and Paine Walzwerke of Germany, according to their annual report, produced pig iron at \$5.57 per ton. The works made 114,000 gross tons of pig and converted 105,000 tons into steel. The dividend was 20 per cent, against 10 per cent during the previous year. It is easy to calculate from the above the quantity of iron which could be made in this country if it was admitted duty free from abroad.

**POWER FROM ARTESIAN WELLS.**—Heavy machinery is now run by artesian well-power in many parts of France, and the experience of the French shows that the deeper the well the greater the pressure and the higher the temperature. The famous Greenelle well, sunk to the depth of 1800 feet, and flowing daily some 500,000 gallons, has a pressure of 60 pounds to the square inch, the water being also so hot that it is used for heating the hospitals in the vicinity.

**A HEAT-RETAINING SOLUTION.**—In answer to the query, "What substance can be dissolved in water so that it will retain its heat longer when need to fill foot-warmers?" *Science News* answers: "A saturated solution of acetate of soda in hot water has been used for this purpose. It will retain its heat a long time, or until the acetate of soda has crystallized. It can be used over again indefinitely by reheating till the crystals are dissolved."

**FUMIGATION** is said to have originated with Aaron, a physician of Agrigento, who is said to have first caused great fire to be lighted and aromatic to be thrown into them to purify the air, and thence to have stopped the plague at Athens and other places in Greece about 573 B. C.

## Tulare Minerals.

The mineral resources of the mountains, which have been little prospected up to the present time, will some day furnish employment for a large population. Lime of the finest quality is abundant on the branches of the Kaweah, also an excellent grade of marble. Other stone suitable for building purposes is found in the neighborhood. Among the higher ridges of the range, about the headwaters of the river, a little prospecting has been done and the region is found to be a promising one. Gold, silver, copper, iron and lead are found, but the only place any mining has been done is at Mineral King, and there on a small scale only. The ore is rebellious, but some of it is very rich. It is claimed that zinc and tin have been discovered in the vicinity of Three Rivers, but no well-defined lead or deposit has yet been located. Plumbago exists in large quantities higher in the mountains, and the list of valuable minerals might be extended indefinitely.

It was in search of mineral specimens suitable for cabinets that three gentlemen, under the leadership of a scientist, sought the mountains. They were fortunate in having for a guide Mr. Orlando Barton, whose farm adjoins that of his father, Mr. James Barton. Soon after the party crossed the river from Mr. Bartwell's place they started out to climb the mountain, led by Mr. Barton as guide. He has resided many years in the Three Rivers country, is thoroughly acquainted with every ridge and canyon for miles around, has an excellent knowledge of minerals, and but for him the trip would have resulted in anything but success, owing to the fact that the evening of the second day would have to find the party again in Visalia. Another and longer tramp was taken the next morning, and it was discovered that prospectors have located numerous ledges of ore, but that little development work has been done on any. An overhauling of the "finde" before starting on the return trip showed that there had been gathered samples of copper ore—azurite and malachite—aragonite, limonite or bog iron ore, manganese, epidote, tourmaline in feldspar and quartz, crystallized lime, apatite, graphite, epidote crystals and garnets in quartz, also in copper ore. In places, garnets occurred in masses firmly cemented together. Other specimens were found, many of which were interesting, and to the collector valuable. A thorough investigation of that region would reveal much more of interest to the mineralogist. It may be mentioned that one who was a collector of Indian relics did not come home empty-handed, the Messrs. Barton having presented him with a number of stone implements which they had found in their own garden and orchard.—*Visalia Delta*.

**THE WATERMAN CASES.**—The Circuit Court has granted an appeal to the United States Supreme Court in the cases of Abbie L. Waterman against Governor Waterman and J. L. Porter. The cases were recently decided against defendants in the Circuit Court. In the former case \$70,000 bonds were required and in the latter \$12,000. Plaintiff claims that on May 14, 1881, Governor Waterman gave a contract to his brother, J. S. Waterman, to transfer to him or his heirs, on demand, any time within 12 months, an undivided 24 1/100 interest in the Alpha, Omega, Silver Glen and Front mines in San Bernardino county. At that time he owed his brother \$11,753.64 for money loaned. J. S. Waterman afterward advanced the Governor a loan of \$26,317, to be used in developing the mines. He was to be repaid out of the first earnings of the mine, besides receiving a 24-100 share in them. J. S. Waterman subsequently died, and his widow, Abbie, brought suit. It is claimed that the total amount which the Governor owes plaintiff is in the neighborhood of a quarter of a million.

**THE TRUCKEE RIVER.**—Where the Truckee river leaves Lake Tahoe it is 50 feet wide, has an average depth of five feet, and has a velocity of six feet a second. This would give a flow of 123,120,000 cubic feet, or 923,400,000 gallons, in 24 hours. This alone is an immense never-failing body of water, for about 100 streams, great and small, feed this lake, not to mention a great number of living springs, hot and cold, or many that rise from the bottom of the lake. After leaving Lake Tahoe, over 60 creeks of all sizes fall into the Truckee river before it reaches Reno. The more important of these tributaries are in California, and of these the following are those affording most water: Bear creek, Squaw creek, Silver creek, Hard Scrabble creek, Donner creek (which carries the surplus water of Donner lake), Cold stream, Prosser creek, Martie creek and the Little Truckee, which enters the main Truckee at Boca. These many large creeks add immensely to the volume of water with which the Truckee begins its course on leaving Lake Tahoe. At its head, at the lake, the Truckee is 6216 feet above the level of the sea; at its mouth, where it empties into Pyramid lake, it is still 4000 feet above sea level. The fall of the stream between Lake Tahoe and Pyramid lake is 2216 feet.—*Truckee Republican*.

NEVADA sheep are finding summer pasturage in Mono county, California, and the owners willingly pay the license tax of five cents a head.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**HOLLYWOOD MINING CO.**—*Ledger*, May 19: This company is applying to have its stock listed on the New York Stock Exchange. It was organized last year, with a capital stock of \$200,000, divided into 100,000 shares at \$2 each. It includes two mining claims, one called the Elephantine and the other named the Merrimac. They are located at Middle Bar, in this county. The former is a short distance from the mouth of the big tunnel, and the latter is in Hunt's gulch, about half a mile from the Mokelumne river. Both are undeveloped.

**MISCELLANEOUS.**—H. P. Holland has sent a carload of ore from the Matson mine to the reduction works at Melrose, Alameda county, for treatment. He is interested in the bond which was recently given of this property. He is sanguine of it proving a paying mine, under his peculiar method of working the ore. He is of the opinion that it ought to yield at least \$7 per ton, and this would leave a splendid margin of profit, as it can be mined and reduced for \$2 per ton. Should the test carload just shipped turn out favorably, it will not be long ere a mill of the new pattern is erected on the property. His method is claimed to be an immense improvement on the old stamp system. It dispenses with water as an agent in crushing, and also with quicksilver. It is said that a yield of 90 per cent of the assay value of any kind of gold-bearing ore can be guaranteed by this process. A contract has been let to run the tunnel 150 feet further at the Vulture claim in Hunt's gulch. This claim is owned by Jas. Landers and L. Newman. Martin White has taken the contract at \$3.25 per foot, and is now at work on the same. The tunnel is in 60 feet at present, and the new contract will carry it a total length of 210 feet. It is the intention to sink the shaft of the New London mine, near Plymouth, 200 feet deeper, before proceeding to the erection of a mill. The thorough method of prospecting this claim is without a parallel in the history of mining in this county. The shaft is now down over 1000 feet, with drifts run at various points. But the owners, who are wealthy men of San Francisco, do not shrink from any expense in developing the property, and have concluded to go 200 feet deeper, to see how the ore body holds out at that depth, with a view to a better understanding of what sized mill should be erected. The Plymouth Consolidated remains in statu quo. It is now reported that the shaft will be opened the first of next month. The Bunker Hill mine is reported to be looking better than at any previous period of its history. The mill is kept running to its fullest capacity, supplied from the tunnel on the Mayflower ground as well as the Bunker Hill mine.

## Butte.

**FORBESTOWN.**—*Cor. Oroville Register*, May 19: The Goldbank quartz mine owned by W. W. Stow & Co., of S. F., has a Huntington mill with a capacity of from 20 to 30 tons of ore per day, rock breakers, and two concentrators for saving the sulphurets which assay very rich. The machinery of the mill and hoisting works is run by five "hurdy-gurdy" water-wheels under a pressure of several hundred feet from the Forbestown ditch. About 20 men are kept steadily employed day and night in three shifts of eight hours each. Directly across the ravine and on what is really the same ledge is the Golden Queen, owned by C. J. Nickerson. He is in about 300 feet with a tunnel and is seeking to get perfect drainage before putting up his mill. The tunnel runs straight and is smoothly and solidly timbered. He has a large force of men employed and it is his intention to erect a mill this summer. It is rumored that the Shakespeare mine, owned by Belding, Vail & Nickerson, has been sold to S. F. parties and that extensive operations will shortly be commenced. The country surrounding Forbestown was in the early days one of the richest placer gold fields in the State. These, however, are now worked out, but the hills are ribbed ledges of gold-bearing quartz, and there is little doubt that at no distant day the caoyos will resound with the roar of many mills.

## Calaveras.

**HIGHER WAGES.**—*Mountain Echo*, May 16: If the standard rate of wages paid to miners in Amador county, and the majority of northern mining camps were adopted in Angels, the laboring man could live happily and meet the monthly accoutments of his creditors; the camp would thrive, and live and let live would be the watchword. Miners would feel encouraged and work with a vim and accomplish more in one day than a day and a half under the low rate now being paid. We hope the time will soon come when the laboring man will command a just consideration for his work in the mines of Angels. At the present prices asked by our merchants for the real necessities of life, it is impossible for a man of a family of from three to five, to keep the wolf from the door at the present low rate of wages.

**THE CONFIDENCE MINE.**—The Confidence mine in this town, is kept running in full blast day and night, and the shaft is being sunk as rapidly as circumstances will permit. The ore in the bottom of the shaft prospects well. The owners are sanguine that they have a valuable property in their possession, and such is the opinion of all familiar with the past history of the Confidence. We understand that it is the intention of the owners to erect a 20-stamp mill as soon as the mine is got in readiness for stopping.

**HIDDEN TREASURE.**—*Calaveras Chronicle*, May 19: The work of development at the Hidden Treasure, owned by Messrs. Hoolbrook & Blair, and situated near the Mokelumne river on the Amador side, is progressing favorably. A ditch, 1½ miles in length, for the purpose of conveying water to the mine has just been completed, and everything about the mine is being put in first-class working order.

**SINKING.**—Wm. Sales, E. q., of this place, has a force of men at work sinking a shaft on the Quaker City extension, recently purchased by him. As depth is attained, everything indicates a favorable development.

## Fresno

**NEW COAL FIELDS.**—*Fresno Expositor*, May 16: A. C. Welch and W. H. Morgan have returned from the mountains west of Huron, and report that they

have found three different coal measures in that country. The first was in Walton canyon, where the lead is a very promising one. After locating a claim the party went up Sulphur canyon and succeeded in finding another which promises to develop into a vein of four or five feet in thickness. Having located a claim at that point they then moved on some 15 miles to the Arroyo del Pulvero, where they found still another lead and located another claim. This also promises to be a very rich vein of coal. They brought back specimens of coal taken from these different places that indicate that valuable coal measures have been struck. It is all south of the Robinson & Rawlins mine west of Huron, and indicates that the Fresno coal measures are not only extensive, but very valuable.

## Nevada.

**AMONG THE MINES.**—*Nevada Herald*, May 11: A. S. and A. R. Lord have about 75 tons of ore on the dump at the Spanish mine, which they have taken out while sinking the incline deeper. The owners intend to put up a mill this season. The shaft on the Champion mine is down 35 feet below the 200-foot level, and the rock at that point is looking first rate. Drifts are being run in both directions from the shaft on this level. Messrs. Ellison and Tremaine are running a tunnel to open up a drift mine for Thomas and Harris, out on the Blue Tent road. Messrs. Webber and Murphy are working a drift mine about 1¼ miles west of town. They have good gravel at present, and as the deposit is an extensive one, it is expected the claim will be a permanent one. They commenced drifting last July. They will complete a drain tunnel, when the mine can be worked to better advantage than now. Danion & Co., at the North Merrifield, have put up heavier machinery, and are now sinking for another level. The prospects continue first-class. Fallon and Snell are prospecting for gravel in the Looe Star diggings. They have completed a tunnel 300 feet in length, and have reached the channel, and the gravel is said to produce well. Martin, Waters & Co. are sinking on the May Flower ledge, below the No. 1 tunnel. The tunnel is in 600 feet, and the winze from that level is down 40 feet. The ledge shows 2 feet in width and yields good milling ore. Five men are at work here. They are also working their flat ledge at 2 different points. This ledge is known to have a pay shoot 800 feet in length, varying in width from 6 to 18 inches, the rock from which is pay. Four men are now employed, and are taking out about a ton of ore each per day. About 2000 feet distant, tributaries are also working on this ledge, and are doing well. They commenced on Monday to crush 80 tons which they have taken out. The company are running tunnels which will open up these ledges from 200 to 250 feet deeper than the present workings of the mine. Great confidence in the future of this property is expressed by the owners. Mr. Boniole is preparing to work his mine through Gray's upper tunnel, out on Piety Hill. The Dower claim, on Piety Hill, is not a bad thing to have. He has taken out crushing after crushing which has yielded from \$5 to \$6 a day. It was formerly known as the Wagoner mine, and was worked by Wagoner, then by Lovely & Co., and then by Sigourney & Johnson. The different parties took out considerable money. Like his predecessors, Mr. Dower has worked through shafts until recently. Now he has made arrangements to work through Gray's tunnel, these claims all being on the same ledge. He can now work out 250 feet of backs. He has just commenced to stoep, and as the ground is loose picking, the ore can be mined very cheaply. There is a pay shoot about 1000 feet in length. Mr. Dower is now working six men. Last Tuesday he finished crushing a lot of 60 tons of rock. All the rock between walls is worked and pays.

**THE DROMEDARY MINE.**—*Herald*, May 17: From one of the owners of the Dromedary mine at Grass Valley, we derive the following: The Dromedary mines are situated on Winchester Hill, near Wolf creek, Grass Valley. This mine was worked until 15 years ago, and was of marvelous richness. So rich was the rock that specimens almost as large as a man's fist, and in which quartz was the exception, were often taken out. Finally it came into the possession of Mr. Berriman, Sr., but no effort was made to work it until recently. There are properly two ledges, called the Dromedary mines, but under the new company they will be known as the Berriman Consolidated. The present depth of the working is 250 feet. The new company are now making extensive arrangements toward the improvement and working of the mine. They are negotiating for a part of the machinery at the Allison Ranch and New York Hill mines, and this machinery will be used in the construction of the mill and hoisting works about to be erected. They are about to introduce a new feature in this section—a quartz-mill and hoisting works run by electricity. The dynamo will be placed at the Merrifield mine near this city, and the circuit, which will pass the New Eureka mine, will be 7½ miles in extent. The motive-power for the dynamo will be obtained from the ditch extending from Deer creek to the Merrifield mine. The machinery to be used in the mine will be heavy, and will make much labor necessary. The company are now estimating the cost of various systems of electric power and will soon decide which system they will employ. It will take some time to complete all arrangements, but the owners hope to begin active operations in about six weeks. A force of 50 or 60 men will be employed, and the work of taking out pay rock will begin at the start. In conclusion we will state that the pay shoot of this mine was never lost, as has been reported. There is a strong ledge now showing in the bottom of the shaft. The directors of this new company are: Nicholas Berriman, N. C. Berriman, T. H. Berriman, B. F. Berriman and Elam Biggs.

**A GREAT MINE.**—*Grass Valley Tidings*, May 10: Monday, May 7th, regular monthly dividend No. 223 was declared by the Idaho Gold Mining Co. of Grass Valley. Amount of dividend per share \$35—aggregating \$46,300. To date, the Idaho has yielded \$11,000,000, one-half of which has been paid in dividends. Two hundred men, more or less, are employed by the company, and the wages paid these has been a great factor in Grass Valley's prosperity for years. The Eureka mine, now worked out, was located on the same vein and over \$5,000,000 was extracted. Of this amount \$3,000,000 went to the stockholders in dividends, and it is a matter of current knowledge that this unequalled vein extends into the Maryland Co.'s claim, adjoining the Idaho. Further: The rich ore extracted from the Idaho of late years has come from close up to, and even up

to the Maryland lines. We reiterate that the Maryland mine is to-day the best undeveloped mining property on the Pacific Coast if not in the world, and if Grass Valleyans permit the 40,000 shares in this mine offered for sale by the principal owner to be gobbled up by outsiders, Grass Valley will regret. Every cent of the money resulting from this sale is to be spent in opening up the mine. We sincerely believe that the development of the Maryland will prove as great a factor in Grass Valley's future prosperity as has been the Idaho in the past and as it now is. Hence our interest in the project.

**W. Y. O. D. MINE.**—*Grass Valley Union*, May 16: Moody afternoon the W. Y. O. D. mine started their new hoisting works. The machinery was placed in order under the supervision of Archie Nivens, Sr., and is all that can be desired for the amount of work that it is expected to do. We glory in the "spunk" of the young men who are operating the W. Y. O. D. Almost unaided, as far as financial circumstances were concerned, they started work on the property, built their machinery for hoisting and pumping, and now have their shaft down 226 feet. The crushings coming from the ledge have proven a source of profit to the owners of the mine, and just as their hopes were highest the hoisting works burned down, which event has delayed them in their efforts to develop the mine. The pump was put into the mine yesterday, and with their complete rig they hope to have the shaft clear from water in a short time. There are about 20 loads of ore in the bottom of the shaft, already broken from the ledge, and that will be taken to Larimer's mill to be crushed on Monday next.

**HAVE GOT THE CHANNEL.**—*Tidings*, May 18: At the meeting of the stockholders of the Planet gravel mine of Lowell Hill, held in this city a few days ago, Supt. William Keskeys was present with a portfolio of the fruits of a washing. Several quite healthy pieces of gold, including one weighing \$2, were exhibited. Mr. Keskeys and other old gravel miners declare the samples to be undoubtedly "channel" gold—they showing very plainly the worn, smooth, "washed" appearance of gold found in positive channels. It is quite likely that on driving the drift ahead a very rich streak will be uncovered.

**GRAVEL MINE CHANGES HANDS.**—The gravel claim situated at Howard Hill, comprising about 20 acres and known as the "Mother Neal," has passed into the possession of John L. Smith of this city, by purchase. Some years ago the mine was worked by the hydraulic process and for a time yielded very profitably, but a complication of difficulties in which the anti-debris agitation played a part, caused a suspension of operations. Of late, men have been drifting on the channel, and it is thought the pay streak is not far ahead. Drifting will no doubt be continued by Mr. Smith.

**GRAVEL MINE SOLD.**—*Grass Valley Union*, May 18: Yesterday John L. Smith purchased the Mother Neal gravel claim from Herman Kruse. The claim is located on Howard Hill, and consists of about 20 acres of land. Some 8 years ago considerable work was done on the property by hydraulic process, and for two winters the claim yielded handsomely. The drainage was not sufficient and the outlet channel soon filled up, then further work had to be abandoned. Of late miners have been drifting on the claim, and there is every indication of 5000 striking a rich drift gravel mine.

**GRAVEL.**—*North San Juan Times*, May 19: D. R. McKillican & Co. have for some time past been prospecting a gravel deposit at Snow Point. They struck a pay streak, but the yield has not been large enough to satisfy them. A cleanup was ordered for the early part of this week, when, if the result is not satisfactory, operations will be discontinued by the present management.

## San Diego.

**PACIFIC DISTRICT.**—*San Diego Union*, May 17: Milton Santee has returned from a visit to the Sunnyside mine, situated near Salton, in the Pacific mining district, in this county, bringing with him many magnificent specimens of gold quartz. The Sunnyside mine is the property of Mr. Santee and other San Diego parties, who have the greatest faith in the wealth of the mine. Steps are now under way to develop the mine.

## Santa Bernardino.

**SOUTH RIVERSIDE.**—*Los Angeles Herald*, May 16: Although a continuation of the citrus belt, South Riverside, with its unsurpassed site, has turned attention from citrus culture to the possibilities of great growth which lie in the development of the mineral resources which are opening up in the near and encroaching foothills of the Temescal mountains. The old Temescal tin mine will soon be fully developed, and a new mine has been discovered nearer the town. Of the value of these mines there is no doubt. The coal discoveries are of importance; so much so, that a New York syndicate has purchased one mine, which yields at a moderate depth remarkably fine coal. It is free from slate, with but few traces of sulphur, and burns to a fine ash. The vein is well opened out, and is from 25 to 30 inches in thickness. Other prospects have been found, and the miners are jubilant. A general exploitation of the foothills will be made, and a mining boom may be looked for in this land of promise where est but growing crops was the outlook. Prospectors declare that they have found gold and silver ore, but such statements may be taken *cum grano salis*. But they have found, besides coal and tin, an immense quarry of porphyry rock and an extensive mine of mineral paint or clay of the finest quality. Already the crushing machinery of the Porphyry Paving Co. is on the ground, and in a few weeks 75 men will be employed to the quarry. The mine of mineral paint will soon be worked.

## Shasta.

**CHROME.**—Mr. Jones, of the great Chrome mine, near Sim Southern, in this county, was in town Sunday. Some heavy shipments of the material have lately been made to the principal works for that kind of material in the United States, those at Baltimore. The product of the Shasta mine is pronounced the best ever received at the works. We understand that Mr. Johnson, who was one of the owners in the mine, has sold his interest to Clay W. Taylor and Sylvester Hull.

## Sierra.

**PIKE CITY.**—*Cor. Mountain Messenger*, May 16: Darn rumor has it that the Alaska mine will soon start up again under a new management. The Sunflower Co. are making steady headway with their

tunnel. Nels Hanson and J. McBride have struck good diggings in Grizzly canyon, below the bridge. Cunoingham & Culligan are taking considerable money out of their claim. The Red Ledge Co. are going to put up a mill, but, then, that is getting "cheesnutty."

**GOOD PROSPECTS.**—*Sierra Tribune*, May 18: Johnnie Williams and Johnnie Egbert were down from Gold Lake this week where they have been at work upon their quartz mine. They have a two-foot vein about 40 feet beneath the surface and excellent prospects are obtained therefrom. The snow was four feet deep at the claim when they left.

**NEW DISCOVERY.**—A new discovery was made in the Kentucky mine to-day. Your correspondent was shown some quartz taken out and the rock is literally filled with gold. It was found in the banging wall and is about two feet in thickness.

**SACRED MOUNT.**—Work is progressing finely on the new tunnel at the Sacred Mount mine. The ledge more than holds its own in size and shows sulphurets in abundance, besides considerable free gold.

## Siskiyou.

**BLACK BEAR.**—*Cor. Yreka Union*, May 19: Ball & Co. are taking rich ore from their Mountain Laurel mine. Scarcity of water is the great disadvantage under which miners will labor this season. Quite a number of prospectors are, at present, working throughout the mountains. Golden & Evelev have leased the Doe & Daggett quartz-mill and will crush about 50 tons of rich rock from their claim at the head of Eddy's gulch. From all indications this rock will pay handsomely. Night and day shifts are at work driving the Mystery tunnel, which will intersect the main ledge in about two weeks. The Black Bear Co. has struck the ledge in the middle tunnel and the prospects are favorable for an exceptionally prosperous season. Large quantities of ore will be allowed to remain in the mine until the narrow gauge road is completed.

## Trinity.

**DEADWOOD.**—*Trinity Journal*, May 12: Deadwood is one of the most prosperous camps in the State. Franck and McDonald Bros. are making considerable improvement in their mill. They are putting in 5 more stamps and 2 more concentrators, and are putting in a 60-horse-power Hazelton boiler in the place of the old boiler, and a 40-horse-power engine. The boiler is the only one of the kind in Northern California. It is claimed that it will save one-half in fuel and is in every way a superior boiler. The stamps weigh 900 pounds, and with the 10 stamps they will now have they will crush 15 tons of ore every 24 hours. The owners say nothing about the quality of the ore they are working, but there is every reason to believe that it is sufficiently rich to pay good monthly dividends. The expense of making the improvements above mentioned will reach nearly \$10,000, so everything that comes out of a mine is not profit. They expect to have the mill completed and in running order by the 20th of this month. The Brown Bear Co. is running on full time and everything appears to be in a prosperous condition. Supt. T. J. Houghton is a thorough quartz miner and what there is in the mine the owners will get the benefit of. Mr. C. H. Watt, one of the owners, is having constructed a comfortable dwelling which he will occupy as a summer residence. Gibson Bros. have put in a tramway to be used in taking ore from a lower tunnel to the dump at the mill. They are running their mill steadily on ore from the "Little Gem" with satisfactory results. The quartz in the Deadwood district shows permanency and the camp will probably be a bullion-producing one for years after the present generation has passed out of existence.

**THE HARDCRABBLE.**—*Trinity Journal*, May 16: Dr. C. W. Spratt, one of the owners of the above named mine, E. J. Fork, was down last week and tells us that the mine is showing well, and that development work is being done, it being desirable to determine the extent of the ledge before making any preparations for crushing. Knowles & Prigmore, who took a contract to run a 50-foot incline, were driven out by water before the work could be completed. They then commenced a tunnel and run 29 feet. A contract has now been let to R. Gruss to run a 140-foot tunnel, commencing where Knowles & Prigmore quit, which will give the tunnel a length of 159 feet, and will tap the ledge at a depth of 160 feet.

**HAY FORK QUARTZ.**—Mr. C. C. Shattuck of Hay Fork was in town last Saturday, and says that work is being pushed steadily on his quartz property in Hay Fork valley. He is now engaged in developing and opening the cyclone mine so as to get it into shape to be worked to advantage. Last winter he ran a tunnel crossing the vein and is now running two tunnels, one 250 feet higher than the other. The ledge in the upper tunnel is about four feet wide, with well-defined walls, the ore, however, is not high grade, but carries rich sulphurets; he has not struck the ledge in the lower tunnel yet, but will reach it shortly, and will then have plenty of stopping ground. During the past few months Mr. Shattuck has made no attempt to run the mill—a Huntington with a capacity of 8 tons every 24 hours—on full time, but crushes enough ore to pay running expenses, while he devotes the greater portion of his time and energies to getting the mine into shape.

## Tuolumne.

**VERY RICH.**—*Tuolumne Independent*, May 19: The Boonza boys struck it again very rich on Wednesday of last week, taking out \$4000, and on Thursday \$3000. On Monday they struck another bunch of \$6000. On Wednesday, from Tuesday night's work, they cleaned up over \$3000 more, and have been taking out large sums, more or less, every day this week. A rich vein of ore was struck in the shaft at the Platt & Gilson mine, Soulsbyville, last week. This mine has every appearance of being equally as good as the old Soulsby.

**MINING AND FARMING.**—The pay-roll of the Black Oak mine, for the month of April, amounted to over \$3600. What do the grunners, who decry our mining interests, think of this? This large amount is put in circulation by only one mine. How many ranches would it take to circulate this sum in one month? And how many farmers will it employ to raise supplies for these miners? These two interests go hand in hand, and it is only the ignorant, in either calling, who will decry the mutual interests of both farmers and miners. Mr. J. W. Wells, who has recently taken out large amounts of gold from the mine which he and several others have

leased, on Wolfing's Hill, is again getting good prospects, and hopes are entertained that another large deposit is near at hand.

**GRAVEL.**—*Independent*, May 16: We learn that the Kincaid gravel mine has commenced operations again. Repairs on the reservoir engaged the entire force of men of the mine last week. Messrs. McCann & Neal are making fine progress in their mine situated 1½ miles east of the Basin mine. The shaft is down 35 feet and the lead is 6 ft in width. It is thought by competent experts who have seen and examined the rock that it will pay \$25 per ton.

**MILL.**—Ten dies and shoes were shipped to the Quartz mountain mill Thursday. A large five-foot hoisting drum and anti-dint cog gearing were shipped this week to the Black Oak mine at Soulsbyville. This machinery will enable the company to sink to a depth of more than 1000 feet. The above machinery came from the Sonora foundry. The surveying for the new ditch designed to carry water from the Tuolumne Company's ditch, beyond Bald mountain to a place selected for a mill in the Dickson ranch, was completed this week. The Dickson ranch claim, situated about one mile east of Sonora, was sold one day last week by Mr. F. Dickson to Mr. R. B. Lane of Stockton, for \$2500. We are told that the lode varies in width from six inches to over two feet, and that some of the ore is of a very high grade.

## NEVADA.

### Washoe District.

**POTOSI.**—*Virginia Enterprise*, May 19: The east crosscut from south drift on the 550 level is in 53 feet; face is in quartz. The west crosscut from the south drift is in 52 feet; face in low-grade quartz. The south drift on the 550 level is in 523 feet, and the face is in low-grade quartz.

**CON. CALIFORNIA AND VIRGINIA.**—The 1435 level stopes are yielding and looking well. The old crosscut from the Con. Virginia shaft on this level is still in a mixture of ore and porphyry. On the 1500 level the upraise from the drift running north from the end of crosscut No. 1 is up 22 feet. It continues to show streaks of ore. Fine ore is being stoped cut near the south end of the mine on the 1650 level. Vein material giving low assays is encountered in the southwest drift from the main north drift from the C. & C. shaft. During the week the usual quantity of ore has been shipped to the mills on the Carson river, and the assays will average about the same as last week—about \$37 a ton.

**LADY WASHINGTON.**—Are raising in the 725 level and are now up a distance of 300 feet in clay adjoining the veins. Yesterday morning crosscutting was begun from this raise at a height of 110 and 210 feet above the 725 level. On the 500 level the west drift from the new station was extended 32 feet, and the south drift to connect with it from the top of the 600 level upraise, 25 feet. Are extracting about 100 tons a day of ore of good quality from between the 400 and 900-foot stations, and are shipping about 70 tons a day to the Rock Point mill. The battery assays are \$26.50 a ton. Bullion on hand amounting to \$18,000.

**GOULD AND CURRY.**—El Dorado tunnel 6. The southwest tunnel has been extended five feet; total length, 150 feet; formation, clay and quartz. Drain tunnel level. The southwest drift has been extended 36 feet; total length, 467 feet. This drift has connected with the northeast drift from the main west drift, making its total length 498 feet. During the week there has been extracted from the 250 and 300 levels and shipped to the Douglass mill, 189 tons and 400 pounds of ore, the average battery assays of which was \$28.40.

**ALTA.**—Are extracting ore from the 825 and 1150 levels. The mill is running steadily. It crushes 600 tons a month, which is as much as the four concentrators can handle. The Keystone shaft is down 150 feet and is raised to meet it (from the 725 level) is up 300 feet. In a day or two an engine capable of hoisting from a depth of 1500 feet will be set up at the top of the shaft, the hoisting having been done heretofore with a hand winlass.

**CROWN POINT.**—The face of the new crosscut from the point where connection was made between the 400 and 500 levels is still showing good ore. The east crosscut on the 600 level is in quartz containing many bunches of ore, some of which give very high assays. It is expected that a good body of ore will be found when a point is reached where the clay is concentrated.

**CHOLLAR.**—The southwest drift from the north-west drift on the 650 level is in 124 feet. The face is in low-grade quartz. The north drift on the 550 level is in 398 feet. The north drift, No. 2, on the 450 level is in 490 feet, and the face is in quartz showing spots of good ore. The north drift, No. 2, on the 650 level is in 92 feet.

**HALE AND NORCROSS.**—During the past week have hoisted 1521 tons of ore from the 600 and 700 levels, and have shipped to the Nevada and Mexican mills 1217 tons of ore averaging \$35 a ton. The stopes throughout the mine are looking well. Have bullion on hand and have previously shipped for this month \$18,000.

**BEST AND BELCHER.**—On the 425 level the west crosscut started from the main north drift near the south line has been advanced 39 feet. The formation is porphyry and quartz. El Dorado level: The northeast drift from the main west drift has been advanced 55 feet. Formation, quartz, clay and porphyry.

**CONFIDENCE.**—Good progress is making in the north drift on the 1000 level. It is now out 336 feet. About 200 tons a day are being shipped to the Brunswick mill, Carson river. The battery samples average over \$40 a ton.

**OPHIR.**—The east crosscut from the end of the southwest drift from upraise No. 2, 36 feet above the 1465 level, is out 200 feet in vein material giving low assays. The usual quantity and quality of ore is being extracted.

**YELLOW JACKET.**—Are shipping to the Santiago mill 100 tons of ore daily. A good deal of prospecting work is doing. Promising vein material is encountered at several points, with increasing assays.

**BELCHER.**—On the 1300 level the west drift from the top of the raise are still obtaining promising assays. Repairs to the 1300 drift, jointly with the Segregated Belcher, are making good headway.

**IOWA.**—For the past week ending May 18 the

south drift from the McBee tunnel has been advanced 22 feet; total, 87 feet. The face is in block porphyry, showing small seams of quartz and clay.

**OCCIDENTAL.**—Have completed the ditch and laying of the water pipe. Upper tunnel: Forty-five feet below this tunnel, in the boiler winze, have cut out a station and started a drift north.

**SCORPION.**—The south drift on the 300 level has been advanced 20 feet during the week, making its total distance 275 feet. There is no change since last report as regards the formation.

**SEGREGATED BELCHER.**—Good progress is making in the upraise and rapid headway has been made in the work of repairing the joint Belcher drift on the 1300 level.

**CHALLENGE.**—On the 1000 level the joint drift with Jacket is out 133 feet, and the face shows fair ore. The drift joint with Confidence, on the 1200, is out 291 feet.

**ALPHA AND EXCHEQUER.**—The west drift on the 122 is in a mixture of clay and porphyry, while the north drift continues in quartz and porphyry.

**UTAH.**—On the 372 level the south drift has been extended 55 feet; total, 105 feet. The formation is porphyry, clay and quartz, showing some value.

**BULLION.**—On the 640 level the two crosscuts, east and west, continues in quartz that shows low assays.

**BALTIMORE.**—The pumps are kept in constant operation and are fast raising the water from the shaft.

**SIERRA NEVADA.**—The main drift on the 520 level is out 1550 feet. The face is still in clay and porphyry.

**UNION CON.**—Crosscut No. 1, on the 1300 level, 100 feet north of the south line, is still in porphyry.

**MEXICAN.**—On the 1300 level the west crosscut is out 520 feet, with face in porphyry.

**ANDRES.**—Bunches of good ore are found in the north drift on the 240 level.

**WEST CON. CAL. AND VA.**—The steam hoisting plant is being erected at the shaft.

### Aurora District.

**STRIKE AT AURORA.**—*Esmeralda News*, May 19: A strike was made in the Durand mine, which is owned by an English syndicate, last Sunday that exceeds anything in extent and richness that has been made since the times a way back in the 60's, when Aurora was producing her millions and furnishing employment to thousands of miners. The new discovery was made by the day shift while following the ledge, which varied in width from 10 to 18 inches, down the shaft, or rather incline, and consists of a body of ore from 3½ to 5 feet wide that assays a way up in the thousands. Superintendent Ann is now on the ground, having arrived last Tuesday, and soon all arrangements necessary for the speedy extraction and reduction of the new find will doubtless be made. The operations of the company in Aurora have been very satisfactory, it having about \$20,000 in its treasury after paying all expenses.

### Santa Fe District.

**SILVER.**—*Esmeralda News*, May 19: John Faegan is going to work on the Lizzie mine, a silver proposition, within a few days. B. F. Smith has five men engaged in working on the Tip Top mine. In this mine there is a well defined silver ledge, which carries ore that will go all of \$90 per ton. Mr. Smith has a quantity of ore now on the dump and his men are busily engaged in taking out more. Joe Pasante, owner of the Comstock mine, is not allowing the grass to grow under his feet, but is using every means to bring his mine to the front. Ten tons of ore were shipped from the Comstock some little time ago, which netted the splendid sum of \$1500, that is \$150 per ton. Mr. Pasante expects big things from his mine, and present indications go to show that his expectations are not in vain.

### San Luis Obispo.

**A KAOLIN DEPOSIT.**—*Arroyo Grande Herald*, May 19: On the north side of the Le Point tract there is a deposit of light clay that is pronounced to be a very good quality of kaolin, the material from which porcelain is made. If this is true it will prove to be very valuable, the raw material being worth \$2 per barrel. The knowledge of minerals of this county is yet in its infancy and there is no knowing what value deposits may be discovered.

### Tuscarora District.

**DEL MONTE.**—*Times-Review*, May 18: The drift from the tunnel has been extended 34 feet on the vein, which continues as at last report, and is producing some good chloride ore.

**COMMONWEALTH.**—The 100-foot level south drift from the station has been extended 24 feet; the face of the drift is not looking so well, being somewhat mixed. The south drift, 150-foot level, has been extended 17 feet, still showing very high-grade ore. The drift on the east vein has been advanced 11 feet; total, 37 feet; the ore has improved and is good grade, about 14 inches wide, with every appearance of getting larger. The east crosscut from north drift has been advanced 20 feet, encountering seams of black clay with small seams of sulphurets mixed through it. Average of the ore extracted during the past week, \$256 per ton.

**NEVADA QUEEN.**—Upraise from north drift on the east vein has been extended up 20 feet, with very little change in the top. In putting in timbers along the level, the ore taken down is very rich, and shows a width of several feet.

**NORTH COMMONWEALTH.**—The work of tracing out the Found Treasure has been completed, showing the ledge plainly from inside the North Commonwealth lines all the way down and into the Found Treasure workings.

**NAVAJO QUEEN.**—East crosscut from north drift 200-foot level advanced 11 feet. A good deal of water is coming from the face, which shows many seams of quartz containing sulphurets.

**FOUND TREASURE.**—Work is being confined to the southwest vein, and to that portion of the northeast vein, the title of which is not in dispute.

**GRAND PRIZE.**—Ore hoisted and put in the mill during the week is of good grade.

**NAVAJO.**—The winze from the 250-foot level stopes shows some good ore.

**NORTH BELLE ISLE.**—The north gangway, 400-foot level, has been extended 13 feet; the vein shows very strong in the face and is increasing in width; the walls are firm and the ground looks very favor-

able for a good development of ore. The stopes have yielded their usual amount and grade of ore. **BELLE ISLE.**—The stopes look fair and have yielded as usual.

## ARIZONA.

**THE SILVER BELT.**—*Prescott Journal-Miner*, May 16: R. H. Burnister and H. C. Church came in last evening from a visit to the Silver Belt mine, which is being worked by Fred. Little and George Olsen, under a lease, and report a big strike made there recently. This mine has already produced \$300,000, and from the present outlook will add millions to its record. Owing to litigation, work ceased on it some time ago, since which the former workings have been in more or less, and a new shaft was started by the lessees, a short distance from the main shaft. The site selected for sinking this new shaft was in an old opening worked by the ancient residents of this country, probably the Aztecs, and ore immensely rich was discovered, being almost pure silver. A cave occurred in the opening, and the work was abandoned at that point, and another shaft commenced further south. This is down now only to a depth of about 10 feet, but is in an ore body from 10 to 15 inches wide which goes \$400 in silver and carries a good percentage of lead. They have about four tons of ore now out ready for shipment. The present owners of this property are W. C. Bashford and R. H. Burnister, who owns two-thirds of it, and Sroule & McCrum of San Francisco, who owns the other third. There are three shafts on the property, one of which is 265 feet deep; one 250 feet, and the other 150. Levels have been run at 250 feet and 150 feet, and, as stated, previously to being closed on account of litigation, upward of \$300,000 was shipped from the mine. The character and extent of the ore recently discovered goes to show what has already been claimed for the property, that it is one of the best in this section.

## BRITISH COLUMBIA.

**JAMIESON CREEK MINES.**—*Kamloops Sentinel*, May 16: E. A. MacKenzie & Co., of Jamieson Creek mines, some 20 miles north of Kamloops, have bonded their property to a California syndicate, who have agreed to expend between \$3000 and \$4000 on the property within 90 days. If the syndicate desire to purchase the property at the conclusion of the option they have agreed to pay to each of the three owners the sum of \$15,000. The ore looks well and the prospects are encouraging.

**MINERS FOR ROCK CREEK.**—Miners are passing en route to the Rock creek mines. It is hoped the Government will soon commence work on the new road from Pentiction to those mines, and so give miners all possible advantage to develop their claims. The Cherry Creek M. Co. lately struck better prospects than ever. J. Morrison & Co. are down over 50 feet in search of the old Cherry creek silver lead. So far everything is satisfactory. Chinamen continue working placer claims on Cherry creek, and their number is steadily increasing—a sign there must be dust in paying quantities still.

## COLORADO.

**ORE.**—*Elk Mountain Pilot*, May 17: Paul Roche and Ira Cline brought some nice-looking quartz carrying gray copper, galena and zinc blende from the Grand Republic, Thursday night, and there is quite a body of it with every prospect of making a paying mine of the property. Wright & Frohn have moved up to the Lost Horse and will put in the summer there. There are a large number of prospectors at the hot springs waiting for the snow to melt in the mountains so they can get about. Metzler & Nicols started their mill at Irwin on Saturday last to see that everything was all right. They will commence in a few days for the season run as they have about 800 tons of ore on hand at present.

## IDAHO.

**NEW STRIKE IN ROSEBUD.**—*Wardner News*, May 16: Captain Horton came in from Osborn yesterday and expresses himself well pleased with the outlook of all the mines in that vicinity. In company with Mr. Alger he is pushing work vigorously on the Nellie lode, on which they are now sinking, and he says the property improves in appearance every day as depth is gained. The captain reports a big strike made a few days ago on the Knickerbocker lode. This property is owned by George H. Knight, and is located about 2000 feet west of the West Point group on Rosebud gulch, and is an immediate extension of the mines belonging to Horton & Alger. Captain Horton was searching diligently yesterday for some sacks. He declares he could not purchase one in Wardner, and says the same state of affairs exists in every camp in Coeur d'Alene.

**QUARTZ MILL.**—*Coeur d'Alene Record*, May 18: F. W. Day has made arrangements for the immediate erection at Murray of a small quartz mill, with plates, amalgamator and concentrator complete and of the latest and most approved designs. It will be erected just above Lyman Wood's planing mill and will be operated by water-power from Mr. Wood's flume. Work is to be commenced to-day. Part of the machinery has already arrived here, part is at Osborn, and the remainder, the concentrator, is on the road from San Francisco. The Centrifugal amalgamator will be used, and judging from its success in other places, it will prove a valuable aid in saving the gold in the tailings. It will be set up to-day and Jesse Coulter will give it a thorough test by running through it ten tons of Golden Chest tailings.

## DAKOTA.

**REDUCTION WORKS.**—*Deadwood Pioneer*, May 17: By telephonic advices received from Rapid yesterday afternoon, we are informed that the present test underway at the school of mines is progressing most satisfactorily. Fires have been started in the furnaces and no further delay is likely to occur. The test, however, will not be completed for three or four days, and while its result may be anticipated, nothing regarding it will be positively known before Friday. Confidence in the success of the enterprise, and the speedy erection of its plant, obtains abroad as well as at home.

**VISIONS OF WEALTH.**—The Deadwood corre-

spondent of the St. Paul *Globe*, writing of Prof. Clark's arrival and the proposed erection of leaching works here, says: "Visions of wealth greater than that possessed by Croesus, or coveted by Midas, tit by the fascinated gaze of vivid imaginations. Nor are such visions altogether visionary. Such eminent authorities as Riott, Blake, Carpenter, White and Clark himself, each of their men of wide reputation, who have examined and reported upon the districts to be directly benefited, have unhesitatingly pronounced that the discovery of an economical method to treat their ores would make the Black Hills one of the greatest producers of precious metals known to the world. The ore is here in vast, virtually inexhaustible quantities. Mining it is cheap, the formation in which it occurs enabling it in many instances to be quarried like limestone, granite or marble. The districts can now furnish 800 to 1000 tons a day, which will average \$25 per ton. The enthusiasm of the people is hereby explained. From \$20,000 to \$25,000 per day added to circulating wealth of the country, and all of it produced by properties owned principally by home people, is a thing calculated to excite self-gratulation, mutual gratulation and universal good humor."

**MORE TIN FINDS.**—M. Everly, who resides at Harney, was down from the tin districts yesterday and reported that another mountain of ore of the richest character had been recently discovered in the Harney district. He stated that, unlike the tin ores most common in the Hills, the new discovery did not contain large crystals, but rather fine tin so plentifully imbedded in the rock that the latter looked as if it were peppered full.

## LOWER CALIFORNIA.

**WATER SCARC.**—*San Diego Union*, May 17: T. J. E. Scoones has returned from Ensenada and the gold-mining regions of Lower California. Mr. Scoones asserts that the mines are as good as those of South Africa. He has in his possession gold extracted from the Valledaies district; also gold-bearing quartz which will average from \$40 to \$50 to the ton, and quartz from the Pueblo Rosario and Saragossa mines which has not been assayed. The great difficulty, however, to contend with, Mr. Scoones says, is the want of water, which will require a great deal of capital, time and energy to overcome.

## MONTANA.

**WOLF CREEK DISTRICT.**—*Great Falls Tribune*, May 16: Among the many promising mining districts in the Belt mountain range there is one which, from information recently obtained, bids fair to eclipse the others. We refer to the Wolf Creek mining district, about 60 miles southeast of Great Falls, in Fergus county, at the head of Running Wolf creek. The district was organized some five or six years ago, the first locations being the Sir Walter Scott and Mystery lodes, on the west side of the creek. The extremely rich and beautiful samples of ore from the croppings, assaying from 500 to 2000 ounces per ton in silver, immediately attracted the attention of every one interested in mining in this section, among others Mr. Paris Gibson, who secured a large interest in the property. The two claims mentioned contain 6000 linear feet by 600 feet in width. Development work has been quietly going on for the past year. The vein has been opened at three different points by shafts, and from 30 to 60 feet in depth, along the trend or course of the lead, proving the same to be continuous for at least a distance of 400 feet, and disclosing a defined vein from one to three feet in width, all good ore, and a portion of it of a very high grade, consisting principally of the carbonate and chloride of silver. Work is now being vigorously prosecuted upon the mine. There are many other very promising locations in the district which will no doubt develop into valuable mines, among which may be mentioned the Ried, Oxide, the Running Wolf and others.

**ALDER GULCH PLACERS.**—*Madisonian*, May 16: The placer mining season is somewhat later this year, but there are several of the claim owners who have begun work on their grounds. Abe Thurgood has been working some weeks on his Harris gulch claims; Alex. McKay is rushing off the gravel on his Biven's gulch mines, and the lower placers of Alder gulch are now in full swing of work. Notwithstanding the lateness of the season of beginning, a good summer's work is expected. The light snowfall of the winter is amply compensated for by the storms of the last two or three weeks, and there exists no doubt that the water supply, this year, will be fully up to the average.

## OREGON.

**SILVER CREEK.**—*Cor. Bedrock Democrat*, May 14: After 18 months hard work and an expenditure of several thousand dollars, D. C. Probasco has at last accomplished his purpose in completing a 160-foot crosscut tunnel to the ledge on the Heclaean mine, through the hardest of granite, and has run 16 feet into the lode with the opposite wall yet some distance ahead, and is now drifting south on a four-foot vein of ore, several of which were encountered in crosscutting, varying in width from a few inches to several feet, with clay gouge between them. In fact, the whole ledge seems a huge mass of gold-bearing sulphureted quartz. Col. Knowles has been forcing development work on the Eureka and Excelsior mines during the winter, resulting in several hundred feet of tunnels and 2000 tons of rich gold-bearing sulphureted quartz on the dump, and the opening up of a prospect which promises to become one of the chief of gold mines. A first-class road is now being built so as to admit of transportation of machinery to the mines. La Bellevue mine, owned by the two Cabell Bros., has, during the winter, produced upward of 100 tons of ore, with the development work of but two men, and over 100 tons of this is first-class shipping ore valued at from \$50 to \$250 per ton. Recent rich strikes, on nearly every prospect throughout this region that has been worked during the winter, have so stimulated prospecting that some of the ledges are being worked on every claim for miles along their course with the most flattering results; and so encouraging are the reports that a number of leading mining men of the Pacific Coast have been attracted this way for the purpose of investigating, all of whom express themselves satisfied beyond the most sanguine expectations, and compare the mines with such properties as the Ontario and Granite mountain.

No. 220 MARKET STREET,

SAN FRANCISCO, CAL.

Engravings made from photographs, drawings and original designs, for newspaper, book, card and job printing. Engraved prints enlarged or reduced, cheaply and quickly. Also copies of manuscript, legal documents, wills, contracts, signatures, portraits, buildings, machinery and printed documents reproduced with accuracy. Photographs, stereoscopic views, etc., duplicated, enlarged or reduced. Slides for magic lanterns made from photographs, lithographs, and steel or wood engravings, etc. Satisfaction guaranteed. Agents wanted in all cities and in all towns. Address, for further information, DEWEY ENGRAVING Co., 220 Market St., San Francisco.

**THE  
DOUBLE "ECONOMIC" STAMP MILL.**

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

**AN AUTOMATIC ORE FEEDER**

Goes with each Mill. We also have a snitable

**Rock Breaker.**

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

**FRISBEE WET MILL.**

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

**IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,**

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

**FRISBEE-LUCOP MILL COMPANY,**

GIDEON FRISBEE, Manager,

461 Howard St., San Francisco

HOOKER &amp; LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

PARKE & LACY, General Agents, San Francisco, Cal.

Sectional View of Pulverizer.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

### POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

PNEUMATIC PULVERIZER COMPANY,

- 382,819.—CARBURETOR—Louis Marks, S. F.
- 382,822.—HAY-PRESS—F. McKinney, San Diego, Cal.
- 382,830.—CARTRIDGE-LOADER—John H. Read, S. F.
- 382,731.—DISK HARROW—L. A. Richards, Grayson, Cal.
- 382,736.—MACHINE FOR PULLING HAIR FROM FUR SKINS—E. Schroeder, S. F.
- 383,021.—BUTTON-HOLE OPENER—J. R. Stephens, Portland, Ogn.
- 382,783.—CAR COUPLING—U. L. Uhlenhart, Astoria, Ogn.
- 382,895.—ROCK DRILL—W. O'Keefe, Elliston, M. T.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**HAY-PRESS.**—Finch McKinney, San Diego. No. 382,822. Dated May 15, 1888. This is a "perpetual" hay-press, in which the hay is forced in successive charges into one end of a tube of proper form to shape the bale, the bales being removed from the opposite end as fast as they are completed. The patent covers several constructions and combinations of devices designed to simplify and improve this form of press.

**CARBURETOR.**—Louis Marks, S. F., assignor of two-thirds to G. Schlesinger and George Burkhardt. No. 382,819. Dated May 15, 1888. This improvement in hydro-carbon gas generators consists of a series of supposed shallow pans or chambers fitted within an interior containing tank, with means for supplying the chamber with the hydrocarbon liquid and a peculiar arrangement of perforated pipes and chambers through which the air is forced for the purpose of enriching it to form a gas.

**DISK HARROW.**—Lovell A. Richards, Grayson, Stanislaus Co. No. 382,731. Dated May 15, 1888. This is an improvement in that class of harrows or cultivators which are provided with gangs of oppositely inclined disks, the inner ends of the shafts of which have shutting humpers. The invention consists of an improved humpers to resist lateral thrusts, jointed swivel-pins or shafts upon which the inner ends of the disk-bearing shafts may turn, and a connecting rod and lever by which these inner ends may be adjusted so as to relieve the main bearing-hoxes of strain.

**TRACTION ENGINE.**—Frank Batter, Slide, Humboldt Co., Cal. No. 382,857. Dated May 15, 1888. This is an improved traction engine for hauling upon soft or yielding ground where wheels cannot be employed. It consists of endless belts composed of shoes arranged transversely and coupled together to form the belts, a framework upon which is mounted the engine, and rollers upon which the engine frame is supported, and in combination with this, of an intermediate endless chain of links which rest upon the outer shoes while the rollers travel upon these intermediate links. This is intended mainly for hauling logs and timbers.

**ROCK-DRILL.**—Wm. O'Keefe, Elliston, Montana. No. 382,895. Dated May 15, 1888. It consists of a drill supported in a cylindrical sleeve with mechanism by which it may be rotated, a carriage upon which this mechanism is supported, and guides upon which the carriage moves forward as the drill enters the rock; a series of spring handled hammers connected with a rotary wheel, so that their power may be applied to the end of the drill, and an elastic crank by which the wheel is turned. With this drill the hole is enlarged toward the bottom, which allows the fine powder to be placed where it will do the most good. All of the machinery of the drill is set behind it, so that it can easily be worked by one man in a hole or place which is too small to admit of

more than one person, and too small to be worked on any other way. It takes very little time to set this drill, and its work is claimed to be very rapid.

## HEATING APPARATUS FOR BOOTS AND SHOES.

Frank Batter, Slide, Humboldt Co., Cal. No. 382,681. Dated May 15, 1888. This is a device for inducing a degree of warmth to the feet. It consists of a heating attachment fixed within the heels of the boots or shoes and connecting wires or plates extending therefrom so as to conduct the heat which may be developed to other parts of the shoe. The heater may be of any suitable form. It may consist of a slowly-consuming material which will give out heat for some considerable length of time, this material being introduced in the cavity of the heel; or it may consist of a heated rod or har of metal, or the interior cavity may be heated by a match or lighted cigar at will. Only a small amount of heat can be generated by this device, but being conducted by wires around the foot, it will often suffice to render the feet comfortable and prevent many of the results arising from cold feet.

## CARTRIDGE-LOADING APPARATUS.—John H.

Read, S. F. No. 382,830. Dated May 15, 1888. This invention relates, broadly, to the class of packing machines, and especially to the machines used for packing dynamite, nitroglycerine powders or other pulverulent substances or material into cartridges or cases. The invention consists in an improved and novel connection between the source of power and the plunger or rammer of the machine, said connections consisting, essentially, of a sliding cylinder connected with the plunger or rammer and provided with a valve-controlled port for the entrance of the air, and relief ports controlled by adjustable pressure valves and a piston connected with the source of power and working within the cylinder, whereby said cylinder is reciprocated with gradually diminishing length of stroke, though with an equal and elastic pressure. The object of the invention is to provide for applying power to machines of this class in such a way as to obtain an elastic connection between the source of power and the plunger or rammer of the machine; to obtain strokes which, beginning at the same point, shall gradually diminish in length as the cartridge shells or cases are filled, and finally, to obtain strokes which shall produce equal pressure on the powder or other material being packed.

## Mining Share Market.

The stock market continues inactive, though active work, with good success, is going on at the Comstock mines. The Virginia Enterprise thinks that San Francisco has turned her back on the mining industry. It says: "As things are going down there it will be well for the people of Nevada to take pains to cultivate closer relations with St. Louis and other big cities of the East. Already these Eastern cities are getting a bold on the mining industries of the country, and are getting the lion's share of the dividends. Boston alone is even now close upon the heels of San Francisco, and in less than a year will pass her as a mining city and a promoter of mining industries."

"The total dividends of the four months of 1888, ending April 30, was \$6,519,828. Of this sum San Francisco received \$1,753,750; Boston received \$1,700,000; St. Louis, \$1,138,000; and New York, \$938,728. Thus it will be seen that Boston—so often twitted as being timid and penurious—is really ahead of New York City as a promoter of mining enterprises."

"In the month of April Boston received dividends amounting to \$650,000; San Francisco, \$288,750; St. Louis, \$224,500; New York, \$124,576; and various cities and places, \$289,000. That St. Louis received \$100,000 more than New York City, shows that she is the coming mining city for the people of the Pacific Coast States and Territories. St. Louis went into mining later than any of the other cities named, but already she is pulling up alongside them. She made lucky investments in the start, and while making money—not losing it—learned her lessons in mining. Her experts are among the shrewdest in the field, and after making sure they are right, they go ahead. Coin is always forthcoming for an enterprise taken in hand in that city."

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Chollar, May 21, \$9113; Confidence, 21, \$15,406; Eureka Con., 23, \$17,000; Germania, 15, \$2326; Hanauer, 16, \$1790; Germania, 18, \$3484; Hanauer, 18, \$4230; Germania, 19, \$1601; Hanauer, 19, \$2060; Savage, 18, \$4400; Con. California and Virginia, 19, \$60,401; Argus, 18, \$6023; Savage, 24, \$28,000; Hale and Norcross, 24, \$70,574.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

## Hydraulic Gravel Elevators.

The Hendy Machine Works of this city give us the following memorandum: We have at hand a letter from Hon. R. H. Campbell, dated Etna, Siskiyou county, May 20, 1888, regarding the further operation of the hydraulic gravel elevator, which we furnished for his use on the placer mining property of the Quartz Valley Mining & Stock Raising Company, as related in the issue of the MINING AND SCIENTIFIC PRESS of the 19th inst. In this letter Mr. Campbell writes as follows, viz:

"Had I known that you intended to make use of what I wrote concerning the elevator in my last letter, I could have said more."

"My faith in the hydraulic gravel elevator system of working such ground as mine has been greatly strengthened; in fact, all doubts that I may have entertained heretofore concerning their working have been dispelled, and what I have done with mine simply proves what can and will be done in the future at Quartz valley and its vicinity, for I have several hundred acres of rich ground that must eventually be worked by the elevator system, which will take more than a lifetime to exhaust, besides much more adjoining that must be mined by the same system."

"It is only a matter of a short time when there will be half a dozen or more kept constantly in operation near here. Nowhere on this coast do the same facilities and extent of ground exist to warrant the extensive use of hydraulic gravel elevators, as here."

J. A. JOHNSON, 307 Montgomery street) the Nevada Bank building) is the general agent of the Stiles quartz machinery, and offers easy terms for introduction.

## MINING MEN

And the Public Generally!

AN UNPARALLELED OPPORTUNITY  
FOR INVESTMENT.

S. P. DORSEY, representing over three-fourths of the capital stock of the Maryland Gold Quartz Mining Company, of Grass Valley, which is divided into 500,000 shares, par value, \$20 per share, desires to dispose of a sufficient number of shares to develop this property, the value of which has been thoroughly demonstrated by the continued prosperity of the mine, from its commencement in the Eureka through the Idaho to the Maryland line; the product record of said mines being about \$15,000,000. The wealth of this wonderful and world-renowned ledge is shown by the latest workings in the Idaho to be as finely developed close to the Maryland line as in the richest part of its past course.

Any one investing in this property, can be assured of a continued success equal to its predecessors, viz.: Yielding 25 per cent in dividends per year upon the price at which the stock is offered for sale—viz., \$2 per share. For further particulars inquire of

S. P. DORSEY,  
At the Express Office, Grass Valley, Nevada County, Cal.

## Valuable Mining Property FOR SALE OR LEASE.

The Winthrop Mine, situated at Copper City, Shasta County, together with the fine mill, furnaces, etc., will be sold at a bargain and on easy terms, or will be leased for a term of years to a responsible party. For full particulars, apply to the owners,

SPRUANCE, STANLEY & CO.,  
410 Front Street. San Francisco.

## MECHANICAL ENGINEER.

An accomplished Mechanical Engineer—English—is open for an engagement. Specialties: Compound Engines, Locomotives, Mill and Boiler Plants for great economy and plotting Indicator Diagrams. Has been Inspector of Boiler Insurance Co. Can take full charge as Executive Manager. Address  
"B," care C. G. Y., P. O. Box 2361,  
San Francisco, Cal.

The BUYERS' GUIDE is issued March and Sept., each year. It is an encyclopedia of useful information for all who purchase the luxuries or the necessities of life. We can clothe you and furnish you with all the necessary and unnecessary appliances to ride, walk, dance, sleep, eat, fish, hunt, work, go to church, or stay at home, and in various sizes, styles and quantities. Just figure out what is required to do all these things COMFORTABLY, and you can make a fair estimate of the value of the BUYERS' GUIDE, which will be sent upon receipt of 10 cents to pay postage,  
MONTGOMERY WARD & CO.  
111-114 Michigan Avenue, Chicago, Ill.

## THE RAND DRILL COMPANY, 23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

## Dewey & Co.'s Scientific Press Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

GREAT REDUCTION!

### BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

### PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot-Cut, Hurred and Slot Punched Screens. Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,  
 21 & 223 First St., San Francisco, Cal.  
 JOHN W. QUICK, Proprietor.

### THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most simple and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

### ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Trams, cars, etc. Address

The Pelton Water Wheel Co.,  
 127 FIRST ST., SAN FRANCISCO, CAL.

### QUARTZ SCREENS

A specialty. Round, slot or hurred slot holes. Genuine Russia Iron. Homogeneous Steel, Cast Steel or American planished iron

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

INVENTORS, TAKE NOTICE!

1 New 12-inch, 35 H. P. Engine.

VERY CHEAP. Apply

130 Sansome St., room 1.

BACK FILES of the MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.  
DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by this fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).  
N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.  
ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

# \$1,000 CHALLENGE ACCEPTED,

**PRICE, FIVE HUNDRED AND FIFTY DOLLARS  
(\$550.00).**

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## Rock-Separating Apparatus for Mining Sluices.

Lawrence A. Fenner of Virginia City, Montana, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an apparatus to separate the larger rock from the finer material in ground-slucio and hydraulic mining, where want of fall or other conditions make it necessary to keep the heavier material from going into a hed-rock flume. To owners of flat mining ground this invention is a very important one, as it will be found of the greatest utility. It will in this direction have a large field of usefulness.

Mr. Fenner, who was one of the pioneers of Alder Gulch, Montana, has had some 27 years' experience in working flat ground. The usefulness of a practical separator by which rock can be handled rapidly and economically is apparent to every miner who has worked ground where want of fall or other conditions made it necessary to keep the heavier material from going into a hed-rock flume. Where there is want of fall it is made possible to work with a flume having little grade, and where the condition of dump is such as to make it desirable to retain the larger rock, the scoop in this machine can be graded coarsely so as to keep back only such as will interfere with the dump.

In mines where it is necessary to impound tailings this machine may aid in the solution of a difficult problem. Where rapid work is required, two or more separators can be used on a line above the head of the flume. The scoop of the head separator would then have a coarse grating and the ones below would be graded so that the gravel will be given the required fineness before passing into the flume.

The lower half of the 15 miles of Alder gulch, Montana, has but little fall, and only the finest portion of the gravel can be allowed to pass off through the hedrock flumes, which are necessarily of very light grade. Mr. Fenner owns a portion of this flat ground, and has for some years experimented with and perfected appliances to remove the rock. This machine is the result, and a boy with this can do the work of half a dozen men with forks and wheel-harrows, and so effectually that a hedrock flume with a grade of 1 inch to 12 feet carries the tailings with ease that pass the machine. The accompanying engraving shows the apparatus patented by Mr. Fenner.

In the lower portion of the framework of the apparatus is formed a small sluice, one end of which connects with the ground sluice. A horizontal grizzly is placed over the other end of the sluice. A perforated or grated scoop is placed over this sluice and directly behind the

grizzly. This scoop has a frame mounted on a pivotal shaft, by which it may turn through an arc in a vertical plane, making a partial revolution for the purpose of dumping its load. A vertical grating or grizzly is located between the horizontal grizzly and the scoop. This grating is secured to a frame having a pivotal shaft, whereby it may be raised or lowered about the shaft as a center through an arc in a vertical plane.

One end of the motor shaft (run by water-wheel) carries a friction pulley which operates on another placed on a winding-drum, to which is secured a cable, passing over suitable pulleys and connected with the frame of the scoop.

A weight is suspended by cables passing over pulleys, and connects with the frame of the scoop, by which the scoop is turned to a vertical

ing its load. When the scoop comes back to its normal position, the vertical grating is again raised to its position, and the operation continues as before. The weight referred to is so suspended and connected with the scoop that when the scoop is in a normal position the weight acts against it, to assist the main power in dumping it; but when the scoop passes the center the weight acts to bring it back again.

Owners of flat mining ground will be interested by a description of Mr. Fenner's process of working, before the conditions of his ground would admit of a hedrock flume of even small grade. A description he wrote for us about a year since is here reprinted, as, in connection with the engraving, it gives a good idea of the method employed.

"Commencing at my lower line, where there

strong enough to resist the pressure of the overlying wet gravel, which was considerable while ground-slucioing. It was laid to the head of each pit before filling, and the water let into it by a shaft, or monument, which was built up as filling progressed, so as to keep the sand and gravel from entering the tail-race. After stripping in this manner, the machine was moved up on the filled ground, and the remainder of the gravel shoveled into cars and hoisted as before, when the process of filling by ground-slucioing the surface from another pit was repeated.

A 12-foot overshot water-wheel, driven by 80 miners' inches of water, gave the power to hoist the gravel from hedrock, and to carry the washed rock from the machine back on the worked ground; the same water which furnished

power for hoisting being turned on to the sluices between each carload to wash the gravel. Working by this method for several years, five men (one to tend machine and four to shovel) removed and washed 12,144 cubic yards of gravel each mining season, 185 days being the average season.

Reaching a point on my ground where a flume was practical, my rock-separator was brought into use. This machine is placed near the ground to be mined, and at the head of a 30-inch hedrock flume having a grade of one inch to 12 feet. A moveable flume which can be curved to accommodate the ground-slucio above, and given sufficient grade, carries the

heavy gravel to the machine, where the rock is separated and dumped automatically on either side of the main flume, forming a continuous pile as the works are moved up. My plan of working is to keep the ground-slucio V-shaped, with the point down toward the machine. While ground-slucioing is progressing on one side of the V, hedrock can be cleaned on the other. After ground-slucioing and cleaning hedrock on one side of the V, a low wall is built against the unworked ground, and the top from a diamond-shaped pit, extending from the central line of the gulch to one side, is stripped in the same manner as before described when the sluicing was done at the surface, the continuous pile of rock at the side of the main flume restraining the tailings but allowing the water to pass off comparatively clear. This leaves a little over half of the bank to be ground-slucioed and separated by machine.

There is, without doubt, throughout the Pacific States and Territories, a large amount of ground which might be profitably mined by the use of one of these machines.

It is stated that the Broker Hill mine, New South Wales, where W. H. Patton is manager, will soon build four new 20-stamp mills.

FENNER'S ROCK-SEPARATOR USED IN WORKING FLAT MINING GROUND.

position where, by reason of its center of gravity being on its grated side, it gravitates to and is held in its normal position. A car is run in on a track just back of the scoop and is to receive its load. There is a brake-lever for controlling the movement of the winding-drum.

The operation of the apparatus is as follows: The material is fed through any suitable short flume or sluice, properly graded and arranged, to and upon the horizontal grizzly, through which a portion of the finer material passes into the sluice below. The vertical grating is at this time elevated so that the passage is clear to the main separator or scoop, through which the remainder of the finer material passes into the sluice below, while all the large rocks are retained. As soon as this scoop has a sufficient load the lever is moved, so as to relieve the winding drum of its brake, thereby allowing the operation of the friction gearing and the rotation of the drum which winds up the cable. The scoop is thereby drawn over through a partial revolution so as to discharge its load upon the car.

Before this is done, however, the lever is raised from its rack, whereby the vertical grate is allowed to move down and stop the passage of the large rocks while the scoop is discharg-

ing its load. When the scoop comes back to its normal position, the vertical grating is again raised to its position, and the operation continues as before. The weight referred to is so suspended and connected with the scoop that when the scoop is in a normal position the weight acts against it, to assist the main power in dumping it; but when the scoop passes the center the weight acts to bring it back again. Owners of flat mining ground will be interested by a description of Mr. Fenner's process of working, before the conditions of his ground would admit of a hedrock flume of even small grade. A description he wrote for us about a year since is here reprinted, as, in connection with the engraving, it gives a good idea of the method employed.

After clearing a pit as described, it served for impounding the tailings, which were ground-slucioed nearly half-way to hedrock, from the top of a pit of equal area above. While filling the pit, the water from the ground sluice passed off below through a box tail-race, with only fall sufficient to carry clear water, and which also served as a drain. This box tail-race was made

## Pebble Beach, Pescadero, California.

A Sea Beach on the California Coast Remarkable for Silicious Gems and Mineralogical Curios.

[Written for the Press.]

Officers of the coast survey have characterized the famous Pebble beach of Pescadero as one unique of its kind and without a counterpart on the whole extent of our Atlantic and Pacific coast-lines.

Its distinguishing feature is the mass of highly polished, pure silicious gravel bordering the sea at this locality, in which the topaz, carnelian, onyx, chalcedony, turquoise, agate and Jasper pebbles are found, buffed and perfected by ages of wave action as if by a lapidary.

Wave action has also eliminated all soft and angular minerals from the mass, save occasional fragments of alabone shells and chalcedony, and only the hardest stones survive the surf's eternal attrition.

Many of the topazes and carnelians are of rare clearness and beauty, and may be matched by patient search in size, form and color for jewelry, or for display in mineral cabinets.

Some fine pebbles of milk-and-fire opalescence are found; and the surf-polished crystals of pure, pumice quartz gleam like dewdrops in the multi-colored gravel.

The carnelians are of all tints, from blood-red to the palest pink or purple; and in some rare specimens the color is singularly confined to the middle of the stone, while the exterior is perfectly limpid.

Here, too, are found agates of every color and combination, the choice of which make handsome bracelets, watch-charms and other personal trinkets when cut and set. The smaller gems, however, of clear tint, perfect form and suitable size need no touch of art or lapidary's wheel, but in their natural state, set in contrasted colors, are jewels at once unique and of special interest. Stones of this class are generally small.

But chief among the mineral curiosities of the beach are the so-called "water drops," which are most abundant on a piece of sea-margin north of the main deposit, known locally as "agate beach." These are chalcedony pebbles, more or less translucent, and usually about the size and form of a lemon-drop, having a globule of water imprisoned in a central cavity, and an air bubble which, when small, looks dark by transmitted light and moves within like a living insect.

They are highly prized and much sought after by mineral and curiosity collectors. Mrs. General Dimond of San Francisco is accorded the credit of being first to discover and direct attention to these curios of the beach.

To the non-scientific the stone-imprisoned water is a mystery not less puzzling than the milk in the cocoanut. If it had percolated from without it should be sea-water; on the contrary it is perfectly fresh.

The explanation is that the aqueous drop was enclosed by the silica during the process of crystallization.

These curios, though rare, are not unknown in other parts of the world; and they are occasionally met with in the vugs or cavities of quartz veins during mining operations.

It is evident, however, that only under exceptional conditions of temperature can they exist on the surface of the earth as at Pescadero, since either a temperature below 30° would freeze, or powerful sun rays would expand the water within and fracture the silicious hulks.

On other sea-beaches washed crystals of smoky and limpid quartz occur; such crystals are plentiful at Long Branch, but I found there no other varieties worthy of note, and though many of these are beautifully clear while wet, they lose their limpidity when dry, owing to forcible impact one with another in the strong surf, which, as microscopic inspection shows, covers their surfaces with minute fractures.

At Pescadero, however, the silicious gem materials occurred in extraordinary variety and profusion; the sea floor and beach contour favored accumulation and a gentler attrition, and we have therein the fine lapidary finish of these lustrous stones the ultimate product of patient Nature and the tireless sea toiling through untold lapses of time.

Pebble gatherers are enthusiastic in their pursuit, and return again and again to the charmed precincts of the beach for new varieties, more perfect specimens, or to complete "sets."

And surely no hobby could be more innocent, more full of restful enjoyment and physical good than the gathering of these pleasing and imperishable mementoes in the exhilarant sea air and climate of the Pacific Coast, and in so delightful a locality.

But beyond its distinguishing feature, the Pescadero beach is otherwise interesting and picturesque. The receding tide leaves wide stretches of kelp-covered reefs, where fine sea-mosses and the beautiful alabone univalves may be obtained by the more adventurous visitor. Here, also, are things of interest to geologist and naturalist in the lithology of the shore, the fantastic carving and surf sculpture of the rocks, the pebble-paved pools and basins in the uncovered sea floor, hollowed as if by art, fit haunts for the sea nymphs, or fabled Amphitrite, and natural aquaria rife with varied sea life, lined with mosaic of purple-spined sea-urchins, limpets, and many-tinted sea-anemones.

The hotanist, too, especially one unfamiliar

with the California flora, will find much of special interest in the wildflowers, grasses and shrubs of the immediate coast-line, if he times his visit rightly, say in the period between March 1st and the close of July.

There is for the angler fairly good trouting in the Pescadero river, which rises in the higher Coast Range and courses through the village to the sea.

But better fishing may be enjoyed in several fine trout streams a few miles southward; and in the grand redwood forests east of the village, hunters and summer parties can find unrivaled retreats and camping grounds.

## The Beach and the Pebble Seekers.

A mile in lineal extent north and south will embrace nearly all of the Pescadero beach deposit; and "Bebble beach" proper is but a part of this, a crescent-shaped sweep of sea margin sheltered between rocky promontories and backed by arenaceous bluffs.

Around this crescent, on the seaward slope of clean, surf-washed and sun-warmed gravel, lie the pebble gatherers in all postures of ease, singly and in groups, sorting with unflinching interest the bright-colored mass, and dropping their selections into wide-mouthed hotties, cigar-boxes, or muslin bags made for the purpose.

Here is one who, with the indiscriminate zeal of a neophyte, finds lovely things on every hand, and speedily fills her hottie, her handkerchief, and other improvised receptacles with clear and many-colored stones, gems all, to her untrained eye; but here is another assiduous seeker more advanced in pebble culture, whose critical taste discards all but the perfect in color and form, and whose little vial happily holds all the gleanings of patient hours.

A smoke rises on the beach and a call is heard. This is the welcome signal that lunch is ready; and what an impromptu and enjoyable affair it is truly! Here is gyping under most charming conditions!

A campfire has been built from seadrift, and a tablecloth covers a flat-topped log, upon which cups and plates are arranged; the coffee is hot, and the sandwiches, eggs, cheese, cold meats, cakes, pies, etc., with which the baskets were hountfully filled by our hostess before leaving the hotel, are ready for appetites made keen by the pulse-stirring drive to the beach, the bracing seashore and the stimulus of genial rivalry in a common quest.

Formality is banished, and all the hotel guests, though but chance met to-day, may partake and chat with refreshing unreserve together, after which the various finds are shown and compared; but briefly, as the fortunate are eager to renew the search, and the less lucky are inspired with new hops on seeing the "beauties" found.

## The Town, Routes, Scenery, Etc.

The village of Pescadero (formerly a Spanish fishing settlement, as the name implies) lies out of the beaten tracks of tourists and traffic in a picturesque little valley, through which flows the Pescadero river, a limpid, mountain-trout stream, the ideal "brook" of Tennyson's poetic fancy.

It is nearly midway on the coast between San Francisco and Santa Cruz, and the nearest railway stations are at San Mateo and Redwood, from which points, and also from Santa Cruz, daily stage connections are made.

The best route is from San Francisco by the Southern Pacific railway to San Mateo; thence by stage of a very picturesque section of the Coast Range, passing through Spanishtown (Halfmoon Bay) and the ranches that border the sea, an enjoyable and typical California stage-coach ride of 30 odd miles.

But the outward trip from Pescadero by coach to Santa Cruz is a scenic treat of yet more delightful and varied character, and the traveler is alternately whirled through the foamy beach-surf of the Pacific, under cliffs, and over steep mountain buttresses, through sequestered ranches, hamlets and forest solitudes to California's greatest seaside resort; and from there through the grand redwoods and rugged scenery of the Coast mountains by the serpentine Narrow Gauge railway to Oakland and San Francisco.

The famous beach is two miles from the village, and there are no houses or accommodations for sojourners nearer thereto than the Swanton House.

Parties with camping outfit pitch their tents on the bluffs near the shore; but the hotel guests and villagers, according to ability or inclination, either walk to and from the beach, or go down in staging parties, which are usually made up in the morning soon after breakfast.

Pescadero is not a rendezvous of fashionable folk, nor a watering place in the usual sense; but it is a place of special attraction to anglers, hunters, campers, tourists and a cultured class whose tastes lean not to crowds and display; a favorite resort of many San Franciscans who periodically fly from the city's rout and turmoil for a term of restful change, and a spot of memorable charm to all who find joy with Nature in forest and stream, on mountain and beach, and who love the luxury of "old clothes" and the freedom of an unconventional life.

Good accommodations at reasonable rates are furnished at the Swanton house, a comfortable, unpretentious hotel with a number of detached one-story cottages for families and others desiring to dwell together.

These are bordered in roses and climbing vines, and front a pretty garden whose flowers bloom almost perennially among a profusion of

shrubs, exotics and shade trees that never know the hight of winter frosts.

It was from this umbrageous haunt of birds that on the odoriferous morning air came to my waking ears the ecstatic song of the California linnet from whose mellifluous throat, after a prelude of "chic-chic," poured helter-skelter a marvelous maze of liquid syllables—a carol as sweet and joyous, surely, as ever hushed from bird heart to greet the rising sun. And between these impetuous rhapsodies, blending with the susurris of Woodhine and acacia leaves, came dreamily to the sense the far-away lullaby of sea-murmurs, borne up from the estuary where the surf toils with the out-flowing waters of Butano creek and the Pescadero.

Strangers on this Pacific Coast are often troubled with the Spanish nomenclature there prevalent. The correct pronunciation of some familiar California names can be learned by attention to this rhyme and measure of the following jingle:

A man named Mayo  
Came from Vallejo (-layho)  
To San Mateo  
One summer day.  
Inquiring "Where, O,  
Is Pescadero?  
And what's the fare, O,  
To San Jose?" (Hozay)

MILES J'ANSON.

Woodside, N. J., May 7, 1888.

## Petroleum as Fuel.

A Practical Test Made by the San Francisco Glass Works.

For the past week the San Francisco and Pacific Glass Works has been using crude petroleum for heating purposes, with a view to demonstrating its vastly superior qualities as fuel, from an economic standpoint. A reporter visited the factory, on the corner of Seventh and Townsend streets, and was shown the workings of the new system by Carlton Newman, president of the Glass Co. The oil is pumped from an 1800-gallon storage tank, 275 feet away from the furnace, through a 1½-inch pipe, and is delivered at the burner under a pressure of about 25 pounds. Here it is met by a steam jet with a pressure just sufficient to spray it into the retort chamber. There are now available two burners, but it is found that one will easily keep the 16-foot at a white heat. The spray is not thrown directly against the crucibles, but is first re-generated in a hot air blast, which consumes all volatile gases and particles that may be held in suspension, converting them into a colorless, odorless, permanent gas. Whatever surplusage of oil may be pumped up is conveyed by an overflow-pipe back to the storage tank. All the oil pipes and the tank itself are from two to three feet underground, and the tank is 50 feet from the nearest building. The economic advantages of the petroleum as fuel are many. In the first place, there is not the least trace of smoke or gas anywhere noticeable, even in the furnace, or at the top of the stack. This, consequently, enables a superior article of glass to be made, and renders the work entirely unobjectionable to the neighborhood. The oil, moreover, costs only about \$1.50 per barrel. Four barrels of the oil are equal in heating value to one ton of coal. As the furnace requires about eight tons of coal per day, there is a saving of about \$70 a day. The oil, which comes from the Ventura wells, is about 80° flash test, which, as this test practically proves, is more than sufficient. "And here comes in the injustice of the city ordinance," remarked Mr. Newman. "By it we must use 90 per cent oil, which would cost us so much more as to make the use of oil impracticable."

The company employs about 150 men and boys and has a weekly payroll of \$2000. Thus it is that such manufacturing industries practically benefit the people of this city, the working people, who most need it, and, as Mr. Newman said, "the manufacturers of this coast cannot compete against the Eastern companies who use natural gas, unless an unjust and unwise law is repealed, and unless they may use oil as fuel."—*Alta*.

A HEAVY CARGO.—The ship Commodore T. H. Allen has cleared for New York with the largest cargo ever dispatched there from this port. It includes 5606 gallons of brandy, 269,866 gallons wine, 283,492 pounds wool, 126,768 pounds tin, 3058 gallons vinegar, 19,447 gallons whale oil, 185,603 pounds horax, 20,600 pounds copper cement, 46,436 pounds boiler compound, and 1,406,870 pounds copper ore.

A GOOD RECORD.—Captain Poleman of the steamer Oregon has just completed his two hundred and fiftieth round trip to Portland, Oregon, from San Francisco. During the time he has had command of the Oregon not an accident has occurred. The total distance he traveled, reckoning 1350 miles to the round trip, is 337,500 miles, or a little over 13½ times the distance around the world.

THE following telegram has been received from Supt. Price of the North Belle Isle. Owing to the stoppages at the mill occasionally, the bad condition of the boiler and a shading off in the grade of ore, I would advise the suspension of dividends pending the expense to be incurred in the erection of the concentrating plant and the setting up of a new boiler in the mill.

## The Expression of Our Movements.

## The Tournure.

[Translated for the Press from the French by M. N. M.]

The tournure, says M. Eugene Mouton, is the ensemble of the form, proportions and movements of a person. We look upon it as an expressive action, because it is the movement, that is to say the manner of carrying one's self, which is the preponderant element. With the same forms and the same proportions there may be 10 different tournures, according to the way in which the movements of the body are controlled. That is very well seen at the theater, where the art of changing the tournure is not less essential for a comedian than the change of visages.

The tournure is still more characteristic than the attitude; the latter is composed of a series of movements that a man may execute, whatever the forms and proportions of his body, while the tournure consists at the same time of invariable forms and proportions and of free movements. It conforms, then, more strictly to individual physiognomy and by evidences so manifold and striking that, when the tournure of a person is merely seen from behind, we can imagine the features of the face. It is an experiment easy to make on the street, and, though it sometimes fails, it very often succeeds.

Whatever may be the connection between the countenance and the tournure, it is recognized at the first glance of the eye when we observe a figure in its ensemble. The same characteristics, the same signs, express in the tournure what they express in the face. In greatness, in littleness, in height and in breadth, in the rectitude or curvature of lines and surfaces, in the more or less of order and proportion of parts and masses, analogous effects correspond to those which the same modifications produce in the characteristics of the other.

A tall stature, a small and well poised head, shoulders distinctly shaped, narrow hips, and long limbs constitute an elegant tournure.

## But it is a Condition

That the bearing may be firm and flexible, and that the movements may be just and harmonious. If the head be stooped, the shoulders and arms drooped, the back curved, the legs bent, and the feet dragged along, you will have a tournure as ungraceful and as pitiable as possible.

It has been often remarked that it is much easier for a thin man than for a fat one to have the *air distingue*. That is true on account of the physical distinction which results from the proportion of the parts of the body. But if the nature of things interdicts to fat men that kind of distinction, their corpulence, the amplex of their stature, and of their characteristics give another more imposing sort of distinction called "*un grand air*."

It must be understood, however, that a tall stature is the condition almost indispensable to such an advantage. A short man, stout, stuffy, obese, cannot have an elegant tournure, because his limbs, obstructed by fat, are able to execute only slow, heavy and contracted movements. Pretense and modesty, energy and feehleness, all the shades of character, all professional signs, have in the tournure expressiveness precise enough, and in general, sufficiently recognized to be readily translated in ordinary language; so that "tournure" may be used indifferently for "figure" or "physiognomy," as when we say, for example: a tournure of a knave, of a foolish person, of a conqueror, etc., it is the same as saying, a modest, ridiculous, martial, awkward or gracious tournure. In short, as we see, the tournure is at the same time a natural and an acquired disposition; it brings then to the whole "physiognomy" a double distinction, and, furthermore, it pervades all parts of the figure, which still adds to its importance.

When we analyze attentively the elements of what we call the "air" of a person, it is but an equivalent of language in order to express sometimes the tournure, and at other times the attitude, because all that has been said of these last two expressive actions might be said of the "air." This word then becomes a part of the physiognomical vocabulary, and is oftener employed than "tournure" and "attitude." In it would be found, perhaps, more precisely that shade employed to qualify an action rather than to characterize a person.

## The Walk and the Gait.

The walk is progression by the displacement or change of the center of gravity. It is done in moving forward, backward and sideways; is slow or rapid, continuous or by jerks, straight or irregular, in its direction. The run has less of effort and by exceptional labor is performed only in going forward.

It is not the difference in rapidity that makes the distinction between the walk and the run. It is the difference of attitude; for a rapid walk may equal a slow run. In walking the body remains straight, and the center of gravity continues nearly perpendicular to the line traced upon the ground from one foot to the other. In running, on the contrary, the body inclines, the arms project forward, each of the legs is in turn thrown backward, the whole figure tends to place itself as near as possible to the horizontal, and that in proportion to the rapidity of the running. It follows that the center of gravity is, in running, diverted much more from the perpendicular. Under these conditions running may be considered as a continual fall, but

a fall in which, in holding up the body, the legs transform into horizontal movement, the vertical movement impressed on the body by heaviness. Heaviness then, produces a considerable difference in the speed of running, and therefore by instinct a person bends forward in running. This position helps, moreover, the walk also, which becomes easier and more rapid as we lean forward. But that which makes still better the distinction, is that in running there is between one step and that which follows, an instant in which the two feet are at the same time in the air, while in walking, one foot is raised only at the instant in which the other foot is placed.

#### The Walk, Above All

When it is a little rapid, is always accompanied by a balancing alternately of the two arms, the left arm advancing when the right leg moves forward and the right arm when the left leg does the same. This balancing has for object and for result to throw forward the weight of the arms and to aid in displacing the center of gravity. At the same time the loins execute alternative movements of torsion, or twisting to right and left, accompanying the movement of the leg forward. Finally, the swinging of the arms impels a swinging more or less marked of the shoulders. Such is the analysis of walking and running. Although these two species of movements may be ordinarily only a dynamic action, they constitute a function of relation, and by the varied manner with which they are accomplished, they become in many cases as expressive as the gesture and the attitude.

At each of their variations there are corresponding expressions, always governed by the general principles of physiognomy. That is so true that language not only qualifies diversely the walk, but we govern it in the sense of the expression desired. A dignified, graceful walk is a trait that every one remarks and that every one on occasion will not fail to affect, just as one will laugh at a walk which is ridiculous or ungraceful.

(To be Continued)

#### Inyo's Death Valley.

Death Valley is a noted section. It is noted over the world. Such a barren waste exists nowhere else on this continent. It has been known for many years that gold and silver mines exist along the borders of this wonderful desert, which are of astonishing wealth. Hundreds of hardy prospectors have braved the dangers of the plains, but never have been able to make any great progress on account of the difficulty experienced in transporting machinery into the country. It is expected that relief will be obtained at no distant day by the advent of the Carson narrow-gauge road which is now headed for San Bernardino, and which will cross this great desert. Peter T. Cochran, a resident of this city, has just returned from a perilous journey to and from the valuable mines which are located in Inyo county. Mr. Cochran says that about two months ago a party of six miners, headed by S. M. Sterling, of Colton, started for the Inyo country for the purpose of prospecting. This they did for about a month, when they were compelled to return on account of the provision supply running out. Even the Indians were out of food, and there was great rustling on their part for the actual necessities of sustenance. They made some very good discoveries and saw some mines which were paying tolerably well. The "diggings" in this section, at least many of them, were very old, are very good, though but few are working. In some portions there are immense gold and silver ledges, the surface cropping being wonderful. The country rock is porphyry and slate, and many fine specimens were brought back by the party. Mr. Sterling has gone East to obtain the necessary capital for further pushing his discoveries. It is his intention to put in a 10-stamp mill on the Inyo mine. This mine has a four-foot vein, which is growing wider as depth is attained. It can be traced for miles. The mountains around Inyo are full of mines, and the owners are waiting patiently for some means whereby they can obtain machinery and supplies at reasonable rates. At the above place there is no lack of water and the sides of the mountains are covered with the very best of timber for use in mines. As the properties are situated but about 200 miles from San Bernardino, they will, should the Carson road be built, be of great importance to this city, as they will, in a great measure, assist in the booming of our city. It is the intention of the party above referred to to visit the place again during the summer and further their interests.—*San Bernardino Index.*

**MINING AND METALS.**—Mr. Richard P. Rothwell, the editor of the *Engineering and Mining Journal*, has been invited by the Hon. Carl Schurz, president of the United States Almanac Publishing Company, to write the essay on mining and metals for that publication, which is to be a comprehensive presentation of American products, industries and commerce. From 20,000 to 30,000 copies will be distributed all over the world by the consular office of the United States under instructions of the Department of State.

The Boca Mill and Ice Co. are enlarging their dam so as to have the ice pond cover nearly one square mile. The improvements will cost \$40,000.

#### Forest Hill Drift Mines.

##### Back Channels.

We take from the letter of a correspondent of the *Placer Republican* the following statements:

During my first visit we were impressed with the fact that although the mines were yielding immensely, every individual miner was working for the great hope that was ahead of him, namely, the back channel. At that time the Jenny Lind, the Jersey and the Independent were running hedrock tunnels for the back channel. They had got back on hedrock, some of them, over 2000 feet, but were still in rock. You ask, "Where did the money come from, then?" That, they claimed, was a "lucky hit." They had raised up through the rock and, finding a very rich stratum of soft, red gravel, they were working this out by the drift process. How "lucky" this find was the record of that district shows. By referring to the records at the San Francisco mint, it is found that the Jenny Lind took out over a million dollars, the Jersey a million and a half and so on all down the list. Coming back here to-day, I find those tunnels still in hedrock, not a single mine on the front of the divide having gone back far enough to get to that lead.

The Jenny Lind Company got into trouble and sold out to the adjoining claim-owners. The New Jersey claim prosecuted its work on the hedrock until the rock pitched so that they found their tunnel too high to work the lead if they reached it. The Independent, finding its tunnel too high, went back to the canyon and sunk a shaft and actually found the back channel, and, after working it enough to prove its richness, were driven out by a flow of water they could not manage. So time went on, and the front ground being nearly worked out, but little development was made at the hill or on the divide until Mr. Chappellet began sinking a shaft on the May Flower mine. To the uninitiated it is a mystery how these miners know the back channel is there, but they do as the fact develops. Mr. Chappellet sank a number of shafts under difficulties and discouragements that would have overcome most men, and finally struck the channel. It is an open secret how he took out gold enough in a very short time to pay all his expenses—the expenses of several years of dead work through shafts, contending with water and bad air and other things too numerous to mention. However, he found the back lead, and to Mr. Chappellet is due the credit of proving the truth of the miners' conviction of its existence ever since they began to mine in the district. Mr. Chappellet, after locating the lead, has since run a tunnel of over a mile in length to the lead at great expense, and has now a mine worth—well, \$800,000 is the price that a French syndicate has paid for it, I am told. This development made by Mr. Chappellet in the May Flower has no doubt given a new impetus to the working of the mines in the district, but the miners at the Hill have all along been diving away in one place and another, the Dardanelles being worked as a hydraulic claim until the debris decision put a stop to that. It then became the property of General Jo Hamilton of your town. Many were the surmises and figures of speech indulged in by the old miners as to how "long-headed Jo would run a mine." They have just found out. He went to the divide and stayed there until he "formulated a theory" as to how that mine was to be worked, and our visit to the divide at this time was to visit the mine and find out for ourselves how and where he struck it.

Well, we found out that after spending considerable money on hedrock tunnels and raising up shafts and prospecting around generally, he placed Henry May (who was a principal owner in the Jenny Lind in early days) in full charge underground with orders to work where he pleased till he found it. Of course, being an old miner at the hill, he knew it was there. They all do, but Mr. May, in this case, proved his case. He worked for several months, going into the hill a distance of about 2200 feet, I am told, and then struck the blue lead; and a rich lead, as it proves to be. They have a breast of 75 feet wide in blue gravel that by a very crude way of working averages \$9 to the carload. Having developed it far enough to warrant its permanency, General Hamilton has erected a 10-stamp mill, only putting in five stamps at first, that will start up in a few days. We were taken into the mine and spent some time prospecting for ourselves, finding gold all over the face of the drift. The miners were not at work, as they have filled up all the bins and places to hold the gravel, and are now waiting for the mill to crush it. One of the men, well used to the sight of gold, told me that in the 390 loads in the bin was money enough to repay the whole expense of mill and improvements. To test this, we pounded up in a mortar a piece about eight pounds in weight, and got over \$5, in grain about the size of rice. The question is, has Hamilton struck the back channel? When first struck the lead or channel appeared to run across the divide. The back channel runs up and down the divide, but as the lead is further developed it is making up the divide, to the satisfaction of those who say it is an outlet of the back channel. Whatever it is, it is like the Mayflower lead in color and general characteristics, and has every appearance of being as rich and extensive. After the mill is working I will let you know the result as near as I can learn.

I have made no mention of the Paragon mine,

otherwise the Breese and Wheeler. To tell the truth, that mine speaks for itself, turning out more gold, I believe, than any other gravel mine in the State. The present working of the mill is upon a very rich lead of gravel. No one questions whether it be on the back channel or not, for it is a belief among miners at the hill that the Paragon can not miss it. It always pays enormously. The claim, it is said, has never had to be prospected for pay. They get it all the time.

#### American Locomotives.

The key to the evolution of the American railway is the contempt for authority displayed by our engineers, and the untrammelled way in which they invented and applied whatever they thought would answer the best purpose, regardless of precedent. When we began to build our railways, in 1831, we followed English patterns for a short time. Our engineers soon saw that unless vital changes were made our money would not hold out, and our railway system would be very short. Necessity truly became the mother of invention.

The first and most far-reaching invention was that of the swivelling truck, which, placed under the front end of an engine, enables it to run around curves of almost any radius. This enabled us to build much less expensive lines than those of England, for we could now curve around and avoid hills and other obstacles at will.

The next improvement was the invention of the equalizing beams or levers, by which the weight of the engine is always borne by three out of four or more driving-wheels. They act like a three-legged stool, which can always be set level on any irregular spot. The original imported English locomotives could not be kept on the rail of rough tracks. The same experience obtained in Canada when the Grand Trunk railway was opened, in 1854-55. The locomotives of English pattern constantly ran off the track; those of American pattern hardly ever did so. Finally all their locomotives were changed by having swivelling trucks put under their forward ends, and no more trouble occurred. The equalizing levers were first used by Rogers in 1844.

These two improvements, which are absolutely essential to the success of railways in new countries, and have been adopted in Canada, Australia, Mexico and South America, to the exclusion of English patterns, are also of great value on the smoothest and best possible tracks. The flexibility of the American machine increases its adhesion and enables it to draw greater loads than its English rival. The same flexibility equalizes its pressure on the track, prevents shocks and slows, and enables it to keep out of the hospital and run more miles in a year than an English locomotive.—*From "The Building of a Railway," by Thomas Curtis Clarke, in Scribner's Magazine for June.*

**A POCKET MINE.**—The Bonanza mine has been doing well again. We learn from high authority that since our last interview, two weeks ago, that a considerable quantity of gold has been taken out, making altogether about \$50,000. The rock furnishing this last gold was highly sulphureted with copper and iron sulphurets, besides being attended with arsenical pyrites. The material was run through Mr. Ferguson's mill first and as much gold as possible, then the residue, or sand, was subjected to Mr. Louis Blanding's metallurgical process. It appears that the crossing, the contact of which with the lead makes the gold, has divided and gold was found on both divisions of it. The parties are not sinking at present, but are steadily, intelligently and systematically following the branches of the crossing upward. Ultimately their operations may extend eastward a few feet from the present workings. Never before in this county has ground been so thoroughly studied, has the elates, the changes, the matrix and the sulphurets been subjected to so close an examination, and their influences so clearly interpreted, as in the present instance. This mine has had its history read a dozen times or more, and oftentimes has prediction and speculation announced that the "bottom has dropped out." But it has lived through it all, and at intervals when mining opinion was against it has arisen like a thing conscious of its power and its duty unto its owners.—*Tuolumne Independent.*

The miners of the Bulwer and Standard mines, Bodie, have had a row over some mining trouble of the respective companies. A bulkhead on the 200 level was blown up and some pistol shooting indulged in. No one was hurt. The Miners' Union of the town called a meeting, sent for the superintendents of both mines, and informed them that there must be no more shooting, blowing up of bulkheads, or any other business of that kind, endangering the lives of miners; that they must settle their differences in the courts.

**A NEW AND POSSIBLY USEFUL ALLOY.**—A correspondent of *The English Mechanic* gives the following recipe for a curious alloy: "Put into a clean crucible an ounce of copper and an ounce of antimony; fuse them by a strong heat and pour the alloy into a mold. The compound will be very hard and of a beautiful violet hue. This alloy has not yet been applied to any useful purposes, but its excellent qualities, independent of its color, entitle it to consideration."

#### The Borax Mining Companies.

Owing to the assignment of the house of Wm. T. Coleman & Co., the borax companies which he controlled were also compelled to assigned. Detailed statements of the assets and liabilities of these companies have been filed with the County Recorder.

The summary of the financial condition of the three companies is creditable, in that the assets of each far exceed the liabilities. The combined assets of the three corporations aggregate \$1,598,543.70, while the combined liabilities amount to only \$547,316.17, or a little more than one-third the value of the assets. The excess of the combined assets over the combined liabilities is \$1,051,227.53.

The following detailed statements show in brief form the condition of each company and the items comprising their debits and credits:

##### The Harmony Borax Company.

The statement filed by the Harmony Borax Co. shows the financial status of that corporation to be as follows:

**Assets**—Mining property known as the Wintere Borate Deposit Placer Mining Claim in Death Valley Borax and Salt Mining District in Inyo county, \$75,000; Desert Borate Deposit mine, \$100,000; ranch of 640 acres, \$10,000. Borate mines—Ancient Lake, \$10,000; North Columbia, \$125,000; Mushroom, \$600; Neel Consolidated, \$140,000; Stevens, \$10,250; Borax Extension, \$250; Centennial, \$250; improvements and personal property connected with the Coleman Borate Deposit Plant in Inyo county, \$40,298.18; improvements, etc., on the Calico Borate Deposit Plant in San Bernardino county, \$4936.73; property of teaming department in Kern county, \$32,572.17; property in Alameda county, \$2607.24; borax pledged to Wm. T. Coleman & Co. by delivery of warehouse receipts to secure balance of account for advances, \$80,050.59; borax consigned to W. T. Coleman & Co., but not accounted for up to May 8th, \$27,778.55; claim against Borax Board, San Francisco, \$10,000; borax on route from mines and refinery and at Alameda Point, \$30,362.65; boracic acid, etc., \$21,317.50; cash in Bank of California, \$2379.75; claim against W. T. Coleman, \$5298.20; claim against Meridian Borax Co., \$1092.65; merchandise en route to New York, \$1850.28; office safe, \$300; total assets, certain and contingent, \$732,170.49.

**Liabilities**—Forty-nine drafts, drawn by the Harmony Borax Co. upon Wm. T. Coleman & Co. from January 4, 1888, to March 17, 1888, (liability on the same being wholly contingent upon said drafts having been negotiated), \$172,550; balance of account in excess of foregoing drafts, \$14,660.98; sundry creditors for labor, etc., \$4836.05; California Chemical Co., \$6928.06; Harmony Mining Co. (in San Francisco), \$3011.64; Henry Clay Mining Co., \$11,686.79; total liabilities, \$213,973.52.

**Recapitulation**—Assets, \$732,170.49; liabilities, \$213,973.52; excess of assets over liabilities, \$518,196.97.

##### The Meridian Borax Company.

A summary of the financial affairs of the Meridian Borax Company is embraced in the following statement:

**Assets**—Mining property of the Meridian Borate Deposit Placer Mining Co. in Inyo county, \$150,050; South Meridian borate mine, \$200,000; Lowland borate mine, \$100,000; Played Out borate mine, \$1000; White Monster borate mine, \$2500; Hard Scramble borate mine, \$500; Lizzie V. Oakley borate mine, \$3000; Widow borate mine, \$2500; Flag End borate mine, \$2500; East Coleman borate mine, \$20,000; Lila C. borate mine, \$10,000; Biddy McCarthy borate mine, \$2500; Grand View borate mine, \$5000; Mammoth Queen borate mine, \$3000; contingent claims against W. T. Coleman & Co., depending upon the fact by whom payment of certain drafts drawn upon W. T. Coleman & Co. and accepted by them is made, \$155,232.03. Total assets, certain and contingent, \$657,832.03.

**Liabilities**—Forty-seven drafts drawn by the Meridian Borax Co. upon Wm. T. Coleman & Co. from Jan. 4, 1888, to April 20, 1889; liability on the same being wholly contingent upon said drafts having been negotiated, \$170,750; due Harmony Borax Co., \$1092.65. Total liabilities, \$171,842.65.

**Recapitulation**—Assets, \$657,832.03; liabilities, \$171,842.65. Excess of assets over liabilities, \$485,989.38.

##### The California Chemical Company.

A tabulated statement of the assets and liabilities of the California Chemical Co. is as follows:

**Assets**—Real estate and buildings, \$25,000; mill, fixtures, and machinery, \$19,358.18; due from Harmony Borax Co., \$6928.06; contingent claims against Wm. T. Coleman & Co., depending upon the fact by whom payment of certain drafts drawn upon W. T. Coleman & Co., and accepted by them, is made, \$157,254.94. Total assets, certain and contingent, \$208,541.18.

**Liabilities**—Forty-nine drafts drawn by the California Chemical Company upon Wm. T. Coleman & Co. from Jan. 12, 1888, to May 6, 1888, liability on the same being wholly contingent upon said drafts having been negotiated, \$161,500.

**Recapitulation**—Assets, \$208,541.18; liabilities, \$161,500. Excess of assets over liabilities, \$47,041.18.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Ocalaveras.

**THE CALIFORNIA MINE.**—*Chronicle*, May 26: Work is progressing favorably at the California mine, situated about three miles north of railroad, and owned by Messrs. Lamphear & Putnam. The tunnel is now in a distance of 100 feet, which taps the ledge at a depth of 80 feet from the surface. The vein at that depth shows one foot in width and carries free gold and sulphurets. The owners have recently put up an arastra for the purpose of prospecting the vein thoroughly.

#### El Dorado.

**SATURDAY MINE.**—*Placeriver Observer*, May 22: The Saturday mine near Nashville, in this county, has been opened by shaft and cuts, showing the ledge to be 151 feet wide from wall to wall apparently well defined. The grade of ore the whole width of the vein has not been determined, but if it should be even low grade, with the facilities for working, it can be made a very profitable mine. Free gold is visible in the openings across the vein. The outlook for this mine is certainly promising.

**SLATE.**—It is reported that the California Slate Co. are preparing to ship a large quantity of slate to Oakland and San Francisco. This slate is of a quality equal, if not superior, to anything of the kind found in the United States, and its production will prove to be an industry of great importance to this county.

#### Inyo.

**DEEP SPRING.**—*Inyo Register*, May 24: The mining outlook in the Deep Spring region, across the Inyos, is looking up considerably. The Cliff mine, owned and worked by Greenly & Broder, is well opened by three or four tunnels, all on the ledge from 100 to 200 feet, with a fine showing of high-grade ore ready for stoping in every one. Two tons or more of ore, ready sacked on the dump for shipment, will go about \$1000 per ton. Turner and partner have a mine near by from which they will soon make a small shipment of similar high-grade ore. Payson & Bro., at the lower end of the valley, have out a carload or more of silver-lead ore ready for shipment. At Palmetto, further east, a new silver mill is in the course of erection, while active work is being carried on on quite a number of mines in the vicinity—gold, silver, and silver-lead, the former for Murphy's steam arastras, for which the prospects are said to be very good indeed, as will be those of that entire section when the new mill gets under steam, which will be the case in about two months.

#### Monterey.

**LOS BURROS MINES.**—*Salinas Index*, May 26: The Cruikshank mine continues yielding rich ore. The lower tunnel intended to drain the mine is now in about 80 feet. Other claims are prospecting well. Goods are packed into the mines from Jolon at prices ranging from 1½ to 2 cents per pound. The cost of going from Salinas City to the mines is as follows: By rail to Kings City, \$1.45; by stage from Kings City to Jolon, \$2; supper, bed and breakfast at Jolon, \$1.50; thence by horseback to the mines, \$3; total, \$7.95.

#### Nevada.

**THE CENTENNIAL DRIFT MINE.**—*Nevada Transcript*, May 25: Supt. Henry Richards of the Centennial drift mine between this city and Washington was in town night before last. Prospecting operations at this mine are going along nicely. All of the water having been pumped out from the 400-foot shaft, the work of extending the drift, which is now in 500 feet directly south from the shaft, was resumed last Monday. This drift is under the bedrock to which upraises are made every 100 feet. The bedrock is pitching and the last upraise made reached it within a much less distance than the preceding one. Supt. Richards does not have much to say, as he is too old and good a miner to say there is gold in a given place till he has dug into that place, but his manner indicates that he expects to have some news about the Centennial before many weeks have elapsed. The Centennial Co. has been searching for that channel about 14 years, and the hunting has cost them not less than \$125,000 in hard cash.

**QUARTZ.**—*North San Juan Times*, May 19: The quartz mine of D. R. McKillican & Co., situated 11 miles northeast of this place, is being steadily and energetically worked under the superintendence of the first-named gentleman. The ledge is of the "pocket" class and yields well when its pockets are tapped—more than can be said of some pockets of another class that we wot of. The company has been driving a tunnel for the purpose of striking the ledge at an unexplored point, and Sunday morning last the ledge was encountered in the face of the tunnel. Although, generally speaking, only the pocket portions of this lode will warrant milling, Mr. McKillican thinks, if further work develops a continuance of present indications, every pound of rock between the ledge's walls will pay to put through the mill. The hoisting works, mill, etc., in connection with this mine are first-class in every respect, and will not suffer by comparison with the mining plants of more pretentious companies than the one herein referred to. The enterprise of this company in the face of difficulties seemingly insurmountable is worthy of emulation by other quartz men in this county.

**THE PROVIDENCE.**—*Nevada Transcript*, May 23: It will be gratifying news to the community to learn that the Providence Mining Co., of this city will soon again be in full operation. The force of employees is being gradually increased, and by the end of this month the mine will have resumed its old-time activity. A dry house is being built and other improvements about the property are being made preparatory to the resumption of operations. The Providence has for many years been the leading mine of this district, and good judges say it will continue to be so for many years to come.

**WASHINGTON DISTRICT.**—*Foothill Tidings*, May 23: From J. G. Fredenburr, the well-known prospector of Washington district, who was in this city to-day on business, we learn that the mining section from which the gentleman hails has to-day better prospects than ever before. Several good mines are

being developed, and prospectors may be met with on all hands. Thirty men are employed at the Washington mine and the output is considerable. Day and night the 20-stamp mill is steadily engaged. As depth is attained, the ledge improves in quantity and quality, a characteristic of the quartz veins of the district. Across the Yuba is the Blue Bell, owned by Tregidgo & Von Schroeder, who, by the way, also own the Washington mine. Fifteen or eighteen men are employed here, and the ore is high grade. The capacity of the ten-stamp mill is to be doubled, and new rock-breakers and other improvements are to be made. Some 30 men are in the employ of the Yuba Co., a property not unknown to Grass Valleyans as experiencing numerous ups and downs. The shaft on the Yuba is now 800 feet in depth and the lowest level on the vein is in 300 feet. At the shaft the level shows a four-foot ledge of very good ore, and at the face of the level the ledge is seven feet thick and the ore is of even better quality. The mine is yielding good profits, and the outlook justifies the erection of a more powerful air-compressor for operating the pump and driving drills—an improvement which has been decided upon. A mile and a half south of the Yuba, at a higher altitude, this same company is again prospecting the Last Chance claim, owned by it. Here the indications are considered favorable. Three or four years ago more or less development work was done on the Last Chance. A promising claim is the Daylight, situated on Haldenson Flat. A Mr. Haldenson and three others are the owners and are pushing prospect work. When work was first started there was only a very small but rich stringer in sight; now a three-foot ledge of good ore is being worked and a five-stamp prospect mill has been constructed in a convenient situation. The Croesus is owned by Mr. Fredenburr, C. W. Kitts and others. Former development work consisted wholly of a 180-foot tunnel which tapped the vein at too high a point and consequently proved of no practical use. Mr. Fredenburr is now personally conducting operations. He has caused a shaft to be put down in the tunnel and the ledge proper to be uncovered. It is of good size, and the quality warrants developments upon a larger scale and the construction of works. Although paying dividends, the Spanish mine is not yielding so profitably as was the case a few months ago. This is accounted for by the fact that the management extracts and crushes all the ore—does not grade it. It is here that ore is extracted and reduced at an average cost of 60 cents a ton. Nothing is being done at the Eagle Bird—perhaps the richest mine in the district. When shut down because of the financial difficulties of the owner, Shattuck of San Francisco, the output was very high. Litigation for the possession of the property is still in progress.

**GRANTVILLE BELT.**—*Nevada Herald*, May 28: The numerous shipments of machinery to the Rocky Glen mine show that the owners mean business. Since the mine was bonded last year, development work has been going on steadily and the result has proven satisfactory, or more machinery for a larger plant would not be ordered. The success of this mine has given a new impetus to that whole section. The success of the California mine has also done much to increase confidence. These two mines are, without doubt, very promising properties. Between the two—and in fact on both sides of them—north and south, there are numerous quartz mines that have been worked and some of them showed as well as either of the two. The rock in the Eureka district is high grade. Several of the ledges have paid about \$40 per ton, and the average is considerably above \$5. Water is abundant in that section and many of the claims are so situated that it can be utilized for power. There is a great field there for the prospector and the capitalist, who wants to develop mining property.

#### San Diego.

**JULIAN DISTRICT.**—*Julian Sentinel*, May 19: The recent rush to the alleged gold fields in Lower California is "busted." Capitalists and prospectors are now turning their attention to the rich strikes being made almost daily in the Julian district. Every stage and private conveyance that comes in brings with it prospectors, who all come prepared to stay. A rich lead was found this week about six miles from Julian, full particulars of which we will publish next week.

**GOLD AT CARLSBAD.**—*National City Record*: There is much excitement at Carlsbad over the opening of an old mine that was abandoned 20 years ago by Capt. Louis Rose of San Diego. An old Colorado miner came across the mine recently and relocated it with Mr. F. D. Mitchell. They now have 2000 tons of ore on the dump, running well in silver, copper and gold. The mine was abandoned because it cost too much to transport the ore. Now that railroads run so near the property it is claimed that the ore can be handled at a profit. Hundreds of people are flocking to the place and the whole adjacent country is being staked out.

**GOLD KING.**—*Julian Sentinel*, May 26: The new gold find, is located on the land owned by Messrs. Fish & Thousstrup. We found Messrs. R. G. Melrose and F. E. Feeler hard at work—digging out the quartz and the other testing it in a mortar. The rock they are now taking out averages \$300 to the ton. Two shafts are being put down, and it is probable that hoisting and reduction works will soon be built. We were shown a piece of rock about the size of a man's hand that contained in the neighborhood of \$30 in gold.

**STONEWALL MINE.**—*Julian Sentinel*, May 26: The shaft from which ore is now being taken is 230 feet deep. About 60 men are employed around the works, and work goes on day and night and Sunday, month in and month out.

#### Sierra.

**WALLIS CONSOLIDATED.**—*Sierra Tribune*, May 26: Arrangements are being made, whereby work upon the Wallis Consolidated Co.'s ground will be inaugurated. The company has been reorganized, and under the new deal there is no doubt that the 1420 acres of valuable ground lying along the Henness Pass ridge will be thoroughly prospected. The first move of the company will be to run a tunnel into the ridge at a point just above the old Ironides quartz mine. The ridge is narrow there and the expense of getting into it will be quite light.

**PROSPECTING.**—John Casserly, Hugh Murray and Henry Johnson are prospecting what they have named the Bamboozle gravel claim. It adjoins the Wide Awake Co.'s ground. The boys propose to

push ahead the work of opening up their claim and are confident of striking something good.

**THE SAN LOUIS MINE.**—Ed. Lawrence, Martin Carroll and Joseph Mondozi on Saturday last paid a visit to the San Louis mine. No. 3 tunnel is now in 285 feet, the last contractors having completed 96 feet of the same.

**GOLD.**—*Mountain Messenger*, May 26: To show how the gold is scattered in these mountains we mention an incident: Last Sunday morning, while Mr. and Mrs. Hardy were weeding in their garden, about a mile above town, when near the porch of the house, Mrs. Hardy picked up a piece of pure gold, which weighed \$55. The ground on which the garden is made, the natural formation, was worked out years ago, the rocks being leveled off and soil filled in to make the garden.

**WALLIS CON.**—Work will be begun on the Wallis Consolidated claim at an early day, by opening an old tunnel run into the ridge many years ago.

#### Shaeta.

**WATER-POWER.**—*Shasta Democrat*, May 23: The 200-horse power water-wheel, pipe, etc., for the Calumet Mining Co. have arrived and been transported to the works. The wheel is the Knight patent, with all modern improvements. It will be remembered that this company bought the Spring Creek ditch, which has the first right to the waters of Spring creek, which, for nearly every month of the year, will furnish 500-horse power. This company intends, as soon as the present mill is started, to enlarge the plant to the full extent of the water-power available. When completed, Shasta county can boast of not only the largest mill in the State, but the most complete mill for saving all the valuable parts of the ore. The Calumet Co. owns several mines, with a railroad about finished, connecting the mines with the mill.

#### Trinity.

**EAST FORK.**—*Journal*, May 26: Capt. Trueworthy returned from East Fork and reports everything flourishing. He has put men to work on the Belle mine in which he is interested. He says two men have been put to work on the North Star mine getting it into shape. No work has been done on this for some time. Work is being pushed on nearly all the mines in the district.

**THE BONANZA MINE.**—Mr. Wm. Welch was in town this week. He is going to Minersville to resume operations on the Bonanza quartz mine, he and Fred, Grotefend of Redding having a lease on it. They feel confident that there is a good ledge there with plenty of gold in it.

**ON THE ROAD.**—Capt. Weaver returned from San Francisco Thursday evening, having purchased and shipped a 5-stamp mill for the Golden Chest mine at East Fork. The entire machinery has already reached Redding, and one wagon-load left there Thursday morning. It will be taken directly to North Fork from where it will be packed to the mine immediately. In a few weeks the dropping of the first stamp will be heard in the prospective leading mining camp on the coast.

**QUARTZ ON STEUART'S FORK.**—Mr. John H. Smith returned Friday from Steuart's Fork, where he has been prospecting for the last three weeks. He brought with him a sack of quartz specimens from three ledges on which he has locations; the quartz is fine-looking and carries free gold and sulphurets, the sulphurets being very rich. A small piece we saw crushed and burned out yielded a handsome prospect. Mr. Smith discovered the ledge last fall but was compelled to leave that neighborhood, as it is too high for a pleasant winter resort. He will return soon and get his locations into shape for working.

#### Tuolumne.

**QUARTZ MINING.**—*Union Democrat*, May 26: Mr. Ferguson's mill was the early part of the week running on rock from the Italian mine. It is reported that the Soulsby mine, which has for some time past been inactive, is about to resume its old time vigor and productiveness. It is rumored that the Keltz mine, situated about 13 miles easterly from the Sonora, has been bonded by an English company and will in due time resume operations. This mine at one time was very rich and yielded handsomely. The Hyde mine and mill are in operation again. This week after 2½ days' run two ounces and over of amalgam were collected from the plates on the outside of the batteries. Mr. Hyde thinks that this summer the mine will give forth big results. John Neal, Esq., has nearly completed the erection of his mill on Portuguese gulch. He thinks that in a few days it will be ready for operation. It is a Huntington mill and has a capacity of five tons per day. The water to run it will be taken from the Tuolumne Water Co.'s ditch. The Mono quartz ledge, situated about seven miles from Sonora and near the Mono road, has been bonded by Mr. W. Sharwood and operations have been commenced. The contract for the digging of the ditch from Middle Camp to the Eureka Consolidated mine has been let in sections and the work was commenced this week. The ditch will be nine miles in length. Messrs. T. Hill, N. Baule and F. Williams have leased the lead of Mrs. Dorsey in her yard. They have sunk a shaft down about 30 feet and we understand that it prospects very well. Should they find slate, which no doubt they will, there is every evidence for the development of a bonanza, as the lode is large, regular in its bearing and somewhat sulphureted. This is the same lead as the Bonanza mine, and there is no reason why it should not do as well where the above parties are working.

**A TEST.**—*Independent*, May 26: Mr. Frank Benjamin is having some 20 tons of rock hauled to the little custom-mill of Mr. John Ferguson, from Italian Camp, to make a test of the same. This new mill will be a boon to many, who can have their quartz tested without running into the expense of building a mill before they know whether the rock will pay. The sound of stamps rattling away the whole day long puts a business racket into the air of the upper end of town.

#### NEVADA.

#### Washoe District.

**CON. CAL. AND VIRGINIA.**—"Superintendent's Report," May 29: On the 1435 level the usual quantity of good ore is being extracted from stopes opened out around the winze sunk below that level. From the stopes at the north end of the main north drift a west crosscut is advanced 34 feet in quartz,

which carries some value. Ore of good quality continues to be extracted from the stopes opened out on this level. On the 1600 level ore of good quality is being extracted from stopes around the upper part of upraises Nos. 1 and 3 carried up above the floor of this level.

**SAVAGE.**—Ore shipments average 80 tons daily; pulp assays showing a value of \$25 per ton. Have begun stoping ore stripped by the 400 level south drift, which has reached the south line. Bullion on hand and shipped on May account, \$28,000.

**MEXICAN.**—On the 1300 level from the north drift, at a point opposite west crosscut No. 2, and east crosscut No. 1, is advanced 47 feet. Both crosscuts are now in vein porphyry and clay.

**GOULD & CURRY.**—From the 250 and 300 levels we have extracted 224 tons and 900 pounds of ore during the week, pulp assays of which show an average value of \$28.49 per ton.

**UTAH.**—On the 372 level, in the west crosscut, 75 feet from the upraise top, the south drift is out 223 feet and continues in clay, porphyry add quartz, showing some value.

**SIERRA NEVADA.**—On the 520 level of the drift running southwest from the main north drift, and latterly turned in a south course, is in clay and porphyry.

**HALE & NORCROSS.**—Ore shipments for the week aggregate above 1400 tons, showing an average value by pulp assays of \$37 per ton.

**BEST & BELCHER.**—On the 425 level the west crosscut from the main north drift is in 63 feet, showing porphyry.

#### Aurora District.

**AURORA'S HOPE.**—*Esmeralda News*, May 26: As it was stated last week, the strike in the Durand mine, Aurora, is considered very rich. The owners of the mine are now running a tunnel on the vein in the Live Yankee, as also one on the Antelope to tap the vein, which they expect to do by the 1st of July. Superintendent Colcord of the Durand, in company with A. E. Aon, one of the directors, departed for San Francisco last Sunday. While at the Bay city a concentrator and other machinery necessary to put the Del Monte mill in first-class working order will be purchased, when a force of men will be employed to overhaul the mill and put it in readiness to work the quantities of ore now being extracted from the mine. Mr. Ann, who has been visiting Aurora for the past two weeks, is very well pleased with the prospects, and is of the opinion that Aurora will now boom as it never has before, for the strike in the Durand has already had an encouraging effect for a number of other mine owners in the district are talking of putting men to work on their claims. The point where this last rich discovery was made is said to be fully 100 feet deeper than any place where ore has yet been taken out of the Aurora mines. There are now 31 men employed in and about the mine, and the prospects for the force being greatly increased are very favorable. The hoisting works are nearly completed, and everything will be in such shape within a few weeks that there will be no excuse for not pushing the work in the mine vigorously.

#### Belmont District.

**HOPEFUL.**—*Belmont Courier*, May 19: Belmont will see livelier times this year than it has for years past. A resumption of work in the mines of East Belmont would indeed cause a boom that would gladden the hearts of those who have pinned their faith to this district. Good times are sure to come and see this section of Nye county again—and they will come to stay.

#### Eureka District.

**ORE SHIPMENTS.**—*Eureka Sentinel*, May 26: The following number of tons of ore were shipped from the mines of the district to the furnaces during the week: Prospect Mountain Tunnel, 8 tons; Morrey, 8 tons; Woodchopper, 23 tons; Featherstone, 12½ tons; Maud, ½ ton; Williamsbury, 8½ tons; Buellbacker, 7½ tons; Ruby Hill Tunnel, 6½ tons; Banner, 9½ tons; Paul Pry, 4½ tons; Geddes, 25½ tons; McNaughton, 4 tons; May Lode, 6 tons; Giles Weller, 6 tons; Altoona, 3 tons; and Leonie, 10 tons.

**RUBY HILL TUNNEL.**—Messrs. Heubner and Scheuch have been working on a lease the Mary Aino mine, one of the Ruby Hill Tunnel claims, and came in town a few days ago with a shipment of low-grade ore to the furnaces. They brought with them a chunk of very rich-looking ore which they took from a streak discovered by them last Monday. This streak is about 10 inches thick, and is coming in at the bottom of the mine workings. The Ruby Hill Tunnel claims have been prospected but very little from the surface, the big tunnel penetrating the series being the only opening in their extensive property from which extended explorations can take place; but if their strike should prove valuable, the entire hill will soon be swarming with men anxious for tribute pitches. The company have enough ground to place on tribute nearly every miner in Eureka district.

#### Hawthorne District.

**LOCATIONS.**—*Walker Lake Bulletin*, May 23: W. A. Johnson, who has been prospecting for some weeks in Hawthorne District has made three locations, all of which show excellent prospects and are of the same quartz formation. He has one location adjoining Fred Webber's mine, the Lena, on which the croppings show signs of an excellent ore body.

#### Jett District.

**SILVER.**—*Belmont Courier*, May 19: Assays of ores from Idlewild mine, in Jett District, show that last week's statement regarding the value of the ores was about correct. The silver running from 35 ounces to 75 ounces and the lead 53½ per cent, no better showing for smelting plant can be found in Nevada. Wood and water in large quantities are found close to the mine. Even with the high rates of transportation and the low price of silver such an enterprise economically and judiciously conducted would pay.

#### Palmetto District.

**ACTIVE.**—*Walker Lake Bulletin*, May 23: At Palmetto everything is bustle and activity. Work on the new mill is progressing rapidly and it will be in operation next month, and that place shows flattering prospects for a bright and prosperous future. At Pigeon Springs, six miles distant, Charles Murphy's mill started up six weeks ago and has been running ever since, turning out more gold bullion than

REVIEW.—Salt Lake *Tribune*, May 25: The week has been cool and somewhat stormy; the output of ores and bullion rather light. The receipts for this city for the week ending May 22nd, inclusive, were for the value of \$116,352.47 of silver, \$45,327.93 was ore and \$71,024.71 was bullion. For previous week the receipts were \$37,254.43 in bullion and \$300,007.07 in ore. The Ontario product for the week was of bullion, 24,469 fine ounces; ore sales \$106.35, an approximate total of \$35,375.35. The Daily output for the week was sixteen bars of bullion, 22,321.50 fine ounces; ore sales, \$5677.93; total approximately, \$28,899.93. The Horn Silver at Frisco makes no mark in the local mining world. Fine bar receipts in this city for the week were to the value of \$44,381.44. The Hanauer smelter produced during the week bullion valued at \$14,640.00 in Germany, \$2,003.27 in bullion. Ore receipts in this city for the week were \$19,967.93 by Wells, Fargo & Co., and \$25,360 by McCormick & Co.

## SCIENTIFIC PROGRESS.

## How One Sense Sharpens Another.

SOME interesting experiments on the reciprocal influence of organs of sense have been recently made by Herr Urbanschtch of Vienna. His general conclusion is that any sense excitation has for result an increase of the acuteness of other senses. Thus, sensations of hearing sharpen the visual perceptions. If colored plates are placed at such a distance that one can hardly distinguish the colors, and various sounds are then produced, the colors become generally more distinct the higher the sounds. Similarly, one can, while a sound affects the ear, read words which one could not read before.

Again, the ticking of a watch is better heard when the eyes are open than when they are closed. Red and green increase auditory perceptions, but blue and yellow weaken them. Several musicians, however, were agreed that red, green, yellow and blue caused an intensification of sound about one-eighth, while violet had a weakening effect. Taste, smell and touch are under like laws. Light and red and green color increase their delicacy, while darkness, blue and yellow diminish it. Under the influence of red and green, taste extends from the anterior border of the tongue to the whole surface. On the other hand, a strengthening of smell, taste or touch exalts the other sensitive perceptions. Specially interesting is the reciprocal influence of touch and the sense of temperature. If one tickle the skin with a hair and plunge the hand in hot water, the tickling sensation ceases; on the contrary, if the hand be placed in cold water and a part of the body tickled, the temperature is felt more vividly. Herr Urbanschtch finds in this reciprocal action an explanation of supposed double consecutive sensations through one sense.

**THUNDERBOLTS A MYTH.**—The utter fallacy of a very popular and very ancient belief, says *Iron*, London, was exploded at last week's meeting of the Royal Meteorological Society, when G. Y. Symons, in a communication on "The Non-Existence of Thunderbolts," proved by accounts of searches after them and the exhibition of specimens that there is no such thing as a "thunder bolt," so-called. The belief in the fall of material substances during thunder storms is merely the survival of the fiction of the mythical bolts which irate Jupiter hurled at his enemies. The flash of lightning is nothing but a large electric spark, an equalization of potential between two unequally or differently electrified bodies, and there is no more transmission of a thunderbolt in a storm than there is actual transmission of material substance when we send a message across the Atlantic. The author narrated the circumstances of the so-called thunderbolts which have fallen at various localities, in all of which, when careful examination and inquiry were instituted, the circumstances, as well as the materials, such as coal, furnace slag, an old cannon-ball, fragments of brick, etc., left no doubt of the fallacies involved in the statements made current. Mr. Symons, whose object it is to abolish the common use of the term "thunderbolt" as a fiction unworthy of modern knowledge, is quite right when he says that every one—and scientific men first of all—ought to help to drive the word out of use by investigating such statements when made and giving publicity to the results. The only wonder is that the attempt of extirpating a foolish belief was not made long ago.

**COCOANUT OIL IN SUGAR MAKING.**—In the West Indies much interest is felt, says the *English Mechanic*, in an alleged successful use of cocoanut oil in a prominent factory on the west coast as a new sugar-making agent. It is claimed that its addition to the pan prior to striking, at the rate, it is understood, of about a pint to the ton, produces an enormously increased return of sugar from the massecuite. Abnormally high figures have been given for the increase, but the *Colonies and India* says: "After making every allowance for unintentional exaggeration and want of true experimental conditions, it would appear that advantage really accrues from its use. As no chemical action would be likely to occur, this advantage probably lies in the ability to concentrate the massecuite further than under ordinary conditions, the lubricating influence of the oil facilitating the striking of the pan and preventing too tumultuous boiling at the finish. Nothing is heard of its use in making yellow sugar, and experience will have to show how far the color, taste and smell of the sugar will be influenced by it."

**ASTRONOMICAL PHOTOGRAPHS.**—It is believed that some astronomical objects can be studied to better advantage in photographs than by themselves. The brain cannot always take in the perceptions of the eye fast enough and the eye is not sensitive to images whose brightness falls below a certain limit. In photography a prolonged exposure may be made to compensate for deficiency in luminous power, and the sensitive plate being competent to respond to quicker vibrations than the eye, it is possible to obtain photographs of celestial objects radiating light, which the eye is not adapted to receive. While the moon has received much attention, the photographs taken of it by Rutherford 20

years ago have not been superseded. The power of photography to portray the nebulae has been thoroughly demonstrated. The art has been applied to the observation of comets, and may yet be brought into play for the paths of meteors, the discovery of new planets and other purposes now hardly thought of. After remaining stationary for years, "at a bound it has gone far beyond anything that was expected of it, and bids fair to overturn a good deal of the practices that has hitherto existed among astronomers."

**CONSERVE YOUR FORCE.**—Hammerton says: "It often happens that mere activity is a waste of time, that people who have a morbid habit of being busy are often terrible time-wasters; while, on the contrary, those who are judiciously deliberate and allow themselves intervals of leisure, see the way before them in those intervals and save time by the accuracy of their calculations." Another writer, unknown, says: "Some men are in incessant action, early and late, and all through the day. They have no time for family or friends. As for holidays, the less for them the better. They have inherited a nervous temperament, and are doing just the wrong thing with it—allowing it to hurry them to an untimely end. They wear themselves out. Their brain is ever in a state of morbid activity almost like that of an insane man. A little careful planning and a proper laying out of work, and especially doing everything in the proper time, would avoid all such hurry and worry, make work much easier, secure an abundance of leisure and greatly increase length of life."—*Scientific American*.

**SHADOWS ON THE WALL.**—A new and true art is claimed as a development of the familiar diversion of making rude figures by the shadows of the hands on the wall. Trewey, a French artist, has added great variety to these shadow pictures, and his fast-increasing list already numbers more than 300 new forms. By patient exercise he has given his hands great suppleness, enabling him not only to represent the most diverse figures upon a screen, but to give them motion and life. The swan smoothing its plumage, the bird taking flight, the cat making its toilet, the tight-rope dancer, who, after saluting the public, rubs chalk on her feet before walking on the rope, are among the silhouettes produced of such wonderful accuracy that one can hardly believe they are shadows of the hands alone.

**MARVELOUS INVENTION IN ELECTRICITY AND PHOTOGRAPHY.**—M. Leon Esquille, it is stated, has perfected a marvelous invention in electricity and photography. By speaking in a telephone transmitter, which consists of a highly polished diaphragm, reflecting a ray of light, this ray of light is set into vibrations, and a photograph is made of it on a traveling bag of sensitized paper. Now comes the wonderful part. If the image of this photographic tracing is projected by means of an electric arc or oxyhydrogen light upon a solenium receiver, the original speech is then heard. It is evident that there is no limit to the development of this peculiar combination of methods.

**A NEW COMET.**—What appeared to be a new comet was discovered at the Rochester Observatory, N. Y., on May 20th. What appeared at first to be an aurora was noticed in the north-west sky about 9 o'clock. The supposed aurora increased in length and brilliancy and was finally discovered to be the tail of a large comet. The direction was downward of the north. The tail was very broad at first, but gradually narrowed, while the light from it increased. Astronomers at Rochester cannot identify the comet.

**THE DEVELOPMENT OF FLAME BY HARD FRICTION.**—According to the *American Review* "it is a little known fact that hard friction can develop sufficient heat to inflame benzine vapor, especially if the surface rubbed be varnished with shellac." They had also been informed by a competent and truthful mechanical engineer that the head of a "soldering iron," which is well known, is far below "red heat," had in his own experience been sufficient to set fire to an escape of benzine vapor.

**TO REMOVE WATER FROM ALCOHOL.**—Gelatin is a good absorber of water, and will not dissolve in alcohol; hence if gelatin be suspended in alcohol it will absorb, practically, all the water present, leaving the alcohol nearly pure—at least as nearly absolute alcohol as can be obtained in any way short of careful distillation.

**THE NEW EXPLOSIVE MELLINITE.**—Government experiments with the new explosive mellinite, invented by Lamm of Stockholm, show that it is more powerful than dynamite. The explosion is quieter, scattering fragments less, and it is much safer to handle.

**POCKET RULES** have appeared in oxidized silver. They can be folded up small enough to be worn as a charm.

**A NEW ASTEROID.**—M. Charlois of Nice, France, discovered a new asteroid on May 3d. Its magnitude was 13.

**PHOTOGRAPHS ON METAL.**—A process has been discovered for producing photographs on metallic surfaces.

## MECHANICAL PROGRESS.

## English and American Iron-Making.

Mr. Wm. Farnworth, a well-known English iron-master of Swindon, in some recent remarks on the rapid progress which is being made in this country in the production of iron, more than intimated that the days of English iron-making were rapidly on the wane. He said that the fact that Pennsylvania ironmasters should be able to bring their coal several hundred miles by rail and their natural gas fuel 60 miles through pipes, and yet be able to compete against English iron, suggested a wonderful train of thought touching America's capabilities. "I fear," continued Mr. Farnworth, "that if Mr. Turner and Mr. Keep paint America's capabilities in rich glowing colors we shall have a great many of our rising young men going to America. Certainly, if I was 20 years younger, I should go myself to stay, as I have been to visit America."

The Mr. Keep mentioned is superintendent of the Michigan stove factory, while Mr. Turner is an English professor of metallurgy at Mason College in Birmingham, who has recently visited this country and on his return has dared to speak plainly to his countrymen of what he has seen in this country. The discussion took place before the Iron and Steel Institute, on which occasion a fine collection of samples of American foundry-work was exhibited. Much surprise was manifested by those present at the great progress which was shown to have been made by the American iron-founders. Admiration was expressed during the discussion at the low sulphur which appeared in the analyses, and our success in this particular was attributed in much part to the character of the fuel dealt with in America. Another point which occasioned expressions of great surprise was the circumstance that high silicon ores were produced from the clay-stoves. These stoves, Mr. Turner declared, were exactly the same stoves as exist to-day in South Staffordshire, and from which we never expect to get glazed iron. The silica in the American ore appeared to be very much higher than in the Staffordshire mineral.

## Rapid Work of American Furnaces.

The large production obtained at American blast furnaces created some uneasiness among the Staffordshire furnace-owners. It was admitted that America was in this respect "putting England in the shade," but it was urged in defence that considering the high-blast pressure used in America, something like eight pound to the square inch as compared with four pound or five pound in English practice, the American furnaces ought to produce 100 per cent more than those of the mother country. In support of the present practice in this country the opinion was quoted of the late Manchester meeting of the iron and steel institute, where this same question came up for discussion, that the rapid driving of America would not be found suitable to the ores and fuel available to the English pig-maker.

One speaker, however, remarked that an eight pound blast pressure had, he believed, been frequently adopted in Wales where an anthracite coal was used. Anthracite coal, too, always gave a low silicon iron. It was an absolute necessity to have a high blast when employing anthracite, and this was one of the great difficulties found in working anthracite in this country. It was remarked that we shall most probably have to remain content in England to see America go ahead in this matter of pressure. The much greater frequency with which furnaces were blown out and in in America, than with the English, was remarked upon as attributable to the same high-pressure driving.

## What Would Result From Free Trade.

It is hardly to be expected, remarked one of the speakers, that English pig-makers will submit to hearing the praises of American pig-manufacture sung in their presence without having something to say regarding American tariff duties. "If they were to come to free trade where would they be?" challenged Mr. James Roberts of West Bromwich, one of the largest chilled-roll makers in Staffordshire. "Is it not a fact that but for protection in America we could undersell them in all their home markets? We could send there millions of tons more iron than we at present produce if we had not to pay a duty of 45 or 50 per cent."

Mr. Farnworth declined to accept the challenge to enter into a discussion on the American tariff. Indeed, he questioned the wisdom of alluding to the matter at a time when the subject was so prominently before the American public. "Was it wise," he asked, "to allow the American ironmasters to see that we were at all anxious for a change in the tariff? The mountains of iron ore possessed by America and the rapid driving of her furnaces, would always give her advantages over England."

**COMBUSTION AND ITS MANAGEMENT.**—The Scientific Commission has reported that of 5,000,000 tons of coal annually consumed in London, 3,000,000 are combusted, and 2,000,000 go off in smoke and gas to create fogs and injure health and property. Doubtless, a like inquiry into the waste of fuel in this country would result in substantially the same conclusion, especially where soft coal is used. Our housewives do not realize that of every five cords of wood they burn, one is literally thrown away, and so of coal, but such is the fact. The

process of combustion is continually going on within us and around us. It is simply the union of the oxygen of the air with substances for which it has affinity. In our body the oxygen unites with the waste tissues of the body, and produces heat without visible flame. The rusting of iron is combustion, flammability, and without sensible heat. Though the supply of oxygen is as exhaustless as the air, of which it forms one-fifth part, yet not a surplus atom of oxygen enters into the process of combustion. There are two compounds of oxygen with carbon. One atom of oxygen unites with one atom of carbon, or two atoms of oxygen unite with one atom of carbon. Never an atom and a half of oxygen with an atom and a half of carbon. The union of these two elements is exact, entire and always the same under all circumstances.

**THE WORKING SURFACE OF A PULLEY.**—It has taken some time to settle the question in regard to belts made of leather as to which side should run next to the shaft wheels, and even now, is rehearsed occasionally for a mill man to dwell upon. It is a pleasure to see the best side of a belt stand out whenever a new belt is to be set in motion, and good looks go a great way on all such occasions, in spite of all the tests that have been made on leather belting. But nothing has ever been said of the extra cling that the flesh side gets by being easily squeezed into every depression on the face of the pulley, which the grain side has a tendency of bridging over. This seems to follow more in accordance with the laws of friction where the particles of one material have a chance to interlock themselves with those of another. Pulleys covered with leather, and wheels made of hard wood of all kinds have given much greater driving power from the same grasp of belt than nicely polished pulleys have done, made of metal, though this class of wheel has all the advantages that are to be derived from atmospheric influences. But the fine imperfections on a true surface, which are the real gear teeth of friction, is not there in the abundance found in the material that is closely allied with the helting itself. Everything would seem to indicate that a driving wheel is finished in the wrong direction when a covering of leather adds so much to its driving capacity. The teeth of gear wheels are not cut lengthwise of the driving face, and the slightest crease crosswise gives all the hold that its strength will allow. To turn off a pulley with the finishing cut taken crosswise and ground on a polish, herring-bone fashion, may not be appreciated in the machine-shop, but the object to be attained is the very one that a draw file is used for to pitch the minute grooves found on every surface in the right direction. —*Boston Journal of Commerce*.

**A NEW METHOD FOR PRODUCING STEEL PIPES.** Some two or three years ago, experiments were made in Germany by Herr A. Mannesmann, with the object of discovering a new method for manufacturing steel pipes, and these experiments were so successful that a syndicate was formed to erect works at Burbach, where the method, which is to be employed by the new company at the Old Steel Works in Swansea, Wales, has been in operation ever since. The patent rights granted to Herr Mannesmann, on the authority of the Berlin *Eisenzeitung*, were sold to Messrs. Funke & Ebers of Hagen, Germany, and to a large firm in Paris, who proposed to employ the process in the manufacture of copper tubes. An estimate of the importance of the new process may be gathered from the fact that the capital of the German syndicate was \$300,000. By the new method, the difficult and expensive process of boring is avoided, the tubes being cast by an adjustable core, which accommodates itself to the contraction of the metal on cooling, and thus prevents cracking. The steel cup obtained in this manner is then rolled in an ordinary train.

**A GIGANTIC ENGINE.**—A compound Corliss engine, of a gigantic description, has been produced at one of the Scottish foundries, designed for a cotton-mill in Bombay. According to the description the high pressure cylinder of this immense engine is some 40 inches diameter, and the low-pressure cylinder 70 inches, each having a stroke of six feet; and the fly-wheel, which weighs about 110 tons, is 30 feet in diameter by 8 feet 6 inches wide, grooved for 38 ropes, by which the power is transmitted to the various lines of shafting in the mill. The engine runs at the rate of 60 revolutions per minute, thus giving a speed of ropes of considerably more than one mile a minute. The crank shaft, made of the best Whitworth fluid compressed steel, is 25 inches in diameter in the body and 20 in. in the bearings. The steam pressure is rated at 100 pounds per square inch, and the engine works easily up to 2500-horse power.

**FLAT R. R. WHEELS.**—A potential danger of flat wheels not generally recognized was recently pointed out by Mr. C. A. Gilchrist, superintendent of the Fort Madison & Northwestern R. R. He said that in testing a bridge in the usual way with a heavy locomotive nothing unusual was shown, the deflection of the structure having been only one-fourth inch. But in the train hauled by the locomotive there was a flat wheel, and when it struck the bridge it caused a deflection of 1½ inches. The difference was so striking that it would be interesting and important for some road to investigate the extent of deflection due to flat wheels.

## GOOD HEALTH.

## Hydrophobia and Humanity.

Hydrophobia has been recognized for ages, and throughout all these ages has defied medical skill. The first known mention of it was in the manuscript of a Hindoo physician, Susruta, who lived nine or ten centuries before Christ. His account of it and treatment recommended—sacrificing—embodied all that is known today upon the subject, unless the findings of Pasteur are entitled to credence. Mention of hydrophobia was frequent after the beginning of the Christian era. Aristotle, Ovid and Pliny alluded to it. In the day of Nero it was observed and treated. According to Plutarch, in the time of Pompey the Great, it was first seen in human beings, and the distinction, still maintained by some authorities, between rabies and hydrophobia began to be made. Celsus Aurelianus, in the reign of Trajan, gave a detailed account of the disease and the controversies which had arisen concerning it. He told of a seamstress, when, in tearing with her teeth a garment worn by a patient, acquired hydrophobia and died. Then, as now, hydrophobia acquired by inoculation was regarded as necessarily fatal, but it had also been proved that many bitten by rabid dogs escaped any special inconvenience. Among the Arabs also the disease was known. Rhazes told of the barking symptom, which is simply a spasmodic cough, and of the fear of water, generally present when the subject is human and sometimes utterly wanting in the lower animals. Later, hydrophobia was freely discussed by European writers. The "Laws of Howell the Good" tell of a general outbreak of rabies, occurring in 1026. From that time it was recognized in England. Upon the continent it remained obscure until the thirteenth century, when 30 shepherds in Germany fell victims to it. It appeared near Boston in 1768; in the French West Indies in 1776. In 1785 it was alarmingly prevalent in the United States again, but in South America was unknown until 1803.

**INTELLECTUAL LABOR AND LONG LIFE.**—Among artists, Michael Angelo lived to be 90, Sir Christopher Wren to be 91. Titian is said to have been engaged in painting a picture now in the Academy at Venice where he was cut off by the plague at 99 years of age! Conrad Roppel of the Hague, who lived to be 100, and Iogree to 86, Tintoretto 82, Claude Lorraine 82, Greuz 79, David 77, Turner 76, Horace Vernet 73, Lebrun 71, Poussin 71, are instances not only of greenness in art, but greenness in enduring vitality. If we take poets, we find that Rogers lived to be 93, Sophocles 90, Coleridge 87, Juvenal 86, Anacreon 85, Voltaire 84, Metastasio 84, Euripides 78, Goethe 83, Klopstock 79, Wieland 80, Lamartine 78, Beranger 77, and Victor Hugo 83. If we turn to philosophers and men of science we find among our contemporaries M. Chevreul, the French philosopher and chemist, who on the evening of his one hundredth birthday occupied the President's box at the opera; and if we look into the past we find the names of Fontenelle, who died at 100; Hays (who wrote the treatise on whist) at 98; Hobbes at 92; Morgagni at 89; Ried at 86; Dr. H. Burden at 90; Sir T. Watson at 90 (?), Sir William Lawrence at 84; Rayer-Collard at 82; William Harvey at 80; Schelling at 79; Cousin at 76, and, greatest of all, Plato at 82; and among great composers, Auber died at 88; Cherubini at 82; Rossini 77; Haydn 77; Gluck 79; and Mozart 72. What a stupendous amount of brainwork, and brainwork of the highest kind, is represented by these names, all of whom exceeded the allotted threescore years and ten, but who are lost sight of in the delusive method of averages! Of the longevity of judges and dignitaries of the church, who also represent a great amount of useful brainwork, evidence has already been given.—*Nineteenth Century*.

**USE NO SUGAR ON OATMEAL.**—"Be careful how you eat oatmeal," said a doctor recently. "Oatmeal is a very healthy food if taken properly. No food is healthy if improperly used." "How should it be eaten?" "If oatmeal is eaten in excess of the needs of the body for proper nutrition, it overloads and taxes the system. It must not be eaten partially cooked. Flour, cornmeal, rice, and other approved articles of wholesome diet are not healthy if half cooked. If an excess of sugar or other sweets is used, it will disagree with many people, causing indigestion. If eaten with an excess of cream, it will not be healthy for some persons whose stomachs are too delicate to stand a rich food. Oatmeal is a healthy food when not used for overfeeding, when sufficiently cooked, and when not used with an excess of cream or sweets. Oatmeal should be eaten without any sweets, using a little milk or cream, a little butter, and seasoned with salt, as the Scotch do."—*New York Mail*.

**SELF-MASSAGE FOR DYSPEPSIA.**—J. N. Semple, in the *Herald of Health*, recommends self-massage as a remedy for dyspepsia. His method is as follows: "First thing in the morning and last thing at night rub the abdomen down the left side and up the right in a circle, also rub down the breast; now pace across the room once or twice, and then snap the lower limbs, like a whip-lash, for exercise. Now twist the lower limbs, first on one side, then on the other, and rock up on the toes. Now for the lungs and abdomen; first take in a half-breath,

then exhale all the air possible, then fill the lungs to their full capacity, walk across the room and back, at the same time throwing the arms back. Now in a half-breath send out every particle of air till you see the abdomen working like a bellows, and you will soon become a deep breather. For more extended practice in deep-breathing this morning before rising is a good time, provided there is full ventilation and the air inside is as pure and fresh as that on the outside. Before a good fire wash the hands and wet the back of the neck, arms and lower limbs slightly and rub down with a coarse towel. This is sufficient for a beginner, but entirely inadequate for the old, chronic dyspeptic.

## For Sprains.

**EDITORS PRESS:**—Take the strongest vinegar you can get; add all the salt it will dissolve. Heat and saturate flannel cloths, and apply to the hurt as hot as the patient can bear. Then envelop in dry flannel. Repeat the process every 10 or 15 minutes until the pain is relieved. As one of my ankles is just recovering from a severe sprain, I can testify with a clear conscience to the efficacy of this remedy. We have used it in our family ever since I can remember.—D. J. O., *Spadra, Cal.*

**GOOD AND BAD NEWS.**—Good and bad news has a contrary action on the heart. Bad news weakens the action of the heart, oppresses the lungs, destroys the appetite, stops the digestion and partially suspends all the functions of the system. An emotion of shame flushes the face; fear blanches, joy illuminates it, and an instant thrill electrifies a million of nerves. Surprise spurs the pulses into a gallop. Delirium infuses great energy. Volition commands, and hundreds of muscles spring to execute. Powerful emotions often kill the body at a stroke. Chilo, Liagoras and Sophocles died of joy at the Grecian games. The news of defeat killed Philip V. One of the Popes died of an emotion of the ludicrous on seeing his pet monkey robed in pontificals, occupying the Chair of State. The Doorkeeper of Congress expired on hearing of the surrender of Cornwallis. Eminent public speakers have often died in the midst of an impassioned burst of eloquence, or when the deep emotion that produced it has suddenly subsided. Lagrange, the young Parisian, died when he heard that the musical prize for which he had competed was adjudged to another.

**BIRD SKINS AS GRAFTS FOR WOUNDS ON HUMAN BEINGS.**—Dr. Redard has communicated to the Paris Academy of Medicine some observations regarding the advantages of the skin of birds for grafts on wounds of human beings. He takes the skin from beneath the wing of a chicken, carefully securing the subjacent cellular tissue, but avoiding the adipose tissue. The transplanted pieces varied from a sixth to a third of an inch in size, and they were maintained in position by means of a little cotton wool and iodoform gauze. The skin of birds and fowls has the advantage of being supple, delicate and vascular, and is readily adapted to the surface of a wound, where it adheres without undergoing absorption. In a case of severe burn of the scalp, of eight months' standing, in a child two years old, he obtained rapid cicatrization by means of grafts from a fowl. The wound measured 3 inches by 2½, and completely healed in two months.

## USEFUL INFORMATION.

**PREVENTING THE RUSTING OF SHEET IRON STOVES.**—In answer to an inquiry regarding the rusting of sheet-iron stoves, the following suggestions may be observed to advantage: The room where the stove is located may seem to be dry, yet be so cold as to condense more or less moisture upon the iron, and a rapid corrosion is the result. Covering up with paper has been frequently tried as the best method of preventing rusting upon the outside. If a heater drum rusts from the inside, as it is apt to do, it will be a good plan to disconnect it from the chimney and tie papers over the pipe-hole in the heater. This prevents draught through the chimney into the body of the drum, and prevents the formation of moisture upon the inside of the drum, as the air becomes cooled. If the heater could be disconnected all around, and have a dish of lime placed in the inside to absorb the moisture, there would be little trouble. All circulation of air through a heater or furnace should be prevented by closing all of the openings, and, above all, have all ashes and soot taken out as much as can be.

**AN ODD FACT ABOUT GUN COTTON.**—When gun cotton or other high explosives are freely exposed upon an iron anvil and detonated, says a chemical expert, the explosive leaves a deep and permanent impression upon the surface of the metal with which it was in contact. The impression produced by the exploding mass is an almost exact copy of that face of the explosive which was in contact with the metal. This is best observed with gun cotton, for, from the nature of the material, it can be shaped according to fancy, and such figures and designs as one wishes can be stamped upon its surface. Thus if a disk of gun cotton, on the face of which the letters "U. S. N." and the date "1884" are indented by detonated, it will be

found that the letters and figures will be reproduced in the iron, and, most singular of all these phenomena, they will be indented in the iron just as they were in the gun cotton.

**IMPROVED DIAMONDS.**—Many persons have been puzzled, says an exchange, to understand why the diamonds worn in earrings by ladies nowadays maintain such a ceaseless quivering motion. It makes no difference that the head of the wearer is in perfect repose, and that she is even speechless, and therefore exerting no muscle of face or features. The ceaseless twinkle of the diamond goes on, enhancing greatly the flashing beauty of the gem. The secret is in the setting of the diamond, and the method is a patented device. The patent is reaping a royalty of \$50 a piece from every manufacturing jeweler to whom he sells the privilege of using it. The stone is set in the usual manner, except that a band like the handle of a diminutive basket is attached to the frame-work. On the other side of the band is a cup-like cavity. On the lower part of the hoop is a projecting pin, pointed with rhodium, a metal which never wears out—something like the iridium with which gold pens are tipped. Now, when the diamonds are put into position on the hoop, the rhodium point projects into the cup. The result is what scientists would call a condition of unstable equilibrium. Like the pea blown with a pipe by a school boy, the diamond is given no rest, with the difference that no effort is required to keep it dencing. The metal point never wears out.

**PAPER BLANKETS.**—Many of our readers, says an English journal, will remember that a few years ago an attempt was made to introduce paper blankets, and the promoters of the scheme hoped that the great cheapness of their goods would lead to their very largely displacing the ordinary products of Dewsbury, Swerby Bridge and Witney. These hopes were, however, disappointed; no one could be induced to buy the paper blankets who could anyhow afford to pay for woolen ones, and little has been heard of the matter for some time. The idea has now, however, been revived in France by a Lisieux manufacturer, who claims to have invented a paper blanket at once cheap, warm, elegant, and very good for the health. We fancy he will have a good deal of trouble in establishing it in popular favor.

**VEILS OF SILVER THREAD.**—A strip of fine wire gauze is the newest thing in veils. It is as delicate as the dainty silk affairs which women persist in pulling down over their noses, and much less injurious to the eyes than the dotted or figured net so common upon the street. In appearance it does not differ at all from the ordinary, except, perhaps, it may be thought less flexible. The wire-gauze veil is not in the market, but women have brought a few from England, where they are beginning to be used, chiefly because they are better respirators than silk, which persists in choking one's breath and plastering itself down upon the face if the air is ever so little damp. A veil of silver thread is very ornamental.

**FLOWERS IN WATER.**—At a recent horticultural meeting flowers were exhibited in a glass filled with water and fitted with a wide and flat stopper. To the stopper the flowers were attached and then carefully introduced into the water in the globe, the stopper completely filling the mouth of the globe and being wide enough to stand safely. By turning the whole arrangement so that it stood on the stopper, the flowers were left completely surrounded by water. The water magnified the flowers, and a pleasing optical illusion is the result. Flowers thus immersed will keep twice as long as those in the air.

**SURFACE COLORATIONS.**—A Garman company has patented a process for producing surface colorations upon articles made of copper, zinc or brass. Upon the first-named metal it is possible to develop all the colors of the rainbow, and upon zinc the coating is formed of such thickness as to permit of chasing the surface. The most important application of this invention seems to be in the imitation of antique bronze, the results in this direction being very satisfactory, both in the matter of durability and resemblance.

**HOW TO PRESERVE EGGS.**—Take a teaspoonful of salt, and lime the size of an egg, and pour boiling water on them. When cold, drain off the liquor and put it on your eggs. If too strong, there will be a crust on top; if so, add more water. This is for two gallons of liquor. There is no receipt that beats this, and it can be relied upon. Eggs put down in August and used in April are just as fresh and make just as nice frosting as newly laid ones.

**HOW TO PREPARE A BLOTTER THAT WILL REMOVE INK.**—American *Druggist* tells how to prepare a blotter that will wholly remove ink spots from paper. Take a thick blotting paper and steep it several times in a solution of oxalic acid or oxalate of potassium. While the spot is still moist apply the prepared blotter and the ink will be entirely removed.

**IMITATION IVORY.**—Much of the so-called ivory now in use is simply potato. A good sound potato washed in diluted sulphuric acid, then boiled in the same dilution, and then slowly dried, is all ready to be turned into buttons, poker chips and innumerable other things that ivory was used for once upon a time.

## ENGINEERING NOTES.

## Stopping Railroad Trains.

To illustrate the importance of the prompt stoppage of railroad trains and the difficulty of securing them, various statements have been made. It is said that in one second a train traveling at 60 miles an hour passes over 88 feet; at 45 miles an hour, 66 feet; and at 30 miles an hour, 44 feet. The time required to move a distance of 100 yards is 3.4 seconds if the train is running at a speed of 60 miles an hour; 4.6 seconds if the train is running at a speed of 45 miles an hour; and 6.8 seconds if the train is moving at a speed of 30 miles an hour. The difficulties to be overcome in securing a quick stoppage, after the locomotive engineer endeavors to stop the engine, arise chiefly from the momentum of the train, which varies with its weight, the speed at which it was progressing and the grade of the line on which it was moving. Captain Douglas Galton, in a discussion of this subject, stated that "a train, through the locomotive, slowly accumulates energy, and for each ton of weight in the train the accumulated energy is equal to 120 foot-tons at 60 miles per hour, 53 foot-tons at 40 miles per hour, and 13 foot-tons at 20 miles per hour. Thus for a train of 15 vehicles, weighing 200 tons, the energy at 60 miles per hour is equal to 24,000 tons falling a distance of one foot, or approximately to the energy of a shot from the 80-ton gun."

Scientific experiments in England, made in 1875, demonstrated that with the hand brake then in use a train of a locomotive and 13 cars moving at a speed of 45 miles an hour could not be brought to a stand in less than one minute, or before the train had traversed a distance of half a mile.

In the closing months of 1887 practical proofs of the efficiency of the new system were furnished to large audiences of railway experts assembled at points near a number of leading cities. The average results of 11 of these tests were summarized in the following statement:

"A train of 50 cars of a total length of 1900 feet, weighing about 1,700,000 pounds, running 20 miles an hour, can be stopped by the use of hand by five men, all ready, and under the most favorable circumstances, in 1563 feet. By the air brakes, the same train, running at the same speed, can be stopped in 171 feet, or less than one-ninth the distance required by hand brakes. As in cases of genuine emergency the air brake is ready for immediate action, and the brakemen never are, it is fair enough to say that the air brake stops the train in one-tenth the distance required by hand brakes. The same train, running at a speed of 40 miles an hour, is stopped by the air brakes, in a distance of 646 feet. These stops are made with the braking power low, as it is to be used, in ordinary service, so that it will not elide the wheels of empty cars. With the braking power increased so as to make the quickest possible time, regardless of sliding the wheels, a train of 20 cars, running at 20 miles an hour, is stopped in 96.7 feet, and running 40 miles an hour is stopped at 388 feet."—*Railway Age*.

## A Wonderful Tunnel.

An engineering work that has taken over a century to construct can hardly fail to offer some points of interest in its history, and illustrate the march of events during the years of its progress. An instance of this kind is to be found in a tunnel not long since completed, but which was commenced over 100 years ago. This tunnel, or adit, as it should be more strictly termed, is at Schemnitz, in Hungary. Its construction was agreed upon in 1782, its object being to carry off the water from the Schemnitz mines to the lowest part of the Gran valley.

The work is now complete, and it forms the longest tunnel in the world, being 10.27 miles long, or about one mile longer than St. Gotthard, and 2½ miles longer than Mount Cenis. The height is 9 feet 10 inches and the breadth 5 feet 3 inches. This tunnel, which has taken so long in making, has cost very nearly a million sterling, but it appears to have been well spent; at least the present generation has no reason to grumble, for the saving from being able to do away with water raising appliances amounts to £15,000 a year.

There is one further point, however, worth notice, for if we have the advantage of our great grandfathers in the matter of mechanical appliances, they certainly were better off in the price of labor. The original contract for the tunnel made in 1782 was that it should be completed in 30 years and should cost £7 per yard run. For 11 years the work was done at this price, but the French Revolution enhanced the cost of labor and materials to such an extent that for 30 years little progress was made.

For ten years following much progress was made, and then the work dropped for 20 years more until the water threatened to drown the mines altogether. Finally the tunnel was completed in 1878, the remaining part costing £22 a yard, or more than three times as much as the original contract rate.—*Engineering*.

**ELECTRIC RIFLES** are the latest. Instead of the ordinary percussion firing device a dry chloride of silver battery and a primary coil will, so it was lately stated before the American Institute, fire the rifle 35,000 times without recharging.

## Passing Events.

The citizens of Helena, Montana, have set an example of enterprise in subscribing \$200,000 toward a big smelting plant in that city, which might well be followed elsewhere. It will have the effect of making quite an extended area of mining country tributary to that city. The works will be erected at once.

Electric power will shortly prove its efficiency on the Comstock lode. It is probable that after the results are properly realized it will be introduced elsewhere in that region.

A great deal of mining machinery is now being made in this city—more than for some time past. Considerable is being shipped to Australia and other points outside the United States.

There is more industrial activity in San Francisco at present than has been the case for

years. All the foundries and machine-shops are busy, and building operations are extensive.

Railroad building is quite active all over the State this season. New regions are being brought into market and settled up, and many towns, formerly isolated, now have railroad connection with centers of trade.

## The New Kingdom of Araucania-Patagonia.

A Mining Region of the Future—Brilliant Chances for New Commercial Relations.

The attention of this civilized world has been so constantly directed to the south and east of Europe during the past decade or two that the creation of a new kingdom in the southern extremity of the American continent is almost unknown even to the reading public. Yet such is the case, and it is the intention of this writer to briefly review the most important historical facts and to present a sketch of this country and its resources.

Araucania is immediately south and southeast of Chili, being separated by the river Bio Bio, extending southward to the German Colony of Valdivia and east to the eastward of the Andes. The coast line extends about two and a half degrees of latitude. The capital of the kingdom is Perquencot, and is inhabited chiefly by Europeans and Creoles.

In 1540, the Araucanians fiercely defended the holy cause of liberty against the Spanish naval forces of Philip II, commanded by Don Garcia de Mendoza and Pedro Valdivia. In 1573, Chili, as a State, was conquered by the Spanish and made subject to the Viceroy of Peru, but Araucania, through its conspicuous valor and skillful resistance, maintained its proper independence.

In ancient times the Araucanians consisted of a powerful confederation, divided into four principalities. Each principality was governed by its own chief, called *Toguis*, and each was independent of the others, except when uniting for deliberation in war against a common enemy, and for public welfare. The language is known as the Chilena, or Molucca, and the dominant religion a belief in a plurality of gods, similar, in some respects, to that of the ancient Greeks. They believe in metempsychosis and the immortality of the soul.

Patagonia, or Magellan's Land, was discovered by Magellan in 1519. It is a vast peninsular region, bounded on the east by the Atlantic ocean, on the south by the strait of Magellan—separating it from Terra del Fuego, on the west by the Patagonian Andes—leaving a narrow strip of undesirable, rocky land, controlled by Chili and Araucania, and on the north by the Argentine Republic. The northeasterly boundary is formed in part by the Rio Negro, the northern extremity of the country reaching to 34° latitude south, presenting a total length of territory of about 1100 miles. The total area of Patagonia, east of the Andes is about 300,000 square miles, while Araucania furnishes about 22,500 square miles additional.

The interior of Patagonia is inhabited by the Araucanians, or Puelchi, in the northern portion, and the Patagonians or Tuelchite, properly so called, in the south. In the north are immense forests of cypress, pine and oak, while the vast plains, extending eastward from the Andes, are covered with grass and shrubbery, and afford abundant pasturage for immense herds of cattle and horses.

The climate is mild and temperate in the north and rainy in the south. The lowlands are dry. Spring commences in September, summer in December, autumn in March, and winter in June. Epidemics are unknown, and the absence of venomous reptiles, is a marked fact.

A better idea of the climate may be obtained from the products, such as cereals and fruits, the former being even now raised in sufficient quantities to admit of exportation, and systematic agriculture has not yet been attempted. The fruits most raised are olives, figs, oranges, grapes and apples, while hemp, tobacco, etc., are grown without the slightest difficulty. Minerals and ores are abundant, the most important being copper, iron, nickel, antimony, tin, mercury, agates, amethysts, silver and gold. The most important silver mines, those which in ancient times yielded the greatest quantities of this metal, were closed at the time of the attack by the Spaniards under Mendoza, and

have not since been opened, fearing that their working would precipitate new attacks by Chili and the Argentine Republic with a view to conquest.

In this year 1853, says Comm. Talckes, the yield of gold reached \$60,000,000 francs (\$173,600,000), but at present the production is less than 500,000,000 francs (\$100,000,000). The MINING AND SCIENTIFIC PRESS, in its issue of December 4, 1886, states that Mr. E. L. Baker, U. S. Consul at Buenos Ayres, has furnished information respecting recently discovered gold-fields at the southern extremity of Patagonia. Several thousand claims have been disposed of to about 200 different persons, but it is said the best ground is owned by Messrs. Nield & Co. and Lezerna & Co. Mr. Baker says if it proves true that there is gold at Cops Virgenes it must be washings from the Andes, and that still farther inward it must be discovered in larger quantities. Parties are now prospecting the gulches nearer to the mountains. This way of approach from the east is from Buenos Ayres to Sandy Point via the Liverpool and Pacific steamer, thence by trail 150 miles to Cape Virgenes.

The hither way of reaching this country from the Pacific side is to take one of the steamers of the German line which trade between Hamburg or Bremen, and the Chili and Peru sea ports, and even as far north as Guatemala.

Perquencot, the capital, is situated in the northwest portion of the kingdom, east of the Andes, and, as has been stated, is inhabited chiefly by Europeans and Creoles—i. e., descendants of the former. There are excellent shipping points on the Atlantic seaboard, but the harbor at Valdivia, on the Pacific, is said to be one of the best on the west coast of the American continent.

On the 6th of November, 1860, the nation offered the royal crown to M. de Tournans, who was placed upon the throne of Araucania and Patagonia under the name of King Orelia Antonio I.

M. de Tournans was a chivalrous and learned French citizen, who, being a lover of science, was carried into this distant region for the prosecution of that study and the observation of natural phenomena. Affable but modest, courteous, gentle and charitable, he soon acquired the affections of the people, who subsequently elected him their king.

The first care of the new sovereign was to nominate a ministry; to give the people a constitution; to establish a succession to the throne in the line of direct descent; to establish the privileges of the king, and the unity of the people in the presence of the law. He divided the kingdom into departments and districts, under the control of prefects.

When King Orelia died without male issue, it became necessary for the country to elect a successor who should, in all respects, be as accomplished and as devoted to the welfare of the nation as the last Sovereign. Such a one was found in the person of M. Gustave Achille Laviarde, Prince of Aucus, Duke of Kialeon. The nation acknowledged and confirmed him the Sovereign of the free and independent State under the name of King Achille I. This act of recognition was officially confirmed by the chiefs and registered in Paris on the 26th of June, 1882.

Since that time Consulates have been established in various cities in Europe, and efforts are now progressing favorably toward recognition of the Kingdom by the Italian Government. It is also learned from foreign journals that a company of wealthy merchants are endeavoring to obtain from the King permission to colonize certain portions of Araucania, to cultivate such cereals and fruits, and to secure hides, wool, and ostrich (*Rhea*) plumes, for which they find an excellent market.

A prominent writer regarding this Government (in *L'Epee*, 1886), says: "France, through fear of becoming compromised with Chili and the Argentine Republic, is yet uncertain whether it ought to accord or not its protectorate to the people of Araucania and Patagonia, but it might in the end certainly intervene in this question, which is so warmly agitated, not only because they have solicited its protectorate through a chief who is French by birth and in heart, but lest it might repent too late the error committed when King Achille shall have accepted the protectorate offered by a nation so powerful as Germany."

Thus will be seen an exhibition of the feeling

and desire, on the part of many Europeans, to secure speedy recognition of this new kingdom, as there is, without doubt, an excellent opportunity to establish commercial relations with a country rich in native products which, if once accomplished, will be not only an impetus to the rapid development of the country itself, but it will be a source of wealth to the pioneers in commerce toward this portion of South America.

## The Mining Bureau.

The State Mining Bureau is doing more field work this year than ever before, and as a result the reports will hereafter be of more value to the mining community. The Legislature, at its last session made it obligatory that this field work should be done. Investigations are being systematically made in several branches. One in particular has long been needed; that is, inquiry into the subject of milling gold ores. There is more inquiry made in this direction than any other, but there is no published data to which people can be referred. All the details of operations and results in milling are being studied and the facts collated. The Bureau will now become better known and appreciated than it has been.

It was only last week that we read in an Idaho paper (the *Coeur d'Alene Record*) the following paragraph under the title of "The Lick Mining Bureau": "A part of the \$5,000,000 donated by James Lick of California for scientific purposes, has been devoted to the establishment of a mining bureau where all kinds of ores are gathered together and placed on exhibition, and they come from all parts of the world. If any mining man should go there he would find it well worth his visit, and an explanation is furnished free by Prof. William Ireland."

From this it appears that everybody does not know that the State Mining Bureau was established and is supported by the State of California. James Lick, who left a great deal of money for several useful purposes, gave nothing to the Mining Bureau. It was not thought of until after his death. The late Joseph Wason was the man who originated the idea, and got the first appropriation for the Bureau through the Legislature. Henry G. Hanks was the first State Mineralogist, and since he resigned Wm. Ireland, Jr. has filled the position.

But ignorance concerning the Bureau and its objects is not confined to distant points, strange to say. One of the daily papers in this city this week announced that James W. Crossman was about to take the field for the Bureau and search for new mining ground, and that he was provided with a complete prospecting outfit. Now, Mr. Crossman was provided with no such thing, and is not going to hunt for new mining ground. The Mining Bureau has nothing to do with prospecting for or developing mines. Mr. Crossman has gone to ascertain for the Bureau the condition of mining in two counties of the State, the number of mines, mills, furnaces, etc., and to obtain information for the State Mineralogist's report. He has nothing to do with looking for new ground or prospecting, neither has anybody else in the Bureau's employ. The only object is to gain information as to the progress of mining industry in California, and as the State pays for the work, nothing is considered outside of our boundaries. Ores and minerals are accepted from other places, when donated, of course; but as far as the Bureau's investigations are concerned, they are confined strictly to California. It reports on what is being done in mines and mills that are being worked by other people, but does no mining or prospecting of any kind.

## Extra Pages.

We publish this week a supplement to the PRESS, making the paper one of 20 pages instead of the usual 16. It is our intention to publish at least four extra pages in the first number of every month hereafter, paying special attention to industrial matters and such things as will be of interest and value to millmen and mechanics. The milling industry on this coast is now one of large proportions, and is steadily growing. All of our manufacturing industries, local and interior, are becoming of more importance from year to year. It is the desire of the publishers of the PRESS to improve it as much as possible, and it is with this object in view that we have increased the number of pages.

## The Sierra Buttes Mine.

It appears from the semi annual report of the Sierra Buttes Gold Mining Company, lately submitted to the shareholders in London, that the ore yielded during the past half-year only \$4.96 per ton in free gold and 83 cents per ton in sulphurets, making a total of \$5.79 per ton, this being \$1.62 per ton less than the yield for corresponding periods during the preceding four years. But this fall-off in the value of the ore was made up in part by a reduction in the cost of mining and milling from \$4.84 per ton previously to \$4.06 last year, when the net profits realized were \$1.73 per ton. There were mined and milled during these last six months 24,908 tons of ore, giving \$144,227.32 gross and \$43,090.84 net returns. Out of the latter \$15,000 were disbursed to the shareholders in dividends, the balance having been applied toward liquidating the indebtedness of the company for their new mill and other improvements.

Toward the end of the year the value of the ore declined to four dollars per ton, and for a time dropped even below the cost of extracting

## A New Ore Concentrator.

Chas. C. Rueger, the well known metallurgist of Anaconda Mountain, has just obtained a patent through the MINING AND SCIENTIFIC PRESS Patent Agency for one of that class of concentrators known as buddles or round tables. The object of the invention is to increase the working capacity of such machines, and at the same time to improve the quality of their performance and simplify the machinery required for such results. These objects are attained by a combination of old and new parts.

The concave round table is constructed in any approved manner, and another convex round table is similarly made. Both of these tables are affixed to one vertical shaft, which is revolved by some suitable driving mechanism at the top. A receiver is supplied for the various products flowing from the upper tables, and which are to be reworked on the lower table. This trough or receiver is stationary and rests on a suitable frame suspended to beams overhead. The products from the lower table pass on to an encircling cone, which presents to them a very much larger surface and therefore

## Coarse and Fine Ore-Crusher.

The PRESS of April was published a description of the Gates ore-crusher which is now being introduced on this coast. It has been in use for some years in the East, crushing macadam and railroad ballast, and has been found very efficient. The accompanying cut represents one of these machines arranged for combined fine and coarse ore crushing with return elevator and screen. The great advantage it has is that it may be set to crush from full size of feed openings down, giving a product varying from about three-eighths inches to sand, if the material is clean and dry, being very valuable in preparing work or ore for stamps, rollers or any other machinery for reducing it to an impalpable powder. It has also a great advantage in the large range of work it will do, from coarse to fine without changing feed or concaves.

When the material to be crushed is clean and dry and discharged freely, the head of the smaller sized crusher can be set up to within three-eighths inch of the concaves, and by means of the lower level on the head all the

## The Great North.

We have been accustomed to speak of the "Great West" of this continent as the only portion promising any special value for undeveloped commercial or agricultural purposes. The northern portion has never received that consideration to which it is justly entitled. Alaska, until quite recently, was considered utterly worthless and a dear purchase by our Government for its cost, \$7,000,000. But gradually its resources are becoming better and better known. Its fur products, its fisheries, its lumber possibilities, and its mines are each a source of immense wealth, and either will well repay the purchase money. More recent reports describe its southern portion as quite an inviting field for agriculture.

Our success in that direction seems to have inspired the English Government with the idea of looking also to the prospective value of their possessions in the interior portions of this region. The interest already manifested in Manitoba is well known. Quite recently a parliamentary committee, which has been appointed to inquire into the resources of the Great Mackenzie basin, have reported that the extent of the region is 1,260,000 square miles; that its coast line on the Arctic ocean and Hudson bay measures 5000 miles, over one-half of it being equally accessible to whaling and sealing craft; that the navigable coast lines of the larger lakes of the region extend for 4000 miles; that river navigation is practicable for 2750 miles; that within the region there is a possible area of 656,000 square miles fit for potato growing, 407,000 suitable for the cultivation of barley and 316,000 for that of wheat; that the pastoral area is equal to 800,000 square miles; that 150,000 square miles are auriferous, and that the evidence submitted to the committee points to the existence in the Athabasca and Mackenzie valleys of the most extensive petroleum field on the American continent, if not in the world.

They report that they have reason to believe that a comparison of the capabilities of this region shows that it exceeds, in the extent of its navigable waters, in the area of arable and pastoral lands, in valuable fresh-water fisheries, in its forests, and in its capacity to support population, the countries of Norway, Sweden, Denmark, Germany, Austria and part of France and Russia. The committee recommend protection for the whale fisheries in the Arctic ocean. The fur-bearing animals of the region are also reported on.

## Electricity as a Motive Power.

We often hear electricity spoken of as a motive power, and the prediction is freely made that it will soon take the place of the steam engine; that it will be employed to propel vessels across the Atlantic and the like. But such a view of the matter is wholly without scientific basis.

Electricity, in its general application to machinery, is never in itself a source of power. It is merely a convenient and easily manageable form of energy, by which mechanical power is transferable from an ordinary prime motor, as a steam engine or a water-wheel, to a secondary motor which is employed to do the work. It performs an office precisely analogous to that of a belt or line of shafting which, however useful in conveying power from one point to another, can, under no conceivable circumstance, be capable of originating it.

When electric motors were first offered to the public a few years ago, but little confidence was placed in them. But since that time they have been much improved in construction, until now the electric motor may be considered as nearly perfected. It has less parts, is less liable to accident, is more easily repaired, runs at more even speed (if so desired) than any other form of prime mover. It develops power with less weight per horse-power than any other. The time is not far distant when small steam, hot air and gas engines will be very generally replaced, at least in cities and large towns by electric motors.

Until some plan can be devised to obtain electricity direct from the burning of coal or oil, the steam engine will continue to be "the great prime motor." This is not saying that electric motors will not come more and more generally into use, but the steam engine will lose nothing of its prestige, and steam-engine

THE GATES COMBINED COARSE AND FINE ORE CRUSHER.

and working it; yet operations were continued, the perseverance of Superintendent Preston having finally been rewarded by the opening up of a new and better chute of ore. This new find, which occurred on the ninth level, pays at the rate of six dollars per ton, and promises to prove permanent. That it will do so is much to be hoped, as even the temporary suspension of operations in a great mine like this, would prove a serious misfortune, not only to the company and their employees, but also to the business community where the property is situated.

In order to avoid shutting down, the general manager, Wm. Johns, was forced to take some chances as well as practice extreme economy, as even in such emergency no aid could be expected from the directors in London, and of this he was well advised. Yet his business sense and long experience as a miner, indicated the proper course to be pursued. That it has led to such fortunate results is matter for general congratulation; nor is it probable the company will ever again be reduced to like straits.

In so resolving to drive ahead during this season of borasco, Manager Johns has set an example that other mining companies would, under similar circumstances, do well to follow.

The Chollar folks are running about 200 feet of blanket sluice and saving some of the tailings. They will doubtless build others in the near future.

greatly decreases the force of the currents so that ore particles which have been swept from the two tables will deposit and can be treated under conditions which favor their separation from barren matter.

This outside curve, therefore, does the finishing or tailings work in a direct and simple manner without the intervention of more or less complicated mechanism, because the buddles or tables perform the office of feeders, distributors, deadheads, etc.

As the cone remains stationary, the point or section of discharge for any assumed product travels around the periphery. For this reason one of the arms of the lower table is extended beyond the periphery of the cone and carries at the end a trough, the purpose of which is to bridge the circular sluice so that the concentrated product from the cone can be delivered into the tank. The barren tailings drop into a sluice and are carried away.

THE Columbia School of Mines faculty are about to appoint an examiner in Salt Lake of applicants for admission to the school, so that candidates can ascertain without going to New York whether or no they are qualified to enter.

TROUBLE with the miners at Newcastle, W.T., resulted in the indefinite shutting down of the mines by the order of Superintendent Miln, of the Oregon Improvement Company.

coarser pieces are crushed several times before they can get out, thus allowing nothing larger than three-eighths inch to pass through. When the return elevator and a screen are used, a great deal finer product can be obtained, according to the nature of the screen used. The Pacific Iron Works of this city has the agency.

A PATENT FURNACE CASE.—Daniel Meyer, M. G. Rhodes and the Aetna Quicksilver Mining Company have for a long time been using a patent furnace invented and owned by R. F. Knox and Joseph Osborne. The inventors brought suit against Meyer et al. in the United States Circuit Court, and Judge Sawyer has decided in favor of Knox and Osborne, and Master in Chancery Houghton will assess the amount of damages due the inventors. The defendants are restrained from making any further use of the furnace.

COMPLETE returns of the bullion product of the Hale & Norcross mine during the month of April have just been received. The delay in securing these returns is owing to the shipment of the bullion to the Carson mint, where it is parted and the gold portion is sent back to the mine to pay expenses while the silver is sent to this city to be sold. There is an important saving in exchange by this means. The total product of the Hale & Norcross mine in April was \$133,467.76, of which \$64,038.86 was gold and \$69,428.90 was silver.

builders may confidently console themselves with the fact that their calling will never retrograde in importance until electricity direct from coal has assumed a practical form.

#### New Uses for the Wire Cable.

A wire cable, for the propulsion of cars for short distances, with the cable above ground, has been in use, to a limited extent, for many years, both in this country and in Europe. It has been used in Scotland for over 20 years to haul ore from mines. But it is only since the improved use of the wire underground, first applied to street traffic in this city, has become generally known, that any very general attention has been called to the value of such a mode of propulsion.

The wire cable both above and underground is now coming into very general use in Europe for short-distance hauling. It is said that one of the chief reasons why the Spanish iron ore can be shipped so cheaply to this country lies in the fact that by the use of lines of this system from their large open cut mines to the wharves where the steamers lie, practically no handling of the ores takes place, and consequently the cost of transportation is reduced to a minimum. The figures from the manager of one of the tramways operating in the Saarbrücken coal district, Germany, show that the cost of transportation is only 54-100 cent per ton per mile. The length of this line is about four miles, and it is carrying 1000 tons of coal per day.

It is said that a single firm in Germany, Bleichert & Co., have already erected 350 lines of their system alone, while a large number of additional lines have been put up by other builders.

Some idea of the extent to which these roads are being built can be obtained from the German Government mining statistics, which show that for each of the last three years the amount of wire cable used for the construction of cable roads alone was one-third more by weight than the whole amount of wire rope consumed in every other department of mining throughout the country.

Its application of the underground cable as a means of transporting freight between interior districts and the cities will probably ensue. In nearly all the countries of Europe special laws have been promulgated, regulating not only the construction, but also the running of these cable roads. In fact, they have become one of the regularly acknowledged means of communication in all sections of the country, whether either natural difficulties presented by the contour of the ground to be traversed would render the construction of surface roads either too costly or altogether impracticable; or where, on the other hand, the service required is less than enough to keep the rolling stock and personnel of a surface railroad fully employed.

If such results can be obtained in Germany, ought not our engineers be able to make a more general application of either underground or surface cables in this country? The problem of cheap transportation over short distances of, say from 3 to 8 or 10 miles, is one which, once solved, will enable hundreds of mines, quarries or factories to be successfully operated, which, without such facilities, would be practically unprofitable or never be brought into existence.

A DISPATCH from Nogales, Arizona, says: Quite a flurry has been created in mining circles by a rich silver discovery in the foothills of the Pajarito mountains, 10 miles west of Nogales. Experts who have visited the locality say that it is one of the richest silver discoveries ever made in Arizona. The ore assays from \$400 to \$5000 to the ton. Great quantities of malleable ore have been picked out of the ledge. Several shafts have already been started and a large area of ground has been located. An abundance of water is found in the immediate vicinity.

SOME 4000 feet of 10 and 8-inch high-pressure water pipe from the combination hydraulic pumps will be placed in the Chollar shaft, on the Comstock, and will be used to drive Pelton wheels at the bottom of the shaft to run dynamos, from which the energy will be transmitted to the Nevada mill and to the surface for local use. They are in sections eight feet in length, and weigh about 1200 and 1500 pounds each, the whole aggregating nearly 400 tons. It takes over 500 sections to reach the bottom of the shaft. There will be two columns set, one of each size.

#### Progress of Oil and Gas Fuel.

Oil and gas is steadily making its way into general use in this country. Especially is this the case in our great iron works. The quite recent past has witnessed some important successes in this direction. Notably we refer to the Union Steel Works in Chicago, which institution has fitted up its entire plant of boilers and furnaces for the purpose of burning oil. These works now consume 1200 barrels of oil a day. The Cleveland Rolling-Mill Company is now using from eight to ten carloads of oil a day, and the famous De Pauw's American Plate Glass Works at New Albany, Ind.; the Studebaker Bros. Manufacturing Co. at South Bend, Ind., the great Thread and Flaming Mills of Flint, Mich., and many other lesser establishments have done the same thing.

Eastern manufacturers have not been slow to recognize the merits of oil fuel, and among those who have gone to using it are the Worcester Steel Company and the Wabash-Moen Manufacturing Co. of Worcester, Mass., and Allen Bros., manufacturers of wall paper, at Sandy Hill, N. Y., and now comes the information that negotiations are pending for the introduction of fuel oil into several manufacturing concerns in Philadelphia.

While this is being done by our Eastern manufacturers, the city Government of San Francisco is engaged in throwing hindrances in the way of similar improvements in this city on the score of unfavorable action of the oil on boilers and consequent danger, and all this in the face of high authority to the contrary. With coal at from \$12 to \$18 per ton, our manufacturers are virtually compelled to ignore or disguise a fuel which would be equivalent to coal at from \$4 to \$6.

#### Natural Gas Fuel.

While we are being thus cut off from the use of oil there is hope of ultimate relief from the use of natural gas which is being struck in various localities throughout the State. Should it be found in large quantities, such localities might become important centers of industry at the expense of this city. There are prospects that a good supply of natural gas may soon be developed in the Buttes, a few miles back of Sutter City, Sutter county. An old shaft was sunk to a depth of 40 feet a dozen or more years ago, by parties prospecting for coal and other minerals. They struck a strong flow of gas, and it was abandoned in consequence after an explosion had occurred which wrecked the windlass at the top of the shaft. Ever since the shaft has been giving out gas.

Gas is also found at numerous other places in the State, near Stockton, near Merced and in various places in the Southern portion of the State. There is good reason to believe that it may also be found in Alameda county and near this city. We understand that measures are in contemplation for a more thorough exploration for gas in several localities where it has been found in small quantities. Such explorations are greatly needed in view of the benefit to our industries that might be derived from success in that direction.

The use of natural gas in Pittsburg has proven of vast benefit to that city. It is not only enabling the iron manufacturers to turn out their goods at a less cost, but also of better quality. As an evidence of this we may remark that the *London Iron Monger* some time ago in referring to the introduction of some Pittsburg tools into the European market, appeared quite skeptical in regard to the success of the American manufacturers, but in its issue of March last it announces that Bagshaw Brothers of London, Paris and Brussels are acting as agents for Park Brothers of Pittsburg, and that the arrival of shipments of steel made by natural gas is now a confirmed fact. It is added that, "if it be true that the process of making steel by means of natural gas gives purity of flame and unexampled regularity of heat which no other kind of fuel can supply, this is perhaps a rather serious handicap for the British producer."

NEWSPAPERS IN 1888.—The last edition of Geo. P. Rowell & Co.'s "American Directory" fixes the number of newspapers and periodicals now published in the United States at a fraction over 16,000—a gain of \$90 during last year. In 1836, when the writer first entered the editorial field, the number of periodicals then published in the country did not exceed 900.

## SHOP NOTES.

#### Milling vs. Planing Machines.

There is quite a sharp controversy in progress in the columns of the *American Machinist* in regard to the relative merits of milling and planing machines. The *Machinist*, in alluding to the controversy, says:

There is a field for the milling machine, and there is also a field for the planer, each being better adapted to the work in its particular field than the other.

The comparative efficiency of milling machines and planers depends not only upon the character of the work, but upon how much of it is to be done, the limit of variation allowable, and last, but by no means least, upon the man who is to manage them.

Because a planer may be more efficient than a milling machine in a given shop, under certain conditions, and with certain management, is no positive proof that it will be so in every shop or under other conditions or management, any more than because (as one of our correspondents says) a feed of 1/64" is fine enough for cutting key-ways, 1 1/2" wide, on a 45" Sellers planer, therefore it is fine enough for any work on any size planer.

In some few machine shops it would probably pay to use milling machines entirely in place of planers, and there are other shops in which it would not pay to use them at all, but in the vast majority of shops, under intelligent management, it will pay to use both, each for its own appropriate work. This is not a mere theory, but is proven by actual shop experience. It is undoubtedly true, however, that the field which can profitably be covered by the milling machine is much more varied and extensive than has been generally believed, especially by those mechanics who have had only a very limited experience with them.

As tending to show the weight which the character of the work to be done must have in the choice of methods, we may mention a case coming under our observation. There were a lot of cold-rolled shafts about two feet long and two inches in diameter, which were to have a half-round groove cut in them from end to end, the groove being about 3/16 inch wide and half as deep. Now, if these grooves had been required to be very accurate as to dimensions and form, and to be left smooth and in good shape, it would have been a good job after the milling machine man's own heart; but this groove was only for an oil way, and the job was being done on a planer. The man had a sort of fork bolted in the middle of the planer bed over the T-slot, into which the ends of the shafts were pushed after being laid in the slot, and they were not fastened down in any way. The shaft passed under the tool once and the groove was finished, and while it was doing this, the man picked up another shaft and laid it on the planer bed beside the first one; during the back stroke, the shaft, which had just been grooved, was rolled out of the slot, and the other one rolled in, and at every stroke of the planer a shaft was grooved, the planer not being stopped at all. The rate was about five shafts per minute, and the temptation to rig up a milling machine for the job was quite small, even for the most enthusiastic milling machine man. Of course, the man who was running that planer was not a mechanic, and could not have done a fine job of planer work at all, but he was doing that particular job well enough for the purpose, and incidentally was demonstrating that for some work the planer was superior to the milling machine; but the same shop made use of many milling machines, and had that groove been of a different character it would have been milled, and milled better and faster than it could possibly have been planed.

Many such cases might be mentioned, going to show that the choice of a machine to do a certain job must be governed by the character of the job, and the decision should be made by a mechanic thoroughly familiar with both machines, and without prejudice for or against either of them.

REDUCING STEEL TUBES, ETC.—The editor of the *American Mechanic* recently paid a visit to the works of Billings & Spencer, of Hartford, Conn., where he witnessed a number of novelties in the way of "shop notes." He says: "We were shown some specimens of steel tubing, parts of which had been reduced in diameter under dies, the effect of the operation being somewhat remarkable. There seemed to be little or no tendency to lengthen the tube, when its diameter is reduced in this manner, but the surplus stock is taken up by the thickening of the reduced portion. One specimen was a piece of steel tube about three inches diameter, and six inches long, about four inches of which had been drawn down to about an inch in diameter, leaving a portion at each end the original size. Good shoulders were formed, not being over three degrees from square. We saw also a 'box' for a vehicle wheel, which had been made of a piece of welded steel tube reduced to the proper taper under dies, and flanged."

SAVING POWER.—When a shaft is to be loaded down with pulleys and strung up in every direction with belting, quite a saving in power can be made by giving some attention to the number of bearings that can be brought into use. A light shaft, with bearings close together, will

stand as much lateral displacing tendency as a heavy one with hangers few and far between. There is nothing lost by having a few extra bearings, as far as friction goes, if the foundation has got through settling and the frame from warping out of line, but the percentage in power keeps up wonderfully with the size of the shaft when an addition in this respect is made.

#### How to Sharpen a Plane Iron.

The simple art of sharpening a plane iron is supposed to be understood by every mechanic, remarks a writer in a contemporary, but there are hundreds of men who cannot do a creditable job in this respect. The common tendency is to round off the edge of the tool until it gets so stunted that under a part of the cutting the tool strikes the work back of the cutting edge. To do the job correctly, we will begin at the beginning and grind the tool properly. First, the kind of wood to be cut must be taken into consideration. Common white pine can best be worked with a very thin tool, ground down even to an angle of 30°, provided the make of the tool will allow it. Some planes will not, for the iron stands so "stunt," or nearly perpendicular, that its grinding causes a severe scraping action, which soon wears away the tool. In such cases from 45° to 60° is the proper angle for plane irons, and this, too, is about right for hard wood planing.

Determine the angle you want on the plane iron, and then grind to that angle, taking care to grind one flat bevel, and not work up a dozen facets. If the stone be small, say 12 inches to 18 inches in diameter, the bevel will be slightly concave like the side of a razor, and this is a quality highly prized by many good workmen. In grinding, take care to avoid a "feather edge." If the tool already possesses the right shape, grind carefully right up to this edge but not grinding it entirely off. The time to stop grinding a tool is just before the old bevel is all ground off.

Should the tool need any change of shape, such as the grinding out of a nick or a broken place, then put the edge of the tool against the stone, and bring the tool to the desired shape before touching the bevel.

Let the iron lay perfectly flat upon the stone, with a tendency only to bear harder upon the edge of the bevel than upon the heel. Move the iron back and forth on the stone as fast as your skill will allow, taking care that the heel of the bevel is not lifted from the stone. As you become proficient in whetting an iron, the heel may be lifted from the stone about the thickness of a sheet of paper, or just enough to prevent it from touching. The reason why many carpenters cannot set an edge is because they raise their hand too much, and perhaps rock the tool, thus forming a rounding bevel, the sure mark of a poor edge-setter.

The proper way to oil-stone a tool is to continue the grinding by rubbing on the oil-stone until the bevel level left by the grindstone is entirely moved, and the edge keen and sharp. If this be properly done, the tool need not be touched upon its face to the stone, but among a dozen good edge-setters not more than one can do it. It is a delicate operation, and can only be acquired by long practice. Nine times out of ten the average workman is obliged to turn the plane iron over and wet the face thereof, and here is where many men fail who have done the other things well. By raising the back of the tool only a very little the edge is "dubbed off," and regrinding of the face becomes an immediate necessity. A good stone should "set" an edge on a tool which will shave off the hair on a person's wrist, without cutting the skin or missing a single hair.

FORTY-THREE varieties of sewing machine shuttles have been made here; four of them for sewing-machine builders in England, who freely admit their superiority over anything in that line obtainable in England. The machinery and tools for making these shuttles and the bobbins are quite interesting to the mechanic, the latter being made entirely by automatic machinery. A good deal of the work is polished here, and as a protection from rust had been given a very light coating of vaseline. This is a new substance for that purpose and serves admirably, a light coating of it being colorless and scarcely perceptible, yet being an effectual and complete protection. After trying nearly everything else, they consider it the best, a fact which many of our readers will be glad to know. The smallest forging they are at present making is used on a type-writer and weighs one-sixteenth of an ounce. In the store-room, where the finished stock is kept, is an exhibit which, on account of its great variety and the elegance and finish of the articles, is quite interesting to the mechanic, especially when we consider that, notwithstanding the antiquity of the art of forging, this is all the product of an art which has been acquired within a comparatively few years, and has reached its highest development in this country.

COPPER CASTINGS.—The making of drop forging for electrical work out of pure copper has grown into an extensive business, and about five tons of copper per month are now used up at these works in making commutator bars and segments. Unalloyed copper is best for this purpose, but it had not been available because the bars were of such shape that it was considered necessary to cast at least a part of them, afterward brazing the parts together to form the complete bar. Since pure copper cannot be

cast, they are made of an alloy containing as much copper as would admit of its being cast. Mr. Billings happening into a shop where they were making commutator bars in this way, offered him a piece of a solid piece of pure copper—a proposition which nearly took the breath away from the Swedish electrician who was doing the work, but which, notwithstanding his skepticism, led to the present business of drop forging them, and the entire abandonment of the old method.

**KEEPING THE RUN OF THE STRENGTH OF BOLTS.**—As a general thing it takes as much, if not more, says a cotemporary, to shear a bolt off as it does to break one apart by using a direct pull, for all the shearing is supposed to take place in the body of the bolt where the cross-section is the largest, instead of taking advantage of the weaker portion just under the nut, down at the roots of the thread. The area here is more than a fourth less in cross-section, and stands a good chance to get an uneven strain by the load not resting fairly under the head. One of the best conveniences for keeping the run of the comparative strength of bolts is to become acquainted with a number of sizes to the amount of work they are able to stand, and from this gauge all others accordingly. A one-quarter inch bolt is good for 250 pounds, which it ought to be able to stand if it has any show at all. With one twice as large, all rules would make it out to sustain a load of one-half a ton, or four times the amount of the one-half inch size, when five times this strain would be safely provided for. A seven-sixteenth bolt or one-sixteenth less in diameter is amply large for a one-half ton strain. With these figures a workman should be able at a moment's thought to cut out an eye-bolt that has some reference to the work at hand, if it is nothing more than to hoist a load into the second floor of an establishment.

**POWER IN THE SMALL SHOP.**—All mechanics should be interested in such matters as power and machinery in shops for ordinary job work. There is always economy in substituting power for hand work wherever it can be done. Even in the very small shop power is more than an equivalent for an extra hand. A shop where any large amount of work is done should have, if possible, a circular saw, a band saw, a Daniels, a side-wheel planer, a rounding and a polishing machine, a turning lathe, and a mortising machine. They are all inexpensive. They economize labor and improve the quality of work. The cost of running them is but a trifle, if you are where power can be had. Moreover, by having such machinery, business is increased by being able to secure jobs that cannot be obtained where there is nothing but hand work. In these days of sharp competition men with small shops need all the help that machinery can give them.

## OUR LUMBER INTERESTS.

### High-Priced Lumber.

The present high price of lumber is set forth by the people of the Southern part of the State as a great hindrance to the growth of towns in the Southern counties. The San Diego Sun, of May 18th, says: "Although the property-owners and contractors and builders are not in open warfare with the different lumber companies in this city, yet such seems imminent, as the complaint against the lumbermen is loud and bitter. It seems that the cause of the trouble is due to the action of the lumber companies in maintaining the exorbitant prices that prevailed eight months ago when material was scarce and the demand enormous. From careful inquiries made yesterday it was learned that the number of property-owners who are delaying building because of the exorbitant prices asked for lumber can be reckoned by the score, hence the result is evident that the setback San Diego is receiving in the building line is only due to the greediness of the pooled lumber interests."

The Sun gives the names of quite a number of parties in San Bernardino who are anxious to build; but who will not do so at the present price of lumber. The high prices which have been so long maintained is evidently holding out inducements for the opening up of new fields of lumber supply, which must come in sharp competition with our present sources of supply.

It has been stated as a fact that a heavy syndicate of Texas lumber men have made arrangements with the Southern Pacific Railroad whereby they can put lumber in our yards at 35 per cent less than present prices. The lumber is the celebrated yellow pine of Texas and Louisiana.

A cotemporary doubts the practicability of the scheme. It can be done, however, if the railroad will make rates low enough. But will they? If they will, it will stimulate building and be the cause of again starting a building

boom which has been greatly retarded, both by high prices and also by the practical impossibility of getting lumber at all.

It is also stated that a syndicate of California capitalists has been formed to take up 400,000 acres of land in New Mexico, much of which is covered with pine timber, build sawmills, and construct a branch railroad 30 miles long to connect the mills with the Southern Pacific road. If the timber on this tract is of good quality and easily accessible, this will probably be the readiest way of providing lumber for the southern portion of the State. The activity in the building interest which is now setting in in the central and northern portions of California, will soon absorb all the lumber which can be produced on Puget sound and other portions of our northern coast, and in the Sierras as well. There is already an urgent need for the opening up of new lumber regions to supply the rapidly growing demands for that indispensable requisite for the rapidly growing population of this coast.

### Redwood Stumps and Roots.

Redwood is now being largely used in the manufacture of furniture. For certain pieces of furniture redwood could not be surpassed in beauty by any other wood, provided a man understands the finishing of the same to perfection.

It should be finished so as to retain its natural color. Experts who have been working for many years in redwood say, that in the finishing, to have it done well and quick, also to have it retain its natural color, a somewhat different manipulation is required than by finishing other woods intended for fine work. To use fillers, such as corn-starch, whitening, etc., is unnecessary, for redwood has no pores to be filled.

An expert writing to the *Architect* of this city, says: "I have a compound and a way of doing the work to perfection, different from any other process now in use. By my finish redwood is as smooth as glass, the figures of the wood are brought out distinct, whether to be finished in bright natural color or in imitation of rosewood, walnut, mahogany or other kinds. I use mostly such redwood as is rejected by carpenters, or has hitherto been used very little. I use the stumps and roots, which have always been a nuisance to farmers, and which they (the farmers) are glad to get rid of; such stumps, after the timber is cut, are in general left standing, with the expectation that they will rot in course of time, but none have found out yet how long that will take, for I have recently used the wood from stumps of which the trees had been cut down 22 years. The stumps were partly burned, and after digging them out I found the inside portion fresh, green and solid. The wood, after being cut in proper shape, now is most beautiful. The diameter of such stumps is often enormous. By proper means and manipulation such stumps can be made to bring more money than the price of the land and the value of timber that has been cut from them. There are fortunes to be made in this point, more reliable than a gold mine."

This expert works up slabs and stumps into fine furniture, panel-work, picture frames, etc., and finishes them in any shade or color which may be desired. The stumps however, make the finest work.

### The Evils of Tariff Tinkering.

The protest against the removal of the duty on lumber which the lumber firms of the Pacific Coast have sent to our representatives in Congress serves at once to show how intimately one branch of business is allied to another under our protective system, and the injustice of picking out one particular branch to experiment upon. The lumber firms say that if the duty is taken off of lumber they will demand that restrictions which make the cost of producing lumber greater in the United States, than in Canada, be removed. The duty on iron, sugar, cordage, and other things, that tends to increase the cost of manufacturing lumber, should, they claim, in justice to the lumber interest, be repealed. It is not easy to see how this demand is to be answered. Why create an artificial price for the things the lumbermen consume, and place their product in the market at the natural price in the place of cheapest production? Canada has inexhaustible stores of this raw material. It imports coolie labor to convert this raw material into lumber, and subsidizes railroads which transport it to the American market at a nominal charge. We now equalize the cost of production in the two countries by placing a tax on foreign lumber, but the free-traders declare that the duty must be taken off. The matter of labor alone requires that the American lumber business be protected. We refuse to allow American lumber firms to import Chinese labor, but our authority, of course does not extend to Canadian competition. The latter may import Chinese under contract at \$50 a head, and use their labor to flood the American market with lumber. In this way we receive the product of Chinese labor while excluding the laborer himself. The lumber interest is a good one to make a stand upon. If it is the American policy to exclude coolie labor it should also be the American pol-

icy to so tax the product of coolie labor in other countries that it will not come in direct competition with American labor.—*Exchange*.

**ENORMOUS GROWTH OF THE LUMBER BUSINESS.**—Reliable statistics assure us that in 1860 the entire lumber product of Wisconsin, Michigan and Minnesota was 1,600,000,000 feet; in 1887 it was 7,500,000,000 feet, or nearly five times as much. The result of this enormous increase of production has been to advance pine lands in those States from \$1.25 per acre, and in some instances to \$75 an acre, which means an average value of \$4 per 1000 feet of lumber in the trees. That is the condition of things today in those three States. Meanwhile the consumption has gradually reduced the stock of uncut pine until it is now estimated at from 100,000,000,000 to 140,000,000,000 feet, the latter figure being the outside limit, or a supply for 20 years at the present rate of consumption. The steady consumption renders it certain that a new field must be sought by those wishing to invest capital in pine timber. Attention is therefore turned to the pine lands of the South. Although of a different quality, the pine of the South can be used for every purpose for which the white pine of the North is used to-day, and it is equally as convenient to market. In fact, it is the only pine available for the future except that on the Pacific Slope. Reliable estimates place the amount of pine timber in the South, from Florida to Texas, at 240,000,000,000 feet. This amount, with its natural growth before it will become exhausted, will probably reach 400,000,000,000 feet. The timber resources of the South should be an immense source of wealth to that region; but, unfortunately, the people of the South are allowing the lumbermen of the Northwest to gobble it up from them at the mere pittance for which such lands are now selling. Hundreds, and probably thousands, of square miles of this timber region has already passed into the hands of Northern capitalists.

**HUMBOLDT TIMBER LANDS NOT TO BE SURVEYED.**—A large number of Humboldt county residents petitioned the General Land Office at Washington some months ago to have surveys made of lands in that county containing redwood timber, to give them an opportunity to file on the land and ultimately purchase it. A few days since Surveyor-General Hammond received a letter from Commissioner Stocklager on the subject, stating that the surveys could not be made, that the existing regulations prohibit the survey of forests, and that expenditures must be restricted to the survey of agricultural lands. He concluded his communication by stating that the granting of the petition would nullify existing surveying instructions and establish a bad precedent.

The managers of the Hesperia colony, San Bernardino county, have contracted for 1,000,000 feet of lumber for building purposes. They intend to spend \$500,000 in bringing water to their 30,000 acre tract.

**SHINGLES FOR CHICAGO** is the latest business wrinkle in the business of Puget Sound; 120,000 fancy shingles recently went forward in one order.

**WORKMEN** are putting in on an average 15 sections of water-pipe daily in the Chollar incline for the electric system of transmission of power. There are about 500 sections to put down to complete the job. As the surface of the shaft is neared, quicker work will be done. All the clamps and bolts are about manufactured, and the carpenter shop is turning out the framed timbers as fast as they can be handled. The blacksmith force has been worked far into each night to turn out necessary material, but they can now take a breathing spell, as they are ahead of the work. The order has been to work every department to its fullest capacity, and it has been strictly obeyed. The Chollar shaft is now the busiest hive on the Comstock lode. The electric plant is expected in a few days, and everything in the shaft will be completed at about one and the same time. At the mill there is a strong force at work, framing the timbers for the additional battery of 20 stamps. It is worth one's time to see the massive timbers used. Only one timber can be cut from the largest trees—what is known as the butt log.

The electric machinery for the Big Bend Tunnel Company, Butte county, comprises two dynamos, 12 motors, 50,000 pounds of copper wire and a large lot of different kinds of machinery. The dynamos have a capacity of 140-horse power, and the motors five-horse power each. There are two lines of copper wire, one seven miles and the other ten, and as each is double this makes about 34 miles of wire. The electric power will be used to run the pumps and derricks. The plant was furnished by the Sprague Electric Railway and Motor Co. of New York. A force of men is now engaged in getting everything ready for the immense plant. Three hundred inches of water with a fall of 300 feet to the Pelton water-wheels will furnish the necessary power to run the dynamos.

**NOTWITHSTANDING** the alleged scarcity of water, the Boca Mill Company near Truckee, has completed the most successful log drive that has been made by them for many years. The pond is estimated to contain nearly six million feet of saw timber.

## COTTON AND WOOL.

### Asiatic Cotton Competition.

Much interest is being manifested relative to the possibility that cotton culture in the United States may soon meet with unwelcome competition in the production of this important staple in northwestern Asia. Quite extensive experiments in cotton culture have been made, under British encouragements, in Egypt and Central Asia; but the latest and perhaps most successful efforts have more recently been attempted under the patronage of the Russian Government in Turkestan—the Russian Asiatic province on the northeastern shore of the Caspian Sea.

In regard to these experiments, an Eastern cotemporary says: "Russia is aspiring to be numbered among the cotton-growing countries of the world, and has already in the neighborhood of the Caucasus range produced a sufficient quantity of the staple to attract attention from those cognizant of what is going on in a locality not likely to be generally associated with the growth of the fibrous plant. The enterprise has been in the hands of large moneyed concerns, freely supported by government assistance, and pushed with a quiet but determined energy that at last appears likely to attain the desired success." Our consuls have noted the same thing, and many optimistic views have been expressed concerning the future of these efforts.

But what is here said regarding Caucasus, is said more emphatically about Turkestan, where the chief hopes of the Russian Government are now centered. This territory is now being opened up and brought into direct commercial relations by rail with the general system of Russian railways. It is the point in Russian Asia to which the attention of the world is just now being attracted, in connection with great military preparation and railroad activity. The southern portion of this province is in the same latitude with North Carolina; but the difference in the climate of the two sections would place it, relatively, within the latitude of our best cotton-producing States. Just south of the Russian line is found the magnificent valley in which Herat is situated, and which but a short time since was so actively threatened with Russian troops as to call forth active military demonstration by England. With this valley in her possession, Russia would occupy a most important vantage ground.

The *Boston Journal of Commerce* says: "The development of Central Asia, or such parts as lie within the valleys of its great rivers, into an agricultural district, is a momentous undertaking requiring more than the skill of the engineer to bring to a fruitful issue. The people of the country, that are native to the soil, must be either supplanted by a more progressive race, of a higher civilization, or brought up to a level of equal intelligence and enterprise. More than all of this, it has not yet been satisfactorily demonstrated that the climatic and other natural conditions of Turkestan are as suitable to those in the United States for the highest results in cotton culture. We have serious doubts if these conditions do exist to an equal extent. Certain it is that very extensive schemes of irrigation will have to be inaugurated and become familiar adjuncts in cotton culture, before any great results can be accomplished. None of these artificial methods for improving the productiveness of the land are called for in this country, and the expense attending them is saved. There is the climate, which must stand unchanged regardless of human efforts, and in it are to be found the chief elements for final success. Has Turkestan got it, in the same perfection as characterizes the climate of our own Southern States? There are those who are willing to testify that it has, but India has had for many years equally enthusiastic advocates, yet trials and experiments have never fulfilled expectations, even in the Dharwar district, which has always been regarded as the garden spot of India for the best results in cotton culture."

Every effort that has been attempted on Asiatic soil has failed in attaining the perfection so dominant in American cotton. American seeds have been planted and cultivated, time and again, with the greatest care and under the best attainable conditions, in India and Turkestan, and invariably have the results scoffed at the efforts. The first year would show a deterioration in the quality of the production, and a few seasons would efface nearly all the original characteristics of the seeds. Correspondents speak of the Asiatic grade equaling our middling and good middling. This may be all true, but it is apt to be misleading, as the grade is more the result of careful cleaning on ginning than anything affecting the quality of staple. We have seen many samples of Americanized Asiatic cotton, of the

first year's and and after year's growth, and it required no experienced eye to discern the decadence in spinning qualities."

Some of our Southern cotemporaries are evidently much alarmed at the situation. The *Atlanta Constitution* informs its readers that they "may well prepare to meet very formidable competition in India, in Asia, and in Africa." Further than this, it says: "There is another source of competition that the South will have reason to fear before very long. This competition will come from the Central Asian provinces of Russia. The cotton raised in Turkestan is practically American cotton. It is raised from American seed, and is said to have a fibre equal to the cotton that is grown in the South. The fact was noted only a few weeks ago that a Russian agent was going through the South buying the finest varieties of cotton seed, and this, together with the fact that Turkestan is already raising as marketable an article of cotton as can be grown in the South."

A limited amount of cotton is already raised in Turkestan, according to the rude methods in vogue among the natives. It is said, on most excellent English authority, that the cultivation of cotton in this Russian province is rapidly extending, reaching, in 1886, 32,000 acres. But even under the most favorable circumstances, Turkestan will require years of patient toil and European enterprise before it can assume to be on the high road of success in the cultivation of cotton. It is a question if Russia will be able to accomplish its purpose of inspiring new vigor in the dull make-up of the native population. By the time Turkestan has all her arable land devoted to cotton, should that time ever come, there will be a legitimate demand for her product, in addition to any probable gain in the American production. In the course of a few years the demand will require new fields for cotton culture.

### Revival of a Home Industry.

Some 50 years ago, most of the farm-houses New England were manufacturing centers; most of the woolen goods for every-day wear being made in the home. Cover-lids and blankets were also made from the wool of the sheep raised on the farm. The wool was carded, spun, woven and dyed, producing fabrics often of quite fine texture and always of very superior wearing capacity. Until recently, the writer was in possession of a blanket, which had been handed down from his grandfather, by whose hands it was woven, and which had stood almost constant wear for fully 50 years. No blanket could be bought to-day, for any price, which would stand the wear that the one in question endured.

To-day, people who are fortunate enough to possess one of these cover-lids of especially fine texture and colors, and of good pattern, are using them for ornamental draperies for the window or for portieres.

An effort is now being made in some parts of the Eastern States to revive this industry, in order to give to woman and children work at home, and, to use the expression of a cotemporary, to produce for the women of the North what the women of the South have already secured—a textile which shall reflect the color and design peculiar to the locality, for this local color is an especial charm when developed by skillful workers, as has recently been done. Goods of this character are already beginning to appear in small quantities; and with the help of art design it is hoped that before long we shall be able to meet the demand for New England textiles which has been made since the goods were first shown. Some of the later textiles, those woven 30 years ago, show more brilliant color and lighter weight. A very fine pattern is of flowers thrown into relief upon a deep brown background. The possibilities which lie in this New England textile seem to promise a revival of art industry for the Eastern States.

THE OREGON WOOL CROP promises a good yield—this with fine quality. Late advices to the *Call* of this city say that sheep-shearing is actively progressing in Eastern Oregon, and wool is already being hauled to points on the railroad. The clip being hauled to Arlington and the The Dalles is in fair condition. The staple is better than last year, except from localities where the ranges are crowded. Umatilla and Snake river wools are average in appearance. Union and Baker counties show a heavier clip, owing to the introduction of better blood. Grant county wools are light, and, on

the whole, the clip of Oregon may be considered five per cent heavier in shrinkage than last year, but wools classed as railroad wools by the trade are as much as 10 per cent heavier. There is no buying to speak of, except at Arlington, where Eastern speculators are operating to a small extent at full prices. There seems to be a tendency among wool-growers to accept current prices, but buyers are not at hand. The leading grading-houses of the city have orders to the extent of several million pounds to be filled, but not till something more definite is learned in regard to the Mill's Tariff Bill.

**FASHIONED GOODS.**—Fully one-third of the "articles worn by men, women and children," to follow the language of the tariff statistics, are now made by the use of fashioning and finishing machinery—mostly some kinds of knitting machinery; and in the forms actually worn, as distinguished from cloth made in the "piece," it cannot be doubted that this is a great economy, and that the most material saving of labor is effected by this change. An increasing proportion of articles, like the cardigan jacket for men, and the popular jerseys for women, is constantly called for. They were never so acceptable to the popular use as they are now, because they are fit for immediate use, and cost no more than the materials of which the like garments in cloth would cost, saving delay, and also the cost of the making, increased in the use of cloth garments. The knit goods industry represents a double progress, therefore, and it is a subject of interest with those who seek the attainment of social economics, as well as with the proprietors and persons employed, who have found it a safe and attractive department of business.

## Flour Mill Notes.

### Wheat Production and Export.

It is a necessity with free-trade advocates to show that the American wheat-grower depends upon the foreign market for the sale of his wheat. While it is true that we still send some wheat to Europe, it is also true that low prices in Liverpool and increasing demand at home are making the foreign market each year of less consequence to us. Within the last eight years the production of wheat has fallen off, and the proportion of that exported to the entire product has fallen off more rapidly. The following table shows the production and the exports for each of the last eight years:

	Production. Bushels.	Exports. Bushels.
1880.....	403,549,863	144,483,207
1881.....	383,080,050	120,451,388
1882.....	502,798,600	110,343,185
1883.....	421,189,100	70,143,289
1884.....	512,763,000	21,523,473
1885.....	357,112,000	53,628,000
1886.....	457,218,000	89,204,387
1887.....	476,229,000	95,128,641

It will be seen by this table that instead of increasing the production to meet the home demand from growth of population the increase in consumption is taken from exports.

It will be seen from the above table that the production of wheat decreases, actually as well as relatively. The product for 1887 was 50,000,000 less than for 1880, and the prospect for 1888 is that the product will fall short of that of 1887.

The report of the Commissioner of Agriculture for 1886 says that there is an increase in the wheat area of Europe, India, South America and Australia, and that there is no correspondingly growing market. The supply of Europe, leaving Great Britain out, is equal to seven-eighths of its consumption, besides seed. A few million bushels supplies Europe after the interior distribution is effected. The report sums up: "In other words, the world is striving to deluge Liverpool with wheat, and finds elsewhere, and is likely to find elsewhere, despite any law except the natural law of production and self-preservation, no markets that are worth striving for or that can enrich any wheat-growing nations." The free-trade advocates advise the American wheat-grower to depend upon this Liverpool market which the whole world is striving to supply. Under our protective policy the home consumption is rapidly growing upon home production. The foreign market is ours only when we can sell as cheaply as India, Russia or South America, while the home market is entirely our own. If no unwise legislation turns our industrial forces from manufacturing to agriculture, the proportion of wheat we shall send abroad will be less from year to year. This home market is one our farmer can depend upon. If the competition for the small English market should reduce prices below the cost of production in the United States, the tariff tax on wheat will secure the home market for our wheat-growers. It seems hardly worth while for the United States, which is importing annually from \$300,000,000 to \$400,000,000 of goods it might manufacture, to enter upon a policy which will depress its manufactures in the hope to make up the loss from increased sale of wheat in Europe.

**AMERICAN WHEAT IN ENGLAND.**—The *Providence Journal* says that the little dispute between Edward Atkinson and some English economists as to the ability of United States producers to deliver wheat in the Liverpool market at the low prices which are likely to prevail, is a matter of considerable importance to us, in view of the fact that sooner or later

we shall be forced into rivalry with India as a wheat-producing country. Mr. Atkinson's original contention was that the American farmer could make as much profit to-day on wheat at 34 shillings per quarter in Liverpool as he could when it was at 50 shillings per quarter in 1873. Naturally enough, several English critics denied this assertion. But Mr. Atkinson now brings forward figures to show that by the cheapened cost of production and transportation American wheat can be put down in the Liverpool market even as low as 28 shillings per quarter, and still be as profitable to the farmer as it was when the price was 50 shillings. The figures derived from recognized authorities certainly seem to be unimpeachable, and must be regarded as proving Mr. Atkinson's case. The fact throws light on the large reduction in railway and steamship charges that the last 15 years have witnessed. It still further postpones, too, the time when India can drive us out of the European wheat market.

**A NEW COMPETITION IN WHEAT.**—J. W. Nightengale, a member of the New York Produce Exchange, recently exhibited to that body a sample of wheat which had been grown at the Cape of Good Hope, from American seed, known as No. 1 hard Duluth. A part of the crop of the growth was sold in the London market last week at four cents cheaper than a similar quality of wheat could be bought in this country. All this goes to show that the Cape of Good Hope is in the field as a competitor in the wheat market of the world, and that American wheat prospers extremely well there.

**MEETING OF REPRESENTATIVES OF THE LEADING EASTERN FLOUR-MILLERS.**—Twenty representatives of the large exporting flour-mills of the various cities met in Chicago on the 15th of May at the call of President Seignett of the National Millers' Association to correct abuses of the foreign and domestic trade. It was proposed that two bureaus be established, one to take charge of the export trade and the other the domestic trade, the bureaus to be under the direct management of the National Association's Executive Committee. The proposition was adopted.

THE MINNEAPOLIS FLOURING MILLS are turning out larger quantities of flour than ever before. The product of March, added to that of the 52 outside mills, made an aggregate product of 931,352 barrels, against 834,215 barrels for the same month in 1887.

## THE WOOD WORKER.

### Staining Wood.

The following are receipts for staining wood, which are said to be used in a large establishment on the continent with great success:

**Light Walnut.**—Dissolve 3 oz. permanganate of potash in six pints of water, and paint the wood twice with the solution. After the solution has been left on the wood for from five to ten minutes, the wood is rinsed, dried, oiled and finally polished.

**Light Mahogany.**—One oz. finely-cut alkanet root, 2 oz. powdered aloes, and 2 oz. powdered dragon's blood are digested with 26 oz. of strong spirits of wine in a corked bottle, and left in a moderately warm place four days. The solution is then filtered off, and the clear filtrate is ready for use. The wood which is to be stained is first passed through nitric acid, then dried, painted over with the alcoholic extract, dried, oiled and polished.

**Dark Walnut.**—Three oz. permanganate of potash are dissolved in six pints of water, and the wood is painted twice with this solution. After five minutes the wood is washed and grained with acetate of iron (the ordinary iron liquor of the dyer), at 20° Tw. Dry, oil and polish as usual.

**Grey.**—One oz. nitrate of silver is dissolved in 45 oz. water, and the wood painted twice with the solution; afterward, the wood is submitted to the action of hydrochloric acid, and finally washed with ammonia. It is then dried in a dark place, oiled and polished. This is said to give remarkable good results on beech, pitch-pine and poplar.

**DENSITY OF AMERICAN WOODS.**—Of the 413 specimens of trees found in the United States, there are 16 species whose perfectly dry wood will sink in water. The heaviest of these is the black ironwood (*Condalia ferres*), of Southern Florida, which is more than 30 per cent heavier than water. Of the others, the heaviest known are the lignum vitae (*Guaiacum Sanctum*) and mangrove (*Rhizophora Mangle*). Another is a small oak (*Quercus grisea*), found in the mountains of Western Texas, Southern New Mexico and Arizona, and westward to the Colorado desert, at an elevation of 5000 to 10,000 feet. All the species in which the wood is heavier than water belong to semi-tropical Florida or the arid interior Pacific region.

**THE WHITE ASH.**—One of the most valuable of our native trees is the white ash, and, all things considered, it is one of the most profitable for planting. Combining lightness, strength, toughness, elasticity, and beauty of grain in a rare degree, it is in great and growing demand for farming tools, furniture, interior finishing of houses and railroad cars, the construction of carriages, for oars and pulley-blocks, and many other purposes. The excel-

lence of our ash is one secret of the preference given abroad to American agricultural implements. It is hardy, will bear the harshest exposure, is a rapid grower and attains large size, but will not thrive on poor lands. It is every way superior to the European ash, much as that has been cultivated and lauded abroad. It is now found widely in the nurseries and young plantations attached to the forest schools of Europe. Director General Adolfo Di Bsnanger, President of the Royal Instituto Forestale at Vallombrosa, says that it is the tree of which Americans may well be proud. The ash is a fine ornamental tree for private grounds, public parks, or for the way-side. When planted closely for timber they grow straight and free from low laterals, and early reach a size that makes the thinnings valuable for poles and fencing.

**THE WASTE OF WOOD-WORKING.**—There is an enormous amount of waste in wood-working. From the first stroke of the axe that fells the tree to the last touch of the tool that finishes the wooden article, each step witnesses the loss of some portion of the material. It is claimed by those who have studied the subject carefully that not more than 20 per cent of the tree comes into actual use, the other 80 going to waste. The waste, of course, includes the worthless limbs, twigs, slabs, knots, etc. This waste is certainly large and unfortunate, considering the growing scarcity of wood and the increasing demand for it; but there is some offset for this lugubrious view in the consideration of the fact that invention, care and discretion is constantly reducing this enormous waste.

## SAW MILL NOTES.

**A FLOATING SAWMILL.**—One of the greatest novelties of a practical character which ingenuity has devised is thus described by a Florida newspaper: J. L. Maull & Son have their mammoth floating sawmill anchored off the banks of Burton & Harrison's hammock. This structure is a marvelous piece of mechanical ingenuity, and was built by J. W. Maull and Edward N. Maull. It is 80x40 feet, and stands about five feet out of the water drawing only about 17 inches. It is solidly built, and according to the judgment of Mr. Carl, an old-time ship-builder, is capable of enduring the severe strains of even the waves of the ocean. The operation of all the machinery does not seem to move the vessel more than if it was on the land. It has so far proved more of success than its projector anticipated. It is equipped with a 40-horse power boiler and engine, with the latest improvements in saws and carriages. A planer, box-head and shingle-saws are all on deck and connected by shafting concealed under deck, so that the main deck is free from machines and available for the piling up of immense quantities of lumber. In one corner of the vessel is the cook house, where the hands board, while on the hurricane deck are the office and cabin of the proprietors and workmen. They are now so situated as to have command of an unlimited supply of the largest and finest timber, and from points heretofore practically inaccessible. A sawmill capable of moving up and down stream seeking a supply of logs and thus bringing the mill to the product instead of vice versa, may offer very valuable advantages, especially in the South.

**FASTER SAWMILLS.—SUGGESTIVE HINTS.**—J. R. McDonald is reported in the *Lumberman* as saying: "There is no mill on Puget Sound but what is conducted by the old Puget Sounders, but the Eastern men have revolutionized the method of logging on the sound, and they will make some very material changes in the method of milling before another year has passed. In our new mill at Point Defiance we are going to reduce the waste by kerf one-half, and we will put in saws with twice the number of teeth and we will run them with some respectable speed. Bless you, sir, in these mills now on the sound the managers seem content if their saws are run at the rate of five revolutions a minute. Our new saws will run ten times as fast as that." Mr. McDonald's words serve to emphasize a point that is quickly recognized by visitors from the East. It is frequently asked: "Where are all the Eastern lumbermen that come out to Puget Sound to invest in the lumber business?" The answer is always about like this: "Why, they secured some timber claims and are going to come out again in a few weeks." Most of these people get their timber land first. Some begin logging immediately, and soon it is expected that a number of good-sized mills will be put up and operated on the methods of men from the East.

**SAWING BY THE THOUSAND.**—In nearly all the mills which "saw by the thousand," says the *Wood-Worker*, lumber is not manufactured as it should be, and there is, moreover, much unnecessary waste. The interests of the millmen are naturally not those of the log-owner. The millman generally wishes to get as many thousand through his mill as possible, and he is not particular whether the lumber is well cut or not, or how much material goes to sawdust or mill wood which might be wrought into lumber. The log-owner is interested in getting as much good merchantable lumber out of his logs as possible, and he does not care particularly how long it takes to accomplish it, so long as he pays for the work by the thousand. Lumbermen who will take the pains to go to the

mills where the millmen for the most part on their own timber and job and retail their own lumber will have it demonstrated to them very quickly that better lumber is made in such mills.

**THE SAWDUST QUESTION.**—At last one Oregon sawmill is doing a good thing with its sawdust, a contract having just been made with a flour-mill close at hand for a supply of sawdust sufficient to keep the mill engine running, at a cost of \$50 per day. Even at this apparently exorbitant rate, the owners of the flour-mill cut their fuel bill in half, the present expense for this item being \$100. It is doubtful if any sawmill in the United States is doing as well with its hitherto despised dust, but it is a burning shame that millions of tons of sawdust go to waste every year in a country which needs cheap fuel about as badly as it needs anything. It is alleged that sawdust can be worked into a fuel equal to hard coal at a cost of one-fifth or perhaps one-tenth the average price to the consumer of coal, but neither inventors nor capitalists seem to have done their duty in making and placing upon the market such a fuel.

**THE MILLS OF PUGET SOUND** are all busy cutting lumber to supply the California market. They are working 11½ hours per day, the men being allowed an extra day's pay each week. There are now but few orders for foreign ports, and the advances in the price of lumber from Puget Sound over that of British Columbia has a tendency to divide the foreign trade.

## THE ARCHITECT.

**IRON AND ENGINEERING IN BUILDING.**—Iron is increasingly used in the construction of buildings, and with the increasing demand for the best forms and details of heating, ventilation and sanitation, it would appear, says *Building*, that ere long the progressive architect must be considerable of an engineer, besides having a knowledge of those things heretofore considered essential to being a first-class architect. And we would add that he must be a master steam-fitter *par excellence*. The architect of to-day, continues our cotemporary, is called upon to calculate the distribution of strains in floors composed of iron beams, and the cross-section of metal which is required at each point to safely and economically resist those strains. He must, in roof and in front, and often in floor construction, be able to figure the resistance of metal arches to complicated strains, dead and live loads, and is expected to be able to determine upon and devise forms of minimum weight of metal and of least cost to safely withstand these strains. As the heights of buildings increase, he must be able to figure their stability under high wind pressures; and if he would be fully up to his work, as superintendent of construction, he must be able to decide whether the iron delivered to him is of proper manufacture and of requisite strength and structure. Ever-increasing new schemes and devices for steam heating, ventilation and plumbing, make a demand upon the architect of a pretty thorough knowledge of the laws of physics, heat and hydraulics, and of their application in practice. Without such knowledge, the architect cannot decide whether the claims put forward in favor of special devices for heating, ventilation and plumbing rest on a sound basis or not.

**DEFECTIVE BRICKWORK.**—In 75 cases in 100 where fires occur from "unknown causes," writes an architect to the *Insurance World*, it can be traced to defective brickwork. Ordinarily an architect specifies that this brickwork shall be well slushed, and that the fines shall be well targeted or plastered on the inside. This is a great error, as no flue should be plastered on the inside, and no walls having fines in them should be slushed, as the term is generally understood. The fines in all cases should be built smooth on the inside, and all the joints should be filled with mortar, the vertical joints as well as bed joints. The lining of the flue, or the four inches surrounding the flue, should always be kept in advance of the brickwork, and the brick adjoining the lining and the second and third brick, and so on, should be shoved in soft mortar up against each other; this will fill all the vertical joints from bottom to top, as laid. The slushing that is ordinarily put in from the top only goes down into the joint about one-half inch, thus leaving an opening the entire length of the wall, and in some cases an opening which a mouse could crawl through. As it is only a question of time when all the plastering that can be put on the inside of a flue will fall off, it will leave these vertical joints between the bricks open into the flue, and as the joints cross through these joints in the brickwork, fire is liable to take place 10 or 20 feet away from the flue.

**DEADENING SOUND.**—A new method of deadening floors is to fill the spaces between a floor and a ceiling below with shavings made incombustible by saturating them in thick white-wash. It is said that this shuts out the sound more effectually than cement.

**PLASTER FOR MOLDINGS.**—Where walls and ceilings are to be molded while yet in a plastic state, some decorators are using a fibrous plaster, with the object of securing greater firmness and tenacity. The idea itself is not new, ani-

mal hairs having formerly been intermixed with lime, but this is a new application. In England and France a fine wire netting is at times inserted between two courses of plaster, to afford greater firmness in holding picture frames. The tenacity of some of the old moldings in old New York houses, while aristocratic, is very remarkable, retaining as they do their original sharpness of outlines.

**A NEW BUILDING MATERIAL.**—A new building material called stone-brick, harder than the hardest clay-brick, is made from simple mortar, but a scientifically made and perfect mortar; in fact, a hydraulic cement, and the grinding together of lime and sand in a dry state—including also some alumina, which is usually present in sand—and the subsequent heating by steam, give the mixture the properties of the burned hydraulic cements at present in use.

**CONTRACTORS.**—A gentleman having recently completed a dwelling-house, and after settling the original contracts, together with a number of large and burdensome "bills of extras," was heard to exclaim: "Contractors! why, the word contractors is a misnomer; they should be called expanders."

**IRON ROOFS AND GALLERIES.**—The Building Superintendent of New York City says that the roofs and galleries of theaters should be made of iron, and recommends an amendment of the existing law which shall make this requirement peremptory.

## Coast Industrial Notes.

A new shingle-mill at Mott, Siskiyou county, is turning out 30,000 a day, besides a large number of laths.

A fire at the West Coast Furniture Co.'s factory in this city on Monday last, caused a loss of \$20,000.

The Los Angeles Railroad has reached Burbank. A branch line is to be surveyed to Hueneme, Ventura county.

CALIFORNIA capitalists propose to take up 400,000 acres of pine timber land in New Mexico and open it by a railroad.

The big crane at the Union Iron Works last week lifted the six boilers out of the Queen of the Pacific, so that repair work on her bottom could be carried on.

At Oregon City a plant for the manufacture of cement is being put in at a cost of \$40,000. The rock is found in Douglas county, and the supply is said to be inexhaustible.

The narrow-gauge railroad from Reno is being pushed rapidly toward Susanville—250 men employed and easy grading. They are now near the Steinhilber place in Long Valley.

NO FATALITIES are reported from the Newcastle coal mine strike. The company says the mine shall stay closed till the contending labor societies settle the trouble among themselves.

A FURTHER decline has taken place in lead. Very large stocks remain in speculative hands, stored, which, as long as they remain unabsorbed by consumers, will have a depressing effect on the market.

The California Fruit Union has decided to continue the auctioning of fruit in the Eastern cities. Members will be allowed to ship on direct rate by paying the union \$30 per car-load for extra expenses, etc.

The hydraulic dock of the Union Iron Works is in constant demand. As fast as one vessel is repaired and removed another one is ready to take her place. The works are crowded with marine work of various descriptions.

CHINESE fruit-dealers are buying up the cherry and other fruit crops in many localities about Napa. They buy the fruit on the tree, and pick, pack and ship to San Francisco. They are shrewd buyers and hard workers and make the business pay.

The Pacific Varnish Company has incorporated with \$100,000 capital to do a general mercantile business. The capital is divided into 1000 shares. The directors are T. J. Chadbourn, J. C. Libbey, W. H. Worder, Charles W. Kellogg and Cary Howard.

NEARLY all of the local cigar dealers have large stocks on hand, and as a result work at the factories has been slack. In some instances manufacturers are running their factories on full time, but in others many of the employes have been given a spring vacation.

The solid men of Helena, Montana, have subscribed and planked up their oakh for nearly \$200,000 of the \$1,000,000 stock toward the erection of a mammoth smelter, etc., at or near Helena, and which action gives positive assurance that the institution will go ahead without further delay.

WIND power is now being utilized to a greater extent and in a greater variety of ways in California than ever before. Formerly it was confined to water pumping, but the wonderful improvements by which the manufacture of the iron windmill has been marked, have rendered it an effective substitute for steam in many places.

The new yacht being built for Captain Geo. Engel at Stone's shipyard, South San Francisco, is now all in frame, and has her decks and ceiling in. She is very near the same model as the *Realtess*, and will be 47 feet long; beam, 15 feet; depth, 4 feet, 6 inches. She will be fitted with

a cabin 6 feet high, have a kitchen and toilet-room, and four staterooms. She will be named the *Volunteer* and will cost \$4000.

It is stated that the Merchants' and Ship-owners' Tugboat Company have contracted with George Boole for a new steamer, to be 105 feet long, the machinery of which will be constructed by the Fulton Iron Works with all the latest improvements. She will be finished about October next.

At the Union Iron Works, in this city, a night shift has been working in the machine-shop of the works for some time, finishing a new cylinder for the steamer *San Jose*. The mammoth pumps for the Spring Valley Water Works at Belmont have been completed. The pumps and fittings weigh nearly 250 tons.

The last rail of the Los Angeles Company's railroad was laid on Saturday. The line extends from Los Angeles to Burbank, with a branch at Santa Monica. Two broad-gauge 35-ton locomotives and standard coaches will be used. Burbank secures the round-house and car-shops, and a branch line is to be surveyed to Hueneme.

A FRESNO paper states that Mock, Humphrey & Co. are at present constructing a new mill on the Reynolds claim. The mill will be supplied with the latest improvements in milling machinery and will have a capacity of 40,000 per day. Mr. A. Littlefield, not to be behind the times, has built him a water-power mill for the express purpose of manufacturing brake-blocks.

The total increase in the River and Harbor Bill, as reported to the Senate, is about \$1,500,000. The appropriation for Oakland is made \$350,000; for Wilmington, \$62,500; the canal at the Cascades, Or., \$300,000; the mouth of the Columbia, Or., \$500,000; the lower Willamette and Columbia in front of and below Portland, Or., \$100,000; the Willamette above Portland, \$29,000; Tillamook bay, Or., \$50,000; Yaquina bay, Or., \$150,000.

The Frazier sawmill, on Bear creek, one of the tributaries of Tule river, Tulare Co., has received a thorough overhauling within the past two or three weeks, and on Monday last commenced sawing lumber. The mill has a capacity of 40,000 feet per day, and an effort will be made to run it to its full capacity during this season. The mill is situated in the midst of the finest body of pine and redwood trees to be found in the Sierra Nevada mountains.

The local manufacturers of stained glass reports a large increase in their business this season as compared with that of last year. There is hardly a new cottage now going up in which stained glass is not used in one form or another. Much of the cheap colored ware comes from the East. Our manufacturers do not go into that line very extensively. There is more money in the better class of material, although it necessitates skilled labor and greater cost.

The San Joaquin Lumber Company has contracted for all the lumber that may be sawed by the Green & Kimball sawmill, on Dry creek, this season, all of which is to be delivered at Traver and the new town in the 76 country. The lumber sawed at the Comstock mill, which is expected to reach 3,000,000 feet this season, will all be delivered in Visalia, and what is not needed in this market will be shipped to points west and south of that city.

TRAMS loaded with lumber are coming from the sawmills in the mountains to Visalia every day in this week now. Last year it was a difficult matter to secure teams for this work, and many thousands of feet of lumber were left at the mills. This season, owing to the limited grain crop, no trouble is likely to be experienced in this line, and probably every foot of lumber that is sawed will be delivered on the plains before the snow again falls. And the demand for lumber, too, is likely to equal the supply.

The Red Funnel Tug Company has contracted for a new tug. The hull is to be constructed by George Boole, while the engine and machinery will be put in by the Fulton Iron Works. The new tug will be 105 feet over all, 22 feet beam and 11 feet 6 inches in depth of hold. She will have a vertical compound surface condensing engine, with the cylinders fore and aft. The diameter of the high-pressure cylinder will be 20 inches, while that of the lower pressure will be 40 inches, with a 26-inch stroke.

The new drawbridge of the San Francisco and North Pacific road across Pataluma creek is completed. The draw is the largest of its kind in the United States. The bridge itself is 3100 feet in length, the draw being 226 feet long, and the base 10 feet above the water line. The draw weighs 125 tons, can support a load of 290 tons, and rests on piles incased in iron. It is intended in the near future to discontinue the ferry service to Donahue Landing, and to have all passengers for the Sonoma Valley road go over on Tiburon boats.

BRODER & MOORE are having a steam engine and pump put in repair at the Agricultural Iron Works in Visalia which they intend to use in running a roller quartz mill at Sampson's Flat, 40 miles northeast of this city. They are also having shafting manufactured at the same works. The claim they propose to use the machinery on is named the "Sampson Flat Mine," and the quartz mill has a capacity of 10 or 12 tons per day. The ore from the mine assays from \$20 to \$60 per ton in gold. The mill has already gone forward to the mine.

Two or more of the British Columbia mines are making arrangements for increasing their

supplies. The Vancouver is putting in new machinery, working a new slope at the Southfield mine, and has put in a large fan for better ventilation at the No. 3 shaft. Dunsmuir & Sons will sink a new shaft midway between the Wellington and East Wellington properties. It is expected that this improvement will open up a large area of coal lands. Upon the completion of these arrangements we shall have more coal from British Columbia. The coal from that source is somewhat stronger than that received from most of the deposits in Washington Territory, and largely takes the place of Cardiff for steam purposes.

WORK on the Charleston at the Union Iron Works shipyard is being rapidly pushed forward by night and day shifts. The heavy side-plates of the outer sheath are now being riveted. The engines for the cruiser are lying in the shops ready to be set up as soon as the vessel has been launched. Material for cruiser No. 2 is being transferred to this spot, and preparations are being made to lay the keel as soon as the Charleston comes off the ways. The Pomona, the new 2000-ton coast steamer built for J. N. Knowles, was launched last week. The steamer is to be fitted for service on this coast. She is 230 feet in length, 33 feet beam and 26 feet in depth, and will register 1250 tons net. She is expected to attain a speed of 17 knots. The vessel will cost \$250,000.

JOHN W. MACKAY has inspected the California mill and its motive power thoroughly, and it is now pretty well settled that as soon as the Carson river fails to furnish enough power to continue the regular payment of dividends by the Con. Cal. Va. mine the California mill will be started up. Three-quarters of the mill will be run by water-power. Two wire ropes will be adjusted to run one-half of the mill, and one rope will run one-quarter of it. By detaching the main driving shaft at the pan mill to make two ropes run one-half of the mill, and one rope run one-quarter, the defects pointed out on the surface transmission of power are overcome, if the strain is equalized by a slack-catching gear. The company has a new complement of rope on hand, which will last not less than nine months under the new arrangement.

THE Portland Linseed Oil Co. has recently been formed at Portland, Oregon. Negotiations have been pending for some days for the purchase of a suitable location. This it is understood has been effected. Two blocks have been purchased on the line of the Northern Pacific, in the lower portion of the city. Since Mr. H. J. Corbett went East in the interest of the stockholders, it is learned that certain machinery, which it was hoped could be secured, cannot be obtained. This failure will necessitate the building of new machinery especially for the projected mill, and will involve an additional outlay of \$30,000. Plans and specifications for the building have already been completed, and now that the ground has been secured and arrangements in progress for purchasing the machinery, active work will doubtless be commenced soon. Six months it is expected will be all the time required to have the mill in readiness for operation from the date of the actual commencement of the work.

IN Siskiyou county, Hon. R. H. Campbell made a partial clean-up last week in his Quartz Valley hydraulic mine and realized over 1000 ounces. He has had an abundance of water to continue operations longer than usual this season, and will take out not less than 4000 ounces, or about \$60,000. The system of moving the banks by use of giant powder is a great help, and electric lights for night work has also been a great benefit. A company, comprising of leading citizens at Etna and Salmon river, has been organized to inaugurate one of the most extensive mining enterprises ever entered into in that section, for the purpose of working rich mining ground at Salmon river, some of whom now own claims. The object is to consolidate all the claims under one management and operate them on an extensive scale. The whole body of Salmon river is to be utilized in supplying two large ditches, at a cost of probably \$40,000, which would cover all the mines from Summerville to a point five miles below the Forks of Salmon, a distance of 30 miles. This company have now located 100 acres in addition to what they already own, besides bonding several other claims.

WHEN the Pacific Rolling Mills of this city cast the stern-post of the cruiser Charleston last June, it was, up to that time, the largest steel casting ever made on this continent. It weighed 15,000 pounds. On Saturday last, the same mill cast the stern-post of cruiser No. 5 (the San Francisco); the weight being 21,000 pounds. A great trench, 40 feet long, had been excavated in the floor of the foundry and suited to the angular shape of the stern-post. Weeks had been spent in the preparation of the pattern and in the construction of a perfect mold. Every precaution which the experience of the management and the skill of the workmen could suggest had been taken, and Saturday every condition was perfected, the valves were opened, and in less than 15 seconds the whole 30,000 pounds of molten steel were emptied from the furnace into the mold, and, to all appearances, the casting was successfully accomplished. The casting, besides being very successful, was a remarkable quick one, it having been accomplished in one-quarter less time than was occupied by the stern-post of the Charleston.

HOSKIN'S  
IMPROVED  
ONE-JOINTED

HYDRAULIC MACHINE.

The statement of Mr Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleeing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et al.

We also manufacture the Single-Jointed Giants.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

# FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco

HOOVER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

# THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

## JAMES LEFFEL'S

## Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.  
Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.  
Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**POWER MECHANISM.**—Wm. A. Howard, Petaluma. Assignor of one-half to Chas. W. Adamson. No. 383,295. Dated May 22d, 1888. This invention relates to the class of mechanism for applying power to operate pumps and other machines. It consists in an annular series of connected pivoted levers, each having a connection with the machine or machines to be driven, and in a rolling wheel or wheels traveling over said levers, whereby they are all simultaneously oscillated, adjacent ones in opposite directions. The invention further consists in connection with said levers and the rolling power wheel or wheels, of a fixed circular track concentric with the series of levers, and upon which said wheel or wheels travel as they run down successive levers.

**STATION INDICATOR.**—John C. Ludwig, S. F. No. 383,230. Dated May 22, 1888. This is one of that class of station indicators in which a ribbon bearing the names of the streets or stations is made to travel upon suitably arranged drums by means of a clock-work mechanism which is periodically set in operation and checked again. And the invention consists in a peculiar escapement and ebecking mechanism, and in the connection of the alarm apparatus therewith. Several details of construction are covered by the patent.

**COMBINED HARVESTER AND THRASHER.**—Don C. Matteson, Stockton. No. 383,233. Dated May 22, 1888. In this machine the header frame is hinged to the side of the thrashing frame so as to be removable in the usual manner when it is desired to transport the machine or to pass through narrow gates or openings, where it would be impossible to transport the machine as a whole. When this is done, the wheel at the outside of the header frame is removed and a pair of wheels or trucks is placed beneath the header frame so that it may be thus drawn in a direction at right angles with the usual mode of progression. As the supplemental wheels upon which this portion is transported when separated from the thrasher stand at right angles with the usual direction of motion, it will be seen that it will travel in a line parallel with the sickle, and the folded-over portion will thus narrow the machine so considerably that it may pass through gates which are of any of the usual dimensions. A new device is also employed to prevent loss of grain at the point where the spout of the belt from the header discharges upon the feeder belt.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JOHN G. H. LAMPADUS—Santa Barbara Co.  
G. W. INOALLES—Arizona Territory.  
A. F. JEWETT—Tulare Co.  
C. E. WILLIAMS—Yuba and Sutter Co.'s.  
R. G. HUGGON—Montana Territory.  
G. D. CUMMINS—Butte and Tehama Co.'s.  
J. L. DOYLE—Kern Co.  
W. W. THORALDS—Contra Costa Co.

MEMORIAL DAY was appropriately celebrated in San Francisco and Oakland by public exercises and processions to the cemeteries, where the graves of the Veterans were decorated with flowers. Wednesday was observed as a general holiday.

## Mining Share Market.

There is very little activity in mining stocks. No session of the board occurred on Memorial Day. The Comstock mines continue vigorous work with increasing bullion output. Con. California and Virginia shipped during the last week 1185 tons ore to the Morgan mill and 1836 tons to the Eureka mill. This ore assayed \$36.37. Bullion valued at \$20,000 is now on hand at the Virginia office, and \$80,590 was shipped to the Carson Mint during the week. Gold and Curry last week took out 224 tons, assaying \$28.49, and has bullion valued at \$64,000 on hand. Savage has shipped \$28,000 on May account, and sends to mill daily 80 tons, assaying \$25.

From Hale and Norcross ore shipments for the week aggregate 1400 tons, showing an assay of \$37 per ton. Bullion valued at \$70,574.97 on hand on May account.

From Confidence ore shipments of 190 tons continue daily, showing a value of \$34.20 per ton.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Germania, May 22, \$1,797; Hanauer, 27, \$4,200; Queen of the Hills, 22, \$2,250; Con. California and Virginia, 26, \$80,598; Savage, 20, \$28,000; Hale & Norcross, 26, \$70,574; Hanauer, 27, \$4,200; Germania, 27, \$1,911; Hanauer, 27, \$2,110; Crescent, 24, \$2,000; Hanauer, 25, \$2,100; Crescent, 25, \$1,595; Lexington, 20, \$38,860; Alice, 20, \$13,992; Blue Bird, 16, \$18,560.

**THE COPPER SYNDICATE.**—The French syndicate is not satisfied with binding the leading producers of copper throughout the world in a three-years' contract not to sell under a certain figure, supposed to be 13c, but has now made contracts with copper consumers. In this way it hopes to protect both parties with a cast-iron rate, which is remunerative to all parties. Referring to this last operation of the French syndicate, a contemporary says: "The contract is for between 30,000,000 and 40,000,000 pounds at 16.50 cents. The terms were originally for six months, but it is believed it has since been changed to four months; it is certainly not less than the latter. The syndicate agrees not to allow the price to decline below 16.50 cents. The consumers, on their part, can purchase what copper they want for consumption, but cannot resell upon the market, and as all ingots, cakes and bars are stamped, they can easily be traced, and the party found reselling can be held liable under the contract."

**A BIG DODGE CRUSHER.**—The largest ore-crusher ever built was completed at Savage's foundry this week for Parke & Lacy, for shipment to Australia. It is of the Dodge pattern and is called the Giant. The size of machine is 15x20 in. It weighs 16 tons and has a capacity of 500 tons of ore per day. This machine has all the latest improvements. A number of Dodge crushers are now being built for Australian mines.

## New York Metal Market.

Telegraphic advices dated May 31st give the following New York prices:

BAR SILVER—91½c per oz.  
BORAX—9c.  
COPPER—LAKES—\$16.60.  
IRON—No. 1, \$22.00.  
LEAD—\$4.07½.  
TIN—\$19.60.

The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Nominal, spot closing at \$16.60. Transferable Notices (Lake) issued at \$16.20.  
LEAD—Firm, at \$4.00 spot. Transferable Notices issued at \$4.20.  
TIN—Nominal at \$20.60.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @—Baltimore Copper, \$16.00. Banca Tin, @—Baltimore Copper, \$16.00. Orford Copper, \$16.60. P. S. C. Copper, @—Foreign Lead, \$4.60. Foreign Spelter, \$5.60. Antimony, \$10.50.

THERE have been great floods this season in Kansas, Nebraska and parts of Minnesota.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

WILLIAM CUNNINGHAM has been elected secretary of the Eureka Consolidated Mining Co., in place of H. R. P. Hinton, resigned.

J. A. JOHNSON, 307 Montgomery street) the Nevada Bank building) is the general agent of the Siles quartz machinery, and offers easy terms for introduction.

## To Every Pump Maker, Owner! Runner! Agent!

If there is ANY PRACTICAL QUESTION concerning ANY APPLICATION or ANY ADJUSTMENT of ANY KIND of a PUMP which is not answered in MR. ROBERT GRIMSHAW'S PUMP CATECHISM, we would like to have it for answer in the next edition or volume.

The Author will answer any such question in our columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if they have a practical bearing.

Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps in the market. This information can be had in no other shape or place. Price of the book, post-paid, only \$1, and worth \$5.

DEWEY &amp; CO., 220 Market St., S. F.

## Books on Assaying.

BY C. H. AARON.

## PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") has been "unsuccessfully" written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

## Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scourification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 222 Market street, San Francisco.

## PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price \$1.75.

DELINQUENT NOTICE.

**Butte Creek Hydraulic Mining Company.**  
Location of principal place of business, 213 Market St., San Francisco, Cal. Location of works, Butte county, California.

NOTICE—There are delinquent, upon the following described stock, on account of Assessment No. 12, levied on the 27th day of March, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.
J. D. Dexter, Tr.	46	100	5 00
J. D. Dexter, Tr.	48	100	5 00
J. D. Dexter, Tr.	49	100	5 00
J. D. Dexter, Tr.	63	500	25 00
Ed. Dexter, Tr.	80	500	25 00
Chas. Moss	92	500	25 00
B. Frank Moss	95	500	25 00

And in accordance with law, and an order of the Board of Directors, made on the 27th day of March, 1888, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 213 Market street, San Francisco, Cal., on Monday, the 25th day of May, 1888, at the hour of 1 o'clock P. M., of said day, to pay Delinquent Assessments thereon, together with costs of advertising and expenses of the sale.

LOUIS R. LEVY, Secretary.

OFFICE—213 Market St., San Francisco, Cal.

POSTPONEMENT.

The above sale day is hereby postponed to MONDAY, June 11, 1888, at the same hour and place. By order of the Board of Directors. LOUIS R. LEVY, Secy.

MEETING NOTICE.

**Office of the Alabama Mining Company,**  
Corner of Fifth and Stevenson streets, San Francisco, California, May 12, 1888. Location of works, near Newcastle, Placer county, California.

NOTICE is hereby given to all the Stockholders of said Alabama Mining Company (a corporation) that there will be a general meeting of the Stockholders of said company held at the office of said company at the S. W. corner of Fifth and Stevenson streets, in the city of San Francisco, Cal., on Monday, the 11th day of June, A. D. 1888, at the hour of 1 o'clock P. M., of said day, for the purpose of removing from office the following named Directors of said company, to wit: Owen King, William Reinhold, Samuel Jones and Michael Hoffman, and for the further purpose of filling by election then and there the vacancies that may be caused in the Board of Directors by such removals.

The undersigned is the owner of more than two-thirds of the capital stock of said corporation, as well as a Director and President of said Company, and makes this call under the provisions of Section 310 of the Civil Code.

J. J. SMITH,

President of the Alabama Mining Company.

MINING MEN

And the Public Generally!

AN UNPARALLELED OPPORTUNITY FOR INVESTMENT.

S. P. DORSEY, representing over three-fourths of the capital stock of the Maryland Gold Quartz Mining Company, of Grass Valley, which is divided into 500,000 shares, par value, \$20 per share, desires to dispose of a sufficient number of shares to develop this property, the value of which has been thoroughly demonstrated by the continued prosperity of the ledge, from its commencement in the Eureka through the Idaho to the Maryland line; the productive record of said mines being about \$15,000,000. The wealth of this wonderful and world-renowned ledge is shown by the latest workings in the Idaho to be as finely developed close to the Maryland line as in the richest part of its past course.

Any one investing in this property, can be assured of a continued success equal to its predecessors, viz.: Yielding 25 per cent in dividends per year upon the price at which the stock is offered for sale—viz., \$2 per share.

For further particulars inquire of

S. P. DORSEY,

At the Express Office, Grass Valley, Nevada County, Cal.

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St. S. F.

THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

## MINING MACHINERY.

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.  
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

# The Pelton Water Wheel

Gives the highest efficiency of any Wheel made, and is the standard for high pressure service in all parts of the world. Over Five Hundred are in use on the Pacific Coast alone, running Quartz Mills, Hoisting and Pumping Works, Electric Plants for power and light, as well as for various manufacturing purposes.

They are adapted to any head of water from 20 feet up to 1000 feet. These Wheels are now coming largely into use in connection with Electrical Transmission, furnishing power which is carried long distances with but small loss.

Address:

**THE PELTON WATER WHEEL CO.,  
127 First Street, San Francisco, Cal., U. S. A.**

A. P. BRAYTON, JR., General Manager.

L. A. PELTON, Consulting Engineer.

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. | D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. | J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

## THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

### ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?

Are you going to make any change in machinery? Are you freighting by team or packing on mules? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of

THE DODGE PATENT INDEPENDENCE

### WOOD SEPARABLE OR SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and

Most Convenient Pulleys Made in the World.

Entirely new and original. Adapted to any power required. Time, trouble and money saved by using these pulleys.

Price List and Catalogues mailed free.

JOHN SIMONDS, Pacific Coast Agent, 509-513 Mission St., S. F.

### SQUARE FLAX PACKING,

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. Limitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center its entire length. See that you get it and take no other. Sold by all Hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market St., San Francisco, Cal.

## Transmission of Power by Means of Electricity.

The transmission of power by means of electricity had its birth at the Vienna Exposition of 1873. The distinguished French electrician, Fontaine, there tried one Gramme dynamo as a generator of electricity, which he conducted to another Gramme dynamo, which was used as a motor in another part of the building, after having failed to get an electric battery, which he had provided for the purpose, to run the motor.

This was done after sleeplessly studying the matter over a whole night. He increased his circuit until there was more than 1½ miles of wire in it, and the motor ran a pump with "great success." It now seems strange that this had not been done before, as dynamo and electric motor had been known then for over 30 years. Fontaine's experiment effected the transmission of a part of the power applied to drive his dynamo to the electric motor which ran his pump. That which was 15 years ago a great scientific discovery is to-day a practical, every-day matter-of-fact, in a great many places, not alone in San Francisco, but in many of the cities of the United States and Europe.

From time to time we have made note of these applications of electricity in the columns of the PRESS. But now the matter comes nearer home. This publication is printed on a press run by an electric motor, and our customers, subscribers, friends and visitors are brought to our editorial and publication room by an elevator worked by like apparatus.

This power, supplied to us by the Pacific Power Company from a distance of several city blocks, leaves nothing to be desired. It is steady, cheap, noiseless, odorless, free from dust, ashes and dirt, reliable and "altogether lovely." We are going to describe it for the benefit of our readers, and point out some of the many advantages electric power has, not only in the cities and towns, but in the mines and mills of the country.

The engraving shows one of the electric motors made by Prof. N. S. Keith, the well-known electrical engineer of this city. Those operated by the Pacific Power Company were made by him, and this company has adopted them as the best after a long and exhaustive trial.

The massive frame of the machine is an electromagnet. An electromagnet is a piece of iron surrounded by coils of insulated wire which, when in operation, carry a current of electricity. The current of electricity, so flowing, makes the iron magnetic; one end of the iron has north polarity, and the other end has south polarity. These ends, no matter what the shape of the iron, are called respectively north and south poles. In this machine, or motor, each of the poles embraces about one-third of the armature. The armature is the cylinder shown inclosed at the right-hand part of the engraving. The end of the magnet above the armature is the north pole. That is to say, that is the end which is attracted by the north magnetic pole of the earth. The other end, which is below the armature, is the south pole. The side of the armature next to the reader has north polarity, and the opposite side has south polarity. These four polarities are conferred upon the magnet and armature by the current of electricity which flows from the source through the wires surrounding the magnet and armature.

The armature is a cylindrical electromagnet. As the like poles of two magnets repel, and the unlike poles attract each other, it follows that, as the armature is free to rotate on its axis, it must rotate in the direction from the north pole and toward the south pole on the side next the reader, and oppositely on the other side, and that continuously if the conditions be preserved. To preserve the condition in the armature, an instrument called a commutator, is provided and mounted so as to rotate with the armature. The commutator is the small cylinder at the left of the armature. In this particular case this commutator is made up of 60 sectors of copper, each electrically insulated

There seems to be no practical limit to the sizes. We have not the space at this time to devote to an exhaustive consideration of this subject. That belongs to the specialist in electrical science, but we shall ere long publish more about this great modern development. At present we are recording the accomplished fact.

More than a year ago the Pacific Power Co., a corporation which rents rooms and power to many customers on Stevenson street, in this city, started, experimentally, the transmission of power by means of the Keith dynamos and electric motors. After some months' trial and thorough investigation of it and other electric-

night in lighting, but which lies idle during the day.

We have noted in our columns from time to time various electric-power applications in mining localities, either proposed or executed. Now as to the possibilities. This method of transmission of power is extensively available in California and the States and Territories through which run our vast mountain chains. There are many mines located on mountainsides and tops which are almost inaccessible for fuel supply, and often without water for steam when even fuel can be obtained. There are many mills located at undesirable points away from the mines, where they have been put in order to have suitable power. There are many mines which would be worked were there power available for hoisting, pumping, milling, etc. There are many mining districts in which there are abundant water-powers unavailable for mining and milling on account of locality. The electric transmission of power furnishes the means for overcoming these existing difficulties. In this way power can be transmitted up, over and down mountains, into mines, tunnels, shafts, drifts, hacks, everywhere; to run mills, pumps, hoists, drills, locomotives, etc.

Power companies can locate dynamos at the available water-powers, and transmit the power by means of the dynamos, wires, and motors to the places where wanted, and in the desired quantities in the several places, even though they be miles in all directions apart and away from the water-power. It seems like a tale of the Arabian Nights. But it is not fancy, it is fact. Wherever fuel is dear, or at all difficult to obtain, and water-power can be had within a few miles, that power can be transmitted for use in place of that from fuel.

In another number of the PRESS we will consider the two methods of electric power transmission. Meantime we advise our readers to send to Prof. Keith, (whose card is in our advertising column), for his circulars, etc.

ACADEMY OF SCIENCES.—At the last meeting of the Academy, Prof. Josiah Keep of Mills' College demonstrated a newly discovered but simple method of finding the capacity of water tanks, tubes, cylinders, pans and pails, and other containing vessels. Prof. L. A. Lee, Chief of Staff of the United States Fish Commission on the steamer Albatross, made a gossip and entertaining address, in which he briefly described the voyage of the Albatross, the adventures of the party, their methods of work and deep-sea dredging.

THAT SUTRO TUNNEL SUIT.—The suit brought by John Landers and others, former trustees of the Sutro Tunnel Co. to set aside the election of Theodore Sutro, P. H. Lillenthal and others of the present trustees, has been dismissed, a demurrer to the complaint having been sustained by Judge Wilson, and the plaintiffs having failed to amend their complaint within the time allowed them.

A CORRESPONDENT of an Oregon paper announces the re-discovery of the Lost Cabin mine in the vicinity of the Lookout mountains. An old shaft has been found in which was an old rusted pick and a four-foot ledge. Three human skulls are said to have been found near by.

THE man who is building the great smelter at Tacoma is Dennis Ryan of St. Paul. The machinery will soon arrive.

KEITH'S MOTOR FOR ELECTRIC POWER.

from all the other sectors except through the wire which branches off each sector to the wires of the armature. The electric current is conveyed to and from the armature through the springs or brushes which may be seen pressing with one end each of the two on diametrically opposite sectors of the commutator. The electric current which actuates the armature enters it through the brush near the reader, and by the sector under the end of that brush. After passing from that sector through the wires of the armature it finds its exit through the diametrically opposite sector, and the brush which has one of its ends bearing on it. As the armature rotates the many sectors of the commutator come successively under the brushes, and in that way the electricity flows into and out of the armature wires always at approximately the same places in space, though at continually changing points on the armature. This preserves the polarity of the armature at constant places in space, even though it rapidly rotates, because the poles of armature and magnet are continually pulled toward each other and repelled as well, according to the law of attraction and repulsion of magnets.

All other things equal, the strength or power of an electric motor is somewhat in proportion to its size or mass. Therefore motors are made of all sizes, from the smallest fraction of a horse-power to even a hundred or more,

power systems, the Power Co. adopted it as the best of any now known. In a recent circular the company states that it has now in operation two circuits of 40-horse power each, and has in active preparation a 200-horse power compound-condensing Corliss engine, dynamo, etc., to add to the plant. Over 400 operatives daily depend for work on the electric-power furnished by this concern. This number includes printers, jewelers, glove-makers, embroiderers, shoemakers, clothiers, sewing-machine agents, saddlers and harness-makers, spice and coffee-grinders, machinists, brass founders, etc.

That which is being done and is to be done in the way of electric transmission of power in San Francisco, can and will be done in other places; for the power is cheaper and in every way preferable to that from steam or gas. The whole equipment consists of large and economical boilers and engines running large dynamos from which extend wires to the many motors in the several localities where power is used, often at great distances apart and from the dynamos station. The Power Co. supplies the motor, wires, electricity, attendance etc., at a contract price per month, leaving nothing for the user to do but to put oil in the oil-cups and pay the price. In other places the electric light companies seem to be likely to have the best possible conveniences for this work; because they have a power capacity which they use at

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents. — EDS.

## Placer County Mines.

## A New and Promising Quartz District.

EDITORS PRESS:—For some years past but little prospecting has been done in Placer county, that is, so far as quartz is concerned; but now the ledges that traverse this section of California are receiving more than ordinary attention, and the probabilities are that the quartz fields of Placer county will, in the near future, command the attention of the mining world.

The Ball mine and the property operated by the Zneraft Bros., located but a few miles distant from Newcastle, are both unfolding well, and give promise of becoming fine ore producers when necessary developments will have been placed on their respective properties. To-day they are both paying enterprises, but as yet development is only in its infancy. Valentine Bros., San Francisco capitalists, are prospecting a valuable gold-bearing quartz property within a short distance of the town of Newcastle, and from present indications it will not be long before reduction works will be erected and the mine operated upon its merits.

Drs. Schnabel and Berry are also placing improvements upon a recent discovery that upon the surface shows handsomely, and if the present flattering prospect has a home deeper in the ground, it will unfold into a mining enterprise of the most encouraging and profitable character. Dr. Schnabel is a public-spirited man, and takes an absorbing interest in the developments of our mineral resources and is ever ready to lend a helping hand and launch his money into underground developments where surface indications warrant an investment. Your correspondent has only mentioned a few of the prospects that exist in this immediate neighborhood, merely for the purpose of showing that our quartz fields are not entirely neglected, but that an interest is still taken in the development of such properties.

The eastern portion of the county, however, is where the future quartz bonanzas will be opened up. Here the indefatigable prospector has not been idle, but to the contrary, has penetrated the deepest recesses of our mountainous country, and there sought for the precious metal that has lured our mining-men, in the face of the most discouraging obstacles and dangers, to those fields that gave promise of becoming gold producers. This newly discovered district is one of the most promising, and is possessed of greater surface merit than any mining field that has been opened up in California for many years. In the vicinity of Auburn, and in the low hills that skirt the Sierra Nevada range, pocket hunting, with but few exceptions has been the nature of the mining engaged in, but this sort of work is uncertain, and in fact so precarious that none but expert prospectors, or those who recklessly invest their money care to face the desperate chances that attends such mining. In the new district alluded to the ore bodies are continuous, or exist in paying chutes or chimneys, and the man who invests his money in such properties does so with the firm assurance that his ledge is permanent and the ore bodies in them of such dimensions as to preclude the possibility of a failure. This new and promising gold field is located in the mountainous country lying between the middle and north forks of the American river, but a short distance from the old Last Chance district. In early days it will be remembered that a large quantity of quartz gold was taken from the placer mines in this vicinity, and it was this fact that influenced prospectors to search for the ledges that fed such claims. That their efforts were amply rewarded is substantiated by the rich and valuable discoveries they have made, ledges that have shown decided improvement as depth was attained, and though development is as yet only of a meager type, the properties operated are unfolding in the most encouraging manner. The ledges are strong, healthy and well-defined, showing every indication of permanency and range in width from four to seven feet, and in some instances are much wider. The formation is slate and of that nature that guarantees a sure home for the handsome veins that traverse through it from north to south. The country rock is bright, highly mineralized and does not show any indication of having suffered in any manner by internal convulsions or glacial action. It is, figuratively speaking, "rock in place."

The two most prominent mines at the present time are the Nimrod, operated by Glece & Corey, and the discovery claim known as the Leopard. The showing in both properties above mentioned is of the most flattering nature, and even though no other discoveries had been made would insure a bright future for the camp and be a source of wealth to their respective owners. Both mines are most advantageously located for thorough and rapid development, but so far only limited work in the shape of shafts has been performed. The owners, as is usually the case, are poor men and their labors have been principally directed toward proving the ore bodies they have encountered, and not with a view to opening their mines in a systematic manner. So far as this work has progressed, however, results have been of the most gratifying nature, so much so,

in fact, that negotiations are now pending for the erection of a mill on each property. The main vein in both locations varies in width from 7 to 10 feet, but within the same locations and distant from the main ledge 100 feet, is another equally as rich, and four feet in width. Both veins are pitching toward each other, the larger one at an angle of 20 degrees and the smaller one at 45 degrees. It will thus be seen that a confluence of the two ledges will take place at no great depth, where an extensive and rich body of ore will surely be encountered unless one of the heretofore infallible indications in quartz mining proves to be a failure. The gangue in both veins is composed entirely of quartz, all of which shows a paying average of rock and improving in richness as work progresses. No piece of ore can be taken from either of these properties that does not yield a paying prospect, and the character of the rock is such that improvements can be placed upon them rapidly and at light cost. In the immediate neighborhood is an abundant supply of the finest timber for mining or building purposes and also a sufficient quantity of water at all seasons of the year for milling purposes. In fact, every natural facility exists for the successful working of the mines, and it is only a question of a short time when reduction works will be running and a permanent and heavy gold-producing camp will be established. In winter the snow falls to the depth of several feet, but will not interfere a particle with operations in the mines, if those operating them have the forethought to lay in their supplies and make necessary preparations for the winter season.

Every mining man who has visited this promising district has pronounced it one of great merit and that it will sooner or later become one of the leading quartz fields in the State. The fact that the ore is in a manner continuous, and that the ledges from wall to wall will pay to work, is sufficient to recommend them to those who mine. This season a great amount of work will be performed in this district and it will also be thoroughly prospected for new discoveries. Gold properties are in demand, and such mines as are to be found here will find ready buyers. A mill or two planted in this district will very soon bring it into prominence, and the probabilities are that such works will be in operation before the season ends. The gold is entirely free and is generally diffused through the rock, and the ledges are of such dimensions that no wall or waste rock need be moved in forwarding improvements or in extracting the ore bodies. More information will be furnished your readers regarding this district before the season ends. MINER.

Newcastle, Placer Co., Cal.

## San Bernardino County Mines.

[From our Correspondent.]

It is now nearly three months since I wrote you regarding the mining interests of this county, since which time considerable progress has been made, especially in this neighborhood.

## The Black Hawk Mines.

Some 30 miles east of Victor station, on the California Southern R. R., which was undeveloped when I wrote you, has since been pretty thoroughly prospected and has proved of even greater magnitude than I predicted.

The owners (J. B. Cook, O. G. Leach and J. E. McFee) have had a force of men working the past three months on their "Lookout" mine. They have run two tunnels of 100 feet each at points on the ledge some 300 feet apart, besides numerous cuts, drifts, etc. This mine now shows a body of ore in face of the work done (the ledge lay almost horizontal) some 20 to 50 feet in thickness, exposing a solid mass of ore of over 200,000 tons.

The ledge has been cut across at the end of each tunnel, and in one of the tunnels at 50 feet, demonstrating the width of the vein. The surface of this claim shows a chimney of ore over 1000 feet in length, which has been cut by an immense canyon exposing the ledge for that length.

The owners claim that this unparalleled body of ore will fully average \$10 per ton. It is certainly the most extraordinary deposit of ore that your correspondent has ever seen. The fine ore of this mass washes perfectly free without reducing to pulp, giving extensive panning results. A strange feature of this wonderful ledge is that they have not used any powder in all the work they have done—not even one blast. The facilities for working could not be more advantageous; the mine will never require any hoisting works, nor can it ever be troubled with water. There are numerous strata of rich ore throughout the mass running from \$100 to \$500 per ton of free-milling gold.

Besides this mine they have several ore bodies on their numerous claims, showing a ledge surface of nearly equal magnitude and some very high-grade ore.

I understand it is the intention of the owners to ship some of the ore to San Francisco at an early date, so as to thoroughly test it.

It is quite impossible to describe this ledge, some two miles in length, with five or six immense chimneys of ore averaging 20 to 60 feet in thickness. Numerous assays were shown me varying from \$20 to \$500 per ton. Everything indicates another Comstock.

## Dry Lake District.

A Mr. Donham has purchased the mines and mills of Banta & Co. of this district and has

started out with men and provisions to commence operations. Dry Lake is situated about 50 miles East of Victor station on the California Southern and contains a number of small gold ledges.

Murphy & Crandall are said to have sold their carbonate mines at Soda Lake for \$15,000 to San Francisco parties.

## In the San Bernardino Mountains.

The Valley Gold Company of Holcomb valley has struck rich gravel in their new shaft. Mr. A. Del Mar, the managing director, has arrived from England with a view of pushing the works more extensively.

Burnap & McFadden are making arrangements to work some of their numerous ledges in Holcomb valley this summer.

J. B. Osborne's mine and mill has not commenced operations as yet.

A Mr. Phillips and associates have struck some rich pay gravel in Lyne Valley at the depth of 20 feet, but struck too much water for hand work, and is about to make arrangements for pumping apparatus.

It is rumored that a syndicate consisting of Capt. Haley of San Francisco, J. B. Osborne, the well-known mining man, McFadden of Santa Ana, Goucher of Los Angeles, Burnap of Holcomb valley, and several other gentlemen, with a view of tunneling under Holcomb and Bear valleys for the purpose of exploring the great mineral belt known to exist in the mountain range, and for the further purpose of draining and working the extensive gravel beds of Holcomb valley, utilizing the water obtained on desert land in the vicinity.

Bear valley is becoming quite a summer resort, especially for the citizens of San Bernardino and surrounding country. A new hotel is being erected by Knight & Metcalf. There can be no finer climate during the hot summer months.

There is quite an army of prospectors in the mountains and desert, especially along the supposed route to be taken by the Utah railroad. Victor P. O. C.

## Lower Springs Mines.

EDITORS PRESS:—Perhaps the following items may be interesting to your many readers. I will endeavor to give you some information relative to the recent activity in gold quartz matters. Conant & Co. have made several runs upon ore from different ledges here. The quality as well as quantity is satisfactory to all concerned and many hatches from other mines are waiting their turns. Conant & Co. are now prepared to work ores by a dry crusher. They will then roast and work through pans. Their process includes only rebellious ores. They also have a wet crusher. The particles pass over copper plates and over Dodge concentrators. But what we miners are praying for is a first-class pan or pulp-mill in our midst. The reduction works at Redding are six or seven miles from our most valuable ledges. We have a large quantity of low-grade ore in and about our camp, and the grill being very fine will require a pan and settler process in order to work the ore up to a high percentage. This latter process is required at least on ores from the croppings. When we reach the water level the ore will carry a much higher percentage of sulphurets and will require concentrators. The gold ore upon our croppings is very fine and is of a rather free-milling proposition. This pan process works well on all croppings of ore. It matters not if the ore is a little rebellious.

We are waiting patiently for some moneyed party to erect a first-class mill that will save our gold up to the proper per cent; then our miners, with renewed vigor, will pitch in and demonstrate to the public that we have mines here in this partly forgotten camp.

Lower Springs, Shasta Co. I. C. FRICK.

MELBOURNE EXPOSITION.—J. C. Lea, a merchant and mining man of Melbourne, arrived in this city a few days ago on the steamer Alameda. He has come here to examine California methods of quartz mining. He speaks highly of the coming exposition at Melbourne, and says: "If the people of the Pacific Coast could realize with what interest the people of the Colonies look forward to a sight of their exhibit at the great exposition, they would exert themselves to the utmost to make it the best possible. California products have a ready sale now, but the different industries and products of the States and the coast have never been properly brought before the notice of the Australian people, and now that the merchants of San Francisco have an opportunity of presenting their goods in such a manner that it will reach all the people under the Southern Cross they will be lacking the shrewdness and acumen that is conceded to them by the whole world if they do not avail themselves of it."

EIFFEL'S tall iron tower continues to mount toward the sky at Paris, where it is to be one of the most interesting features of the coming exhibition. There are those who predict it will fall before it reaches its full height, but the constructor assures all that there is no danger.

THE new cable put in the Chollar mine, Virginia City, to drive the electric light power, weighs five tons.

## The New Almaden Quicksilver Mines.

From an account of a visit to the New Almaden quicksilver mines, Santa Clara county, published in the San Jose Herald, we condense the following:

Towering mountains clothed in living green rear above us, while at their base flows the clear sparkling mountain stream, upon whose banks the broad shady road winds its way up the canyon. Along the beautiful roadway are scattered many cottages and some elegant homes, all of which are simply buried under a hower of roses and bright flowers of every hue.

The residence of the president, J. B. Randol, is one of the most charming spots that can be found in many a day's journey. The grounds are beautifully arranged and planted to all kinds of fruits, vines and flowers, making it a veritable Garden of Eden.

Many have been told of the bondage and hardships to which the miners and their families are subjected in this mining town. If he slavery to live in one of those rose-borrowed cottages at the nominal sum of \$2 to \$5 a month rental, with free pure mountain water, then enslave us at once. If ever there should be a happy and contented lot of workmen (and they all seem to be), it should be at the Almaden mines.

By the advice of the gatekeeper we first went upon the Hill. The grade is very good but quite steep, and the view that can be had is one of the grandest that can be obtained of Santa Clara valley.

After 30 minutes uphill work we reached what is called English Camp. This is a village of Cornish miners and is a colony as distinct and separate from its surrounding neighbors as if it were planted upon an island in mid ocean. They have their church, school and public hall.

The auditorium is of good size and the stage is large enough to accommodate a good-sized troupe. It is furnished with plenty of comfortable chairs, card-tables and a splendid piano. Here the miners meet of a Sunday or of an evening to while away the hours in reading, chatting and playing various kinds of games.

From here we kept onward and upward to Spanish Camp, which, as its name indicates, is a similar camp to English Camp, except that its population is composed of Spaniards.

We passed on by the old deserted Washington shaft to the American shaft, where we camped.

The officer in charge of the American shaft took charge of us and showed us through his department. In this shaft the water is 400 feet deep and they keep a pump running day and night to keep it to that level. The entire mountain is honeycombed with miles and miles of tunnels, cuts and crosscuts, there being upward of 30 miles of underground work.

There are the Washington, American, Buena Vista, St. Isabel and Randol shafts, all excepting the first being connected by tunnels and underground ways. Some of these shafts are over 2000 feet deep and one of them is 500 feet below the sea level. In this the temperature is very high.

Any lover of mechanics will be well repaid for his trip by visiting the pumping and hoisting works at Buena Vista and Randol shafts. The people of Santa Clara valley will never duly appreciate the work of this company until they go and view the million dollars' worth of machinery and material that have been wagoned up these hills. By the energy and enterprise of this company we have one of the greatest industries of the world brought right to our doors and hundreds of thousands of dollars poured out in our midst every year.

The mining of quicksilver is far from being as profitable as in years past, and it is only by the application of the most improved methods that it is made to pay at present prices.

About the time we had finished our lunch the New Almaden band gathered together and marched to our camping place and treated us to several pieces of as good music as it has been our fortune to listen to for many a day.

We now started down the hill to the reduction works. These are situated at the base of the hill and cover an immense area, and there is enough here to consume an entire day at sight-seeing. All the ore from the various shafts is wagoned to the brow of the hill and then let down to the works, by means of an inclined cable railway, right into the upper story of the building, thereby saving the hauling of it a long distance and also the elevating of it to the top of the works, where it begins its journey in the reduction process.

Here it is that President Randol has made the most radical changes for the benefit of his company. Every appliance of skill and science has been brought into use, and to-day the New Almaden mines are worked on the most scientific and economical system of any mine in the world, with the exception of the labor. This of course costs much more than in the old countries, the wages ranging from \$2.25 to \$4 a day for laborers and averaging over \$3.

We cannot refrain from mentioning some of the changes he has made. For instance, when he went there they used great brick furnaces holding many tons of ore which they would fill, and then seal up the top with masonry and clay. Then a fire would be kept up for four or five days and then they would have to let them cool off to remove the rock from which the quicksilver had been evaporated. This of course was a very slow process, requiring much labor and entailing great loss of time. The

furnaces are now constructed on an altogether different plan. They run day and night, Sunday or Monday. Every hour they dump in a carload of ore at the top and take a load of rock from the bottom. A small stream of pure quicksilver is constantly running into an iron basin, from which it is ladled out into a scoop balanced for 90 pounds, from which it is funneled into an iron flask and tightly sealed.

The novice is very much surprised after viewing the white heat of the furnace and seeing the solid ore thrown in, to go to the hose of the furnace and see the melted silver stream running out, to find that he can hold his hand in the liquid without being burned. The most surprising thing to the stranger is to view all those shafts, pumping engines, hoisting works, hundreds of men employed in mining, teams and cars used in mining and transporting ore from the mines to the furnaces, acres of furnaces and miles of piping, and nothing to show for this great outlay of labor and capital but a tiny stream of bright silver that you would guess you could carry away in a bucket at night.

The appliances are so perfect that they now work as paying ore the old dump piles that at first were thrown away at the mouth of the shafts as worthless stone and dirt.

The managers of these mines have spared no expense to render the working of the mines healthy to their laborers, and to-day no healthier spot can be found than this mining town. The entire smelting works are kept as clean as a housewife's kitchen. They have a perfect system of water works and fire protection. Everything, both inside and out, shows evidence of the executive ability of President Randol and the watchful eye of the superintendent.

### Steam Arastras.

The steam arasstras which Gray & Miller have put up at Gold Hill are attracting much attention and are worthy of careful investigation by other claim-owners in that locality. The capacity of their boiler and engine is 10-horse power. It runs two arasstras with four drags each, also a pump that lifts water from a well 30 feet in depth to a tank which supplies the arasstras. They have attached a novel and effectual mode of crushing ore to their main shaft, which consists of a cam, bolted to a flange which is keyed to the shaft and set so as to operate a vertical bar of railroad iron, held in position by wooden guides and operated in a manner similar to a stamp-mill. All the work has been done by the owners in a neat and workmanlike manner, and it is so arranged that one man can attend to the work with ease while the other is occupied at the mine. This little plant through all its details reflects credit on Gray & Miller, whose capital consisted entirely of ingenuity, pluck and energy. While shipping ore from their mine all they could make was a living, and, not content with that, they took a load of ore to Tom Knot's arastra to see what could be done in the line of working their ore in camp, and, as the cost of working it in an arastra is a mere trifle compared with that of shipping it, and the returns more satisfactory, they determined to try the experiment, and the result is a grand success, because they are making money and are independent. While their little enterprise is regarded with great favor by their fellow prospectors, it is thought that they will soon be classed as bloated bondholders, because their mine is a good one. Knot charged them \$8 for working the little hatch of ore on which they made a test and gave them \$60 as the returns. Now since they have commenced to work ore themselves they don't talk much but look to be very happy and don't seem to care a continental for capitalists.—*Western Liberal, N. M.*

**THE DRY CONCENTRATORS.**—Harry E. Sharp, who has had charge of the machinery in the splendid concentrating mill at Seligman since Mr. Hewitt's departure, stated to a *Eureka Sentinel* reporter that the machinery is all running and doing its work in a very satisfactory manner. He is the master machinist who, under S. R. Krom in New York, constructed the concentrators and other most valuable parts of the machinery, and who, at the special request of Eugene N. Robinson, was sent to Seligman by Mr. Krom to take charge of its erection in the magnificent mill, and to start the machinery in motion. Mr. Sharp said that the plant is perfect, and the machinery is running smoothly and to the entire satisfaction of Mr. Robinson.

**THE Helena Assay Office** has received more gold-dust during the present year than it did up to this date during 1887. At least \$40,000 more has been deposited since January 1st than during corresponding months of last year. The number of deposits for this year are 276, as against 226 for last year. The gold comes principally from Idaho and various sections of Montana.—*Helena Independent.*

The Comstock mines lead the world in the amount of dividends paid. There are 46 mining companies whose shares are at present quoted on American stock exchanges that have severally paid \$1,000,000 or more in dividends. These companies paid in dividends to date over \$230,000,000. Of this amount about a dozen Nevada companies alone have paid over \$120,000,000.

### Gold Ores Containing Lime.

The following article on "Roasting and Chlorination of Gold Ores Containing Lime," was written for the *Engineering and Mining Journal* by J. H. Burfield, M. E.:

It is not my intention to treat the above subject in a general way, but simply will call attention to a few facts which may be of interest.

A sample of concentrates from a large lot was handed me with the following remarks:

Why is it that these concentrates if roasted without salt will only yield about 50 per cent of their contents of gold to chlorine gas?

What is the cause of uneven results if roasted with salt?

Why is it necessary to add salt?

Ferricyanide test is used to ascertain if a "dead roast" has been obtained before any charge is removed from the furnace.

I made analysis of the concentrates, found them to be pure iron pyrites (no arsenic, antimony, copper, lead, zinc, etc.), with 14 per cent of silica and 2 per cent of lime, which latter was present as calc spar.

I roasted two samples in a muffle, one with and the other without salt, treated the roasted material with chlorine gas and bromine water. Only a trace (72 cents) of gold was left in either sample. Roasting with or without salt took the same length of time to obtain a dead roast.

I concluded that salt was superfluous, but the fact that if roasted on the large scale without the addition of salt only 50 per cent of the gold can be obtained remains.

I referred to Kustel, Aaron and other authorities, and found the statement: "Salt must be added if lime or talc is present in the 'gangue.'" Nothing more. The answer to the question, why, is not given.

The fact that even with salt the results were not uniform, and that frequently tailings would contain a large amount of gold, even when the test made with ferricyanide indicated a "dead roast," convinced me of the unreliability of that test if lime is present in the material under treatment. It does not indicate either the presence or absence of sulphate or sulphide of lime; in fact does, therefore, not give the slightest indication if the salt has fulfilled its work for which it is added.

I obtained a sample of tailings containing about \$5 of gold; treated them with an excess of chlorine and also of bromine; no gold could be extracted. Analysis proved the presence of lime either as a sulphate or sulphide, which I did not determine. Ferricyanide indicated the total absence of ferrous salt. I then re-roasted the tailings with salt, determined the chloride of calcium in a portion of it, and when nearly all the lime present was left as a chloride, I again subjected the tailings to chlorine and bromine. Result, only a visible trace of gold was left.

To ascertain therefore to a certainty that a charge is ready for the chlorination tub, it is necessary to determine exactly in what shape the lime remains. Ferricyanide will only indicate the absence of ferrous salt, and if this test is only used the results must be unsatisfactory for reasons given above. Tests made on material worked on a large scale verified the above to my satisfaction.

Text books state that if lime is present it will remain in the roasted material as sulphate of lime. I experimented with chlorine, bromine and sulphate of lime; found reaction very slow indeed.

Added sulphate of lime to the roasted material, treated it with bromine water and chlorine gas; results, tailings as low as without the sulphate of lime. "The day began to dawn."

Roasting in a muffle the charge does not get in contact with the fuel or the gases thereof, the carbonate of lime is converted into sulphate of lime, the heat obtainable in such furnace will not decompose it, it remains as such. It does not interfere in the subsequent treatment, consequently I obtained as good results without salt as with it when I roasted the material in the muffle. It is different if the material is roasted in a reverberatory or cylinder furnace where the charge comes into contact with the fuel or gases thereof. The lime is first converted into a sulphate, but part of the carbon burns at the expense of the oxygen in the sulphate, and the sulphide of calcium is left. And here comes the difficulty. Unless this sulphide is entirely decomposed, no satisfactory results can be expected in the leaching vat. If chlorine or bromine come in contact with sulphide of calcium in presence of water, hydrogen sulphide will be evolved, and this gas in turn will precipitate gold already in solution as sulphide of gold. Kustel states that this makes no difference, as it will be re-dissolved by the excess of the chlorine. I beg leave to differ. It is not re-dissolved by any excess that may be used, but is invariably lost with the tailings unless they are re-roasted and re-treated. This statement I base on several tests made, and also on the fact that such material worked on the large scale gives the same result if treated for 36 hours or 72 hours, with any amount of chlorine gas that will be absorbed.

Some writers claim that the lime remains in the calcic state, the chemistry of which is not plain to me. That it is not the cause of the trouble in the above case, I hardly need mention.

**Resume.** To use the Plattner process on material containing lime, it is necessary that no

sulphide of calcium be present in the material when it enters the leaching vat. To ascertain this to a certainty, see that the lime present is in the shape of chloride, if the roasting is done with salt in a furnace in which the charge comes in contact with the fuel or gases thereof. In case the ore is roasted without coming in contact with the fuel or gases thereof, sulphide of calcium will not be formed. No addition of salt is required, and any test indicating the presence or absence of ferrous salt will answer fully.

I have purposely avoided giving equations, and rehearsing well-known theories I thought superfluous, which will explain many seeming omissions in the above.

### Gold on the Yak.

This is indeed the year of mining discoveries, for almost every day we hear of some wonderful quartz or gravel find, and what is still more strange, all these mysterious whisperings in the ambient air all seem to emanate from the great ters incognita to the north of us. This region of sharp mountain crags and wild torrents which go seething and roaring through deep gorges and over weird cataraets, finally swelling the grand Columbia, has been known since '59 to be rich in golden sands, at which time a party of three prospectors left Bonner's Ferry for the then new Kootenai mines and got lost in the mountains, and finally reached Kootenai through the assistance of friendly Indians. Their tales of placer finds are well remembered by the old miners at Kootenai at that early day, among them Hon. Louis Lee, a resident of this place. In fact they told stories of finding nuggets as large as a hen's egg, and although the men showed three or four nuggets of virgin gold in corroboration, still the miners believed that the gold was obtained from the Sullivan creek placers, now known as Metaline, where Roger Sullivan, Chas. Deitz (recently of Rathdrum, but at present of Colville) and other prospectors obtained such an enormous quantity of gold, \$15,000 or \$20,000 each, within a few weeks. The men tried for some time to get together a party large enough to stand off the Indians and return to the place where they found the gold, but they received no countenance whatever. Winter soon came on, and the people of Kootenai came near starving to death, a 50-pound sack of flour being worth \$100, and small things like rich placers a hundred miles away and the snow 20 feet deep were lost sight of in their great necessity for grub.

In 1884, R. E. Spronk, who was hung in Victoria for the killing of Tom Hammil, went on a prospecting trip up the Yak river, which empties into the Kootenai 65 or 70 miles above Bonner's Ferry, and he informed the writer that he had found a bar on the Yak, 15 miles from its mouth, that was fairly lousy with gold, yet we deemed his statements the empty vaporings of an idle brain. Yet the poor old man, long since in the presence of his God, evidently told the truth and nothing but the truth of the great gold-fields on the Yak.

Later news from this region confirms all former reports as to its inexhaustible stores of the precious metal, both quartz and placer deposits, and those best acquainted with the ground predict a bright future for the last great find in the northeastern part of Kootenai county.

E. G. Pond, a prospector of much experience, and well known in Northern Idaho, was all over the Yak country and speaks in glowing terms of the great mineral wealth of that region; of glittering gold where 10 cents to the pan can be obtained at the grass roots and where are many gravel banks 25 feet high which will average that sum to the pan; in other words, now that miners are going in in sufficient numbers to afford ample protection from roving bands of hostile Indians, there is a great gold field thrown open to the prospector, with millions of dollars of glittering ore in sight. This is in the same region where Dick Fry had a gang of Chinamen at work last fall, and also near where Bill Keeler discovered his big quartz lodes and placer diggings which average \$5 per day to the man.

The Yak is quite a large stream, being about 40 miles long and 200 feet wide at its mouth. It rises in the mountains which separate British Columbia from Idaho, and has plenty of fall for the working of the gravel banks, which are very rich. Bedrock has never been reached, and what can be found there when the gravel is so very rich is only a matter of conjecture.—*Kootenai Courier.*

**CENTRIFUGAL AMALGAMATOR.**—The first *Coeur d'Alene* test of the centrifugal amalgamator was concluded here yesterday, and Mr. Day, who had charge of it, pronounces it an unqualified success. Seven tons of Occident tailings were run, and a sufficient amount of free gold was obtained to demonstrate that the machine will accomplish what is claimed for it. It certainly saves a very large percentage, if not all, of the free gold and the concentrates. To-day a run of 10 tons of tailings from the Treasure Box will be commenced.—*Coeur d'Alene Record.*

ONE of the Baku, Russia, oil wells recently produced 55,000,000 gallons in 115 days. The greater portion was lost, because there was no apparatus to control the output, which flowed away into the river.

### Missonla River Mines.

The New Camp. The Surrounding Country and Bright Prospect of the Mines.

From X. S. Barke, who has recently returned from the new camp on Missonla river, the *Wardner News* gathers the following facts:

At this season of the year the only way to reach the camp is from Horse Plains, on the N. P. R. R. From that station the old Cedar creek trail leads over the mountains to the Missonla river, thence up the river to Cameron's Ferry, on the old Mullan road, where a crossing is made, and then follow up the road easterly along the river about eight miles to the mouth of Spring creek, up which the mines are situated about three miles. The country is broken up by steep mountains, but, unlike the *Coeur d'Alene*, there is but little underbrush or fallen timber, and grass grows in profusion everywhere, making it a paradise for prospectors or hunters.

A little town called Solomon City has been started, now consisting of about a dozen completed and as many more half-finished log houses, one of them containing that inevitable primary enterprise, a saloon. Surrounding the town for a space of probably two miles square, are the mining locations which were discovered last fall. Thus far but little work has been done upon them, still a few have sufficient development to justify the belief that the camp has a brilliant future.

Prominent among these is the Iron King, owned by Phil O'Rourke, Harry Boyer, Frank Tibbals, John Cromie and others, which has a shaft about 50 feet deep showing a large body of sand carbonates, which assay well and are, no doubt, over 20 feet wide. The ledge crops out in places for the entire length of the claim, making it probably the best showing in the camp.

The Keystone, owned by the same parties, and lying about a quarter of a mile north from the Iron King, is a high-grade gray ore, with a tunnel 60 feet long exposing a vein 31 feet wide. Assays from this mine run up into the hundreds.

The Little Pittsburg, lying about a mile south from the Iron King, owned by our townsmen Gove and Crane, L. Davenport and others, has a shaft 100 feet deep showing a vein 2½ feet wide, in which they now have at the bottom of the shaft 20 inches of very high-grade ore; at least 12 inches of this is clean gray copper, assaying over \$350 per ton. They now have about 35 tons of shipping ore on the dumps, and are making arrangements to ship it out at once.

There are numerous other good prospects in the camp, but development is not sufficiently pushed upon them to warrant an opinion as to their extent or richness. Transportation can be had down the river to the N. P. R. R. with a small outlay of money, and the signs are all wrong if this is not a booming camp before fall.

### Australian Mines.

J. C. Lea of Melbourne, who recently arrived in this city, in an interview spoke as follows:

"The alluvial diggings, as you know," said Mr. Lea, "were very rich in Australia, similar to the California placer diggings of '49, but they have been worked out, and now we have to go deeper and tap the quartz ledges underlying the alluvial. So far we have met with success, but have been handicapped to a great extent by the want of requisite machinery. I am going to examine thoroughly into the workings of the quartz mines of this State and report the result of my labors to the Ministers of the Government, that they may recommend the best methods of reducing ore to the mine-owners of the colony."

"All the mines in Victoria are gold mines, and very rich, some of them producing ores worth from five to two hundred ounces to the ton. Of course, we have wildcat mines, the same as you do here, which are floated on our Stock Exchange, but their run is almost over. Their dupes are getting to be very scarce, and the people who invest in mining stocks are becoming cautious."

"The principal mines in Victoria are at Ballarat, Sandhurst and Iron Bar, where shafts have been sunk to the depth of 2000 feet."

"I shall go East to examine into the working of a new amalgamator in use in Pennsylvania. On my return I shall visit the Utah and Colorado mines, and then finish my journey by a visit to the Comstock."

"The large silver mines that were discovered two years ago at Broken Hills, New South Wales, about 160 miles from Sydney, from the present outlook, promise to be some of the best producing mines in the world. The output now, although in its infancy, is about 2000 ounces a month."

**WORK ON MINES STOPPED.**—Judge Sawyer in the United States Circuit Court has granted an injunction to Maria A. Valentine against Samson D. Valentine and others, restraining them from taking any gold bearing or other ore from the Little Pine Tree, Big Oak Tree, Wherry or Golden Eagle mines, situated in Placer county. The complainant is to furnish \$10,000 bonds, and the injunction holds until a further order of the court is made. The complainant is plaintiff in a suit of ejectment at present pending in the United States Circuit Court.

#### Passing Events.

The men in the St. Lawrence mine, Butte, had a very narrow escape on Sunday, and it was a piece of good luck that only one life was lost where such an extended cave occurred. If the telegraphed accounts are correct, the managers had been warned of the dangerous character of the ground, and precautions should have been taken to prevent accident.

It will be noticed from what is said in another column that the MINING AND SCIENTIFIC PRESS is now being printed on a press run by electric power. The use of this power is very rapidly extending in this city, and is found of great convenience.

The excitement concerning the Lower California gold mines appears to be over. It was only local in character, being mainly confined to the southern part of the State.

The mining season in Alaska is reported as backward this year, and thus far very little work has been done. Efforts are being made to sell some of the Alaskan quartz mines in the London market.

A great deal of mining machinery is being made in this city for shipment to the Australian colonies. They are having quite a mining boom over there, and are importing a good many American appliances for working ores.

Work has commenced on the railroad to connect Spokane Falls with Coeur d'Alene.

#### Sowing the Wind and Reaping the Whirlwind.

Judging from the accounts that reach us from Australia, there is likely to occur in that country one of those mining-stock excitements of the kind that in times past so sorely afflicted the Pacific Coast. This Australian craze grows, we take it, out of the silver discoveries lately made in Queensland and perhaps other of the provinces. The papers that advise us of this movement, while affecting to deplore it, seem ready at the same time to justify it in part through the lame excuse that few other openings offer for the profitable investment of capital. Hence the readiness with which multitudes appear ready to embark their means in mining shares, and this, notwithstanding they well know the prices at which these securities are selling, are altogether fictitious, and that a grand collapse must eventually ensue.

It is, in fact, but a repetition of what has so often happened here in California, only that there has usually been with us something more substantial on which to base our ventures than these colonists have yet been able to point to. There was something so royal in the discoveries made on the Comstock and they hurried so suddenly on our vision that we could, for a time, hardly help being dazzled with their glamour, their phenomenal output of bullion at the start having been calculated to heighten an undue confidence in the future of these mines.

Then, too, the Californians were novices in this kind of business. They knew at the outset nothing about its allurements and dangers—nothing about the inside plotters and the outside claquere—the artful stock-johner and the wily manipulator, the wash sales and the lying reports. They had all this to learn by experience, and it must be confessed that it took them a good while to reach such an understanding of it as has since led to a general abandonment of this perilous field of speculation.

Having now seen the "elephant" and from actual inspection gained a realizing sense of the size and the crushing powers of the brute, it ought not to seem impertinent on our part if we tender our neighbors in the land of the kangaroo and the boomerang a bit of advice, founded on our experience in this most reprehensible and dangerous style of gambling. To begin then, let us tell them that the two States of California and Nevada have, in our opinion, suffered more from these stock operations than from any other one thing, intemperance alone excepted. We might even aggregate the losses that have come of several notable evils, such as drouths, floods, fruit pests and blighted vineyards, and scarcely would their sum total equal the money values that have been swallowed up in this class of transactions.

Thus much for the pecuniary aspect of the case: If we take account of the moral and social mischiefs directly traceable to this cause, we shall find ourselves confronted by an evil the magnitude of which baffles comprehension—an evil, too, that cannot, like money losses, be palliated or repaired. If the men who are responsible for and have profited by these raids on the community at large were ever so willing and even desirous of making amends, they could not do so because they could not bring back the suicide to life, reinstate the fallen, cure the incurably insane or replace the lost earnings of the countless poor. This is all on record and cannot in any jot or tittle ever be altered or effaced! That it is so is a fearful thing to contemplate, and ought to cause one meditating an indiscriminate robbery of this kind to hesitate before doing that which can never be undone and for which he can make no reparation. This must, we opine, be the unpardonable sin we read of, because it is a sin that can never be atoned for.

If, now, these colonial peoples, warned by our experience, would take care to avoid our mistakes, what of tribulation, disappointment and loss, to say nothing of soul ruin and social wreckage, might they not escape! Like causes produce like effects. As disaster has come to us, so will disaster come to them if they follow in our footsteps. To persist in the course they seem to have entered upon is but to sow the wind with the certainty that they must reap the whirlwind. These Australians have valuable deposits of the precious metals and many of them. Let them be persuaded to avoid stock-gambling and work these deposits in a

sensible, business-like way—in such a way that, instead of being a curse, they will prove a blessing to their country.

Addressing these words of caution to communities so far away does not imply that our own people have been so thoroughly cured of the evil here inveighed against as to no longer require any word of admonition or warning. Fooled and fleeced as they have been, let hut another honanza be uncovered on the Comstock and the inevitable craze ensue, and there is reason to fear a good many of them would betake themselves again to this miserable business, submitting to be shorn just as clearly and just as cruelly as ever before. Let a market be made for the uncaged wildcat, and we shall see these covetous and credulous people ready to hazard their means in the same foolish and reckless manner as of old—that is, such of them as happen to have any means left. Like the votaries of the gaming-table, the habits of the mining hourse are apt to become so infatuated with the business that hut rarely do they ever get quite cured of their love for it.

#### Protecting and Preserving Piles.

On this coast, where the ravages of the teredo and limnoria are so destructive to piles and other wood used in salt water, numerous inventions have been tested as a means of prevention. The question is a very important one, as in some places the "life" of a pile is not more than three years, when it has to be replaced, entailing great expense. The latest inventions to protect and preserve piles are those just patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Charles C. Lane of this city, who has assigned his rights to John H. Boalt. One of the inventions consists in splitting the pile substantially in the direction of its length and throughout that portion which is to be exposed to the attack of marine insects, leaving the remaining or top portion, where strength is required, unsplit, and in treating the split portion of the pile with a suitable protecting or antiseptic compound. The compound, entering the splits or cuts, fills them up and permeates the substance of the pile. The teredo will not cross the cut or splits, and can only work in the solid portion, which is so thin it cannot carry on its operations; nor can it come to maturity or even live in the narrow substance between the piles.

The other invention consists essentially in incasing or covering the immersed surface of a pile with a sheathing of wood which has been previously prepared by pricking or puncturing it, by subjecting it then to a bath of some light preservative or protective material whereby its open pores are caused to absorb said material, and by finally sealing the punctures or openings in it with a heavier material. The exposed surface of the wood is first covered with a protective material or coating, such as asphaltum and sand, then securing over said coating the sheathing of wood prepared as described, and then covering this sheathing with an outer coating of material similar to that forming the inner coating. The advantages of this application are that the inventor attains a preservative and resistant sheathing or jacket for the pile without weakening the pile itself, as would be the case if the punctures or holes were made directly in the pile in order to apply this treatment. The prepared sheathing need not be applied direct, but in some cases a box may be made of the sheathing so it may be fitted over the pile, and the space filled in with proper protecting material.

THE Carson Mint is now turning out monthly, in fine bars, silver to the amount of 160,000 standard ounces, and about 10,000 ounces of gold. The gold hugs in the East, and other enemies of silver, can no longer manufacture capital by the cry that the Comstock bullion is transported past the doors of the Mint for reduction at private smelting works in San Francisco, for the institution is now running to its fullest capacity. So great has been the increase of deposits that it has been necessary to erect nitric acid works, which will increase the refining capacity about 60,000 ounces per month.

THE coinage at the Mint in this city during May amounted to \$1,613,000. Of this all but \$208,000 was in gold—\$1,360,000 in double-eagles and \$45,000 in \$5 pieces. Of the silver, \$150,000 was in standard dollars and \$58,000 in quarters.

#### May Dividends.

The dividends disbursed during the month of May last by our various local incorporations, mining, fiscal, industrial and otherwise, reached a total of \$662,670, against \$422,990 for the corresponding month of the preceding year. Of this amount, \$108,000 came from the Con. California and Virginia mine, being over 16 per cent of the entire sum paid out. The Hale and Norcross, another Comstock company, divided among its shareholders \$56,000, being the third largest dividend made, and the first declared by this company for the past 17 years.

Although net earnings have been so long intermitted, the work of searching after pay ore has been kept up in the Hale and Norcross quite steadily during all these years, current expenses having been met by assessments levied on the shareholders. That it should at last be making some net returns is a noteworthy event, as giving hope that other of these Comstock mines in which assessments have been taken on the chronic form may yet some day bring to the patient and long-suffering shareholders a like agreeable surprise. These two are the only mines on the Comstock that are at present paying dividends.

But while so few of these mines are just now in honanza, affairs over there would seem to be in a tolerably healthful condition. If so few of the companies are making any net profits, quite a number are paying their way under heavy outlays for development, the assessments levied by each are any thing as onerous now as formerly. But the most encouraging feature in connection with the business of mining in that region is the extent to which stock gambling has subsided, giving way to more careful management and economical methods of working. By reason of this the situation along the entire Comstock range ought to be considered satisfactory, as compared with some epochs in its past history.

That there still exist minor abuses in connection with the conduct of these mines there is no question. But for these the shareholders in the several companies ought to be able to find correctives. But in no event can this class of evils affect the general public as do these speculative movements, the last of which, let us hope, has been seen on this coast. Looking back a few years it really seems incredible the extent to which nearly all classes of people were carried away by these stock excitements. They amounted to a species of insanity.

Just think of it! The Comstock mines dealt in on the stock-board selling in January, 1875, at a valuation of \$262,000,000—in January, 1881, at a valuation of less than \$7,000,000! a shrinkage of more than \$255,000,000 in the course of six years; a large percentage of this loss having been incurred by people in moderate circumstances. No wonder the masses are poor; nor is it at all a wonder that a few men in the community are excessively rich. Let there be made no more millionaires by this cruel and senseless process.

#### Foundry Notes.

The big steel casting of the stern-post of the cruiser San Francisco has been removed from its mold at the Pacific Rolling Mills and pronounced perfect by Lieutenant Gilmore, the Government Inspector. In about a month from now the ram for this cruiser will be cast at these mills. The stern-post just completed is the largest casting of the kind ever made in America.

It is expected that the cruiser Charleston, now being completed at the Union Iron Works, will be ready for launching by the 4th of July.

The Risdon Iron Works are building a very large quartz mill for the Ilex gold mine, Calaveras county.

The Joshua Hendy Machine Works are turning out just now an unusual number of "Challenge" ore feeders.

The Fulton foundry has on hand a number of compound marine engines for use in coasting vessels.

Parke & Lacy are having built considerable mining machinery for Australia. Among this are several Dodge crushers and pulverizers.

PARTIES who have returned to Benton, M. T., from Sweet Grass, on the reservation hills, bring examples of fine gold from placers discovered there. They report an abundance of the precious metal. Quite a stampede has commenced to the hills.

**"Hazleton" Tripod Boilers.**

We herewith present an illustration of the special form of the "Hazleton" tripod boilers, built by the "Hazleton" Tripod Boiler Co. of Chicago, Ill., for which the Joshua Hendy machine works, of Nos. 39 to 51 Fremont street, this city, are the agents for the Pacific States. These boilers develop in their construction several novel features, and it is claimed that their operation has fairly demonstrated that they are practically the safest and most economical steam generators yet devised for the following reasons, viz.:

The central column of these boilers being vertical, as will be observed from the cut, permits

area of these parts naturally performs the duty of steam dryers. In other forms of boilers the temperature of the steam is due to the pressure carried, whereas in these the steam is hotter than the temperature, due to the pressure as it passes through all of the tubes above the water line before leaving the boilers.

The gain from this important factor of construction is obviously great, as the steam is thereby rendered dryer and hotter, thus enabling the connected engines to cut off at shorter stroke by reason of the greater expansion of this dry steam.

The large number of these boilers which have been placed in successful operation in the Eastern, Middle and Southern States of America has

**A Mine Accident.**

At the St. Lawrence mine, Butte, M. T., a serious accident happened on Sunday last. While the miners were gathered at the station to go to the surface, a heavy cave occurred, extending some 300 feet in length. It is said that experienced miners have regarded the place as dangerous, and a number had quit work and refused to work there. The men who were at work on the 200-foot level at the time of the accident had all arrived at the shaft to be drawn up, with the exception of four on that shift who had been delayed in placing some drills. The names of the victims in the cave-in are James Gooley, Michael Sullivan, Patrick O'Neil,

their long imprisonment. The body of Tim Harrington was recovered Monday evening. He was caught in the drift and his life crushed out when the cave occurred. There will be a thorough investigation of the cause of the accident.

**Quartz Mining Activity.**

The increased activity in quartz mining in this State and on this coast is very noticeable this spring. From all sides come accounts of the development work going on, the relocating and reworking of idle claims, increased work on old and opening of new ones. In California mining is conducted on an entirely different basis from what it was 20 years ago. The system is no longer "top-heavy." Fancy salaries are not paid to kid-gloved superintendents or other officers. The employees are now all expected to earn their salaries, and incompetent men are soon dropped. Affairs are conducted on business principles and economy is the order of the day.

We have learned, too, how to work our mines and treat our ores much better than we did. Mines are now worked at a profit that produce only ore that a decade since would not pay expenses. Means of transportation are better, labor more available and steadier, and supplies more easily procured. All the conditions are more favorable, and, moreover, people do not in these days expect to make their fortunes in a month or so. They are satisfied with smaller profits and a regular output. As a general thing the business is paying well.

The manufacturers of mining machinery and appliances in this city report an increased demand for their goods. As an instance, it may be mentioned that the sales of the "Challenge" ore-feeders have covered a larger number during the past month than in the same period since originally devised. The foundries are all busy and considerable mining machinery is being built and sold.

**The Lick Observatory.**

THE MINING AND SCIENTIFIC PRESS of next week will contain a complete and detailed description of the Lick Observatory, with some 40 engravings. The number has been some time in preparation, and will be found useful for reference and of general interest as well. The Observatory has been informally transferred to the Regents of the University and the further ceremonies of acceptance will take place at Berkeley on Commencement day.

The Observatory is not yet ready to receive visitors at night, as the Lick trustees are still engaged in work upon the elevating floor of the dome. When this work is completed, which will be shortly, visitors will be admitted according to the terms of the accompanying circular:

The Observatory buildings will be open to visitors during office hours every day in the year. Upon their arrival visitors will please go at once to the visitors' room and register their names. An hour or so can be profitably occupied in viewing the various instruments, and the rest of the stay can be well spent in walks to the various reservoirs, from which magnificent views of the surrounding country can be had. At least an hour and a half of daylight should be allowed for the drive from the summit to Smith creek. There are no hotel accommodations at the summit.

Within a few weeks visitors will be received at the Observatory to look through the great telescope every Saturday night between the hours of 7 and 10, and at these times only. Whenever the work of the Observatory will allow, other telescopes will also be put at the disposition of visitors on Saturdays between the same hours (only). At 10 P. M. the Observatory will be closed to visitors, who should provide their own conveyance to Smith creek, as there is no way of lodging them on the mountain. It is expected that by setting apart these times for visitors (which allow freer access to the Lick Observatory than is allowed to any other observatory in the world) that all interested may be able to arrange their visits in conformity to them; and that the remaining hours of the week will be kept entirely uninterrupted, in order that the astronomers may do the work upon which the reputation and the good name of the Observatory entirely depends.

EDWARD S. HOLDEN, Director.

Due notice will be given when the Observatory is ready to receive visitors at night.

THE Crown Point mine in the Comstock for the last year produced 9026 tons of ore that milled \$10.74 per ton. There were also 810 tons which yielded \$13.53 per ton.

HAZLETON BOILER WITH BRICK WORK.

OUTLINE AND GROUND PLAN WITHOUT BRICK WORK.

all of the accumulating sediment in the water to be precipitated to the bottom of the column, by its own gravity, from whence it can be readily removed. It will further be noted that the radial arms are short, being only 24 to 36 inches in length, through which the circulation is necessarily exceedingly rapid. These radial arms are regular boiler tubes, having one of each of the ends closed while their other ends are expanded in aperture reamed in the central column. There can be no pull nor strain on the joints, as the tubes are made fast only at one of their ends, and can, therefore, expand freely upon the application of heat; and it will further be observed that the central column is also free to expand when subjected to the same action.

Another peculiarity will be found in the fact that the entire heat, generated from the burning fuel, is disseminated throughout the boilers, the whole interior surfaces of which are heating surfaces.

The large domes which are placed at the water line increase the water area and the steam is given off free from water. The parts of the boilers above the water line form steam spaces, and a large portion of the superficial

proven that by their use a saving of from 20 to 30 per cent in the consumption of fuel can be effected over any style of boilers yet introduced, and at any rate the manufacturers and their agents are prepared to guarantee this percentage of saving.

We deem it important to direct attention to the economy of space which can be secured in the placement of these boilers, and which is as follows: A boiler of 300-horse power requires a ground or floor space of 13 feet in diameter, or an area of say 133 square feet, and one of 500 horse power a space 17 feet in diameter, equivalent to an area of 227 square feet.

The manufacturer's agents have informed us that the first boiler of this style, built by Mr. M. W. Hazleton, the deviser, is now in constant operation at Eleventh street and East river, New York City, and several others of the same form have been added to the plant and been in use night and day during the last seven years, and no repairs have been required since having been placed in position.

DURING May there were 1691 flasks of quicksilver, value \$64,437, exported from this port.

and Tim Harrington. The men at the shaft were knocked down by the concussion and all were blinded by the dust. The mine connects with the Anaconda, which joins the St. Lawrence on the west. From the Anaconda side the imprisoned men were heard knocking on the air pipe, and the work of rescue was commenced at once. A large force of men were engaged in the work, and they changed off with a new set every few minutes. The work was necessarily slow as they were making an upraise through the caved ground, which kept settling and falling through almost like quicksand. When within about 50 feet of the drift in which the men were imprisoned they could hear the rapping of a hammer on the rock, and from a signal given it was made known that three men were there.

James Gooley, Michael Sullivan and Patrick O'Neill, three of the men imprisoned in the cave were recovered after 17 hours of constant work by foreman Michael Carroll and relays of rescuers. They had been communicated with by the rescuing party and furnished with whiskey through a pipe. None were the worse for

## MECHANICAL PROGRESS.

## Wood vs. Steel.

Which is the Stronger in Proportion to Weight—A Simple and Interesting Experiment.

The relative weights of wood and steel in proportion to their strength is a matter which probably not one out of 100 readers has ever had occasion to investigate. If the conundrum were propounded: "Which is the stronger—wood or steel?" ninety-nine out of a hundred would be likely to answer that steel possesses greater strength in proportion to weight than does wood. Experiments have recently been made in Ohio which show that wood weighing only half as much as steel will, when put under pressure, stand a greater strain than steel.

Take a piece of hard wood, ash for instance, and a bar of steel of the same length, and weighing twice as much as the wood, and subject both to the same breaking strain, the steel bar will be very much bent before the wood is thrown out of line.

This, says *Farm and Field*, illustrates an important fact which should be known to every farmer and mechanic, especially since there seems to be a disposition on the part of some manufacturers to change from wood to steel and iron. It was the pleasure of a representative of the paper named, while in Akron, Ohio, a short time since, to witness an experiment proving the above-mentioned fact.

A piece of ash, such as is used in the Buckeye machine, was placed in a clamp along with a piece of steel of equal length, the same as is used in all steel binders. The steel weighed just twice as much as the wood, and yet the steel invariably yielded and bent as the pressure was brought down. The wood was scarcely out of line, and when the clamp was removed it sprung back to its original shape. Not so with the steel. It not only bent under the pressure of the clamp, but remained bent when the clamp was taken off.

This, continues *Farm and Field*, is a clear illustration of the difference between wood and steel-frame binders. When an all-steel machine is brought into sharp contact with some unyielding obstacle, its frame is liable to spring, and when once sprung its usefulness is at an end. It cannot be straightened without resort to the shop for repairs. A wood frame is not thus affected. If bent under a violent strain, it at once springs back to its original shape. At the first glance it would seem that a steel binder is lighter than a wood frame, and that it possesses greater strength. But it is an instance in which appearances are deceptive. A piece of steel one foot long and a half inch square, weighs double as much as a piece of seasoned ash one foot long and 1½ inches square. In other words the steel, in proportion to bulk, is 1½ times as heavy as the wood. A steel frame of a machine which is one-fifteenth as large as a wood frame, weighs exactly the same as the wood. But even with this difference in size, the wood has four times the strength. These are simple problems which every farmer can solve for himself. He need not accept the word of any man whose interests would be subserved by having him believe one way or the other. Make the test yourself, and when an agent comes to you with a denial of this proposition, you can talk intelligently from personal knowledge.

## History and Manufacture of Ramrods.

Muskets were in use nearly a century before this country was discovered. The chargers were rammed down with wooden ramrods. It was considered a great step in warfare when, under Napoleon Bonaparte, iron ramrods were substituted for those of wood. The objection made to iron, which did not at that time seem fanciful, was that it was liable to strike fire and ignite the cartridge in driving it home. But daring investigators decided that this objection was more in the mind than in the matter. It was decided that it was not substantial, and iron prevailed. But even iron could be improved upon. The rods bent easily. Then the rods were made lighter and of steel, to which was welded a soft iron head. Soon after the advent of the Springfield rifle, the iron head was abandoned and the finely tempered steel ramrod, of the government pattern, which was used during the civil war, was adopted. Three quarters of a century have improved this article, from being a rude affair to being an exhibit of fine workmanship. Another quarter of a century, and further improvements may have ended its existence.

A good ramrod is really a work of art in design, and of wonderful skill in manufacture. The stock of each one is carefully weighed and cut from the bar. The head and the swell beneath it are then blocked out under the trip-hammer, and the long, slim, tapering rod is then drawn out with a pair of dies, which for the most part are nearly flat, under the trip hammer, which strikes about 400 blows per minute. There is no cessation of the stroke, for the heater has a hot one ready to be worked on as soon as the one which is being worked is finished. The hammer strikes the last blow on the finished one, and the next blow strikes the hot one. With a hammer running as this sped, the celerity, the accuracy and the judgment exercised are elements of a skill than which I know no greater.

After the rods are drawn down square, they

might be finished by rounding with a common pair of rounding and straightening dies, keyed in the usual manner; but the length is so great as to make it hazardous in practice, and other means have been adopted. These appear in the form of jumper dies, used under the trip-hammer. The least nick in the side of the finished ramrod will cause it to be condemned, for every rod is ground to the most accurate measurements.—*American Machinist*.

**COMPOSITION AND CHARACTER OF DELTA METAL.**—This metal, says an English scientific journal, is formed by the introduction of a small percentage of iron into copper-zinc alloys. Nearly a quarter of a century ago, Aich and Beren Rosthorn of Vienna perceived the high character possessed by this compound, both as regards strength and tenacity, but the matter remained in abeyance till recently. Its special features are the inability of rust to corrode it and the magnetic needle to become attracted by the metal. It is now placed on the market as an article of commerce. The specific gravity of Delta metal is 8.4—that is to say, it differs but little in weight from copper, while its melting point is 1800°. In color the alloy resembles gold or corrosion. The cost of which it can be produced is that of the best brass. The alloy can be worked both hot and cold; be rolled, stamped, cast, forged or brazed with equal facility. The castings are particularly sound and free from blow-holes—a frequent source of loss and annoyance with those made in brass—while possessing, it has been computed, three times the strength of brass casting. It can be used for parts of rifles, guns, torpedoes, tools for gunpowder mills, parts of bicycles, gongs, etc., formerly made of steel; in pump-work to supersede brass, and extensively in ship's fittings; in chemical manufactures, where other metals would rapidly corrode; in shutters, for bolts and nuts; proellers, anchors, cranks, cog-wheels; in harness fittings, spoons, forks, cups, fenders, vases and candelabra, and a large variety of other goods where handsome appearance is a desideratum. It therefore should have a great future before it in this country.

**LIFE OF IRON PIPES.**—The wear by rust in uncoated cast-iron pipes exposed to the action of clean, fresh water on both sides is not more than one-eighth of an inch in three generations. With the present method of protecting such pipes with asphaltum, the life of the ordinary cast-iron pipe used in building construction may be greatly prolonged. Indeed, even an ordinary coating of coal-tar pitch, when properly applied, is sufficient to add at least a score or two of years to its durability. The life of a soil pipe, even when quite thin and uncoated, has been found by experience to be so great that it is not unreasonable to suppose that the greasy matter contained in sewage serves to coat and protect the iron from the corrosive action of the water and the acid components of the sewage. The defects and leakages more generally met with in such pipes are caused by the defective manner in which the joints are made, and improper placing and securing. Wrought-iron pipe for water or gas mains does not seem to have the durability which cast iron possesses. Why this is so, nobody can probably explain. For service pipe, of course, wrought iron is preferable in case lead is not used, but the wrought iron should be galvanized to protect it from corrosion.

**ALLOYS FOR MAKING SPECIAL GRADES OF IRON.**—E. W. L. Biermann, of Hanover, Germany, has for many years made a specialty of the production of some rare alloys and metals for producing special grades of iron, steel and bronze. He makes ferrotungsten cast in ingots, running from 20 to 57 per cent; ferro-silicon-manganese, ferrotungsten-manganese, 5 to 10 per cent; ferro-aluminum, 5 to 13 per cent; ferro-silicon, 5 to 45 per cent; ferrochrome, 10 per cent; ferromolybdenum, ferrophosphorus, and 5 per cent ferrotitanium. He produces also manganese copper and manganese bronze, silicon copper and silicon bronze, alloys of tungsten, cobalt, nickel and phosphorus, with copper, aluminum, bronze, silicon-manganese bronze, nickel bronze and phosphorus bronze. He manufactures Wood's metal, having a fusing point of 73° C., and Rose's metal with 94° C. as the melting point.

**HORIZONTAL AND VERTICAL ENGINES.**—No other than the horizontal engine for screwships was used for many years in war ships on account of the necessity for complete protection, and the efficiency of the machinery arrangements was thus much reduced. Within the last few years, however, in large battle ships and some others, it has been found possible to sufficiently protect the cylinders of vertical engines from danger by projectiles, and this type of engine has in all such cases invariably been fitted. The advantage gained by the use of the vertical engine instead of the horizontal are very considerable, the engine working far more smoothly, wearing more evenly, and all parts being much more accessible for examination.

**STEAM POWER OF DIFFERENT COUNTRIES.**—Recent statistics of the amount of steam-power in use in different parts of the world make it appear that the United States consumes more power from stationary engines than any other country, the figure being placed at 7,500,000 horse-power, as against only 7,000,000 horse-power in England, 4,500,000 in Germany, 3,000,000 in France, and 1,500,000 in Austria.

## SCIENTIFIC PROGRESS.

## Messmerism or Hypnotism—Which?

A great deal of skilled time and attention is being spent upon the study of hypnotism, and the more careful the investigation, the greater the interest that is awakened, and the more men of first-rate position take a part in the inquiry.

Only a few years ago the so-called hypnotic phenomena were looked at askance, and those who dealt with it regarded as more or less knavish and silly. The late Dr. Esard, who believed in the reality and scientific value of trance-phenomena, was publicly insulted by English physicians for venturing to demonstrate his views, and the N. Y. Academy of Medicine subsequently made one of his insults, Dr. J. Oribton Browne, an honorary member. The fact that any man of scientific reputation was known to feel an interest in matters associated with "mesmerism" or "animal magnetism" was sufficient to make him an object of suspicion, and injure his good standing among his fellow-scientists, and the whole matter was left, for the most part, to charlatans and pretenders, whether they called themselves magnetic healers, Christian scientists, or any other fanciful name. But science, in the remarkable progress attained of late, has advanced so far upon certain lines, that it has been hardly possible to proceed further without entering upon the forbidden fields. The old sign-boards against trespassing have been taken down. For "mesmerism" (that verbal scare crow) has been substituted "hypnotism," which is mesmerism with a new Greek name, which name has had a wonderfully legitimizing effect, while "animal magnetism," that once flouted idea, has been proven to be an existent fact by methods as accurate as those adopted by Faraday or Edison.

Periodicals making a specialty of the subject are now published in France, Germany and England. A catalogue of the recent literature of hypnotism and related phenomena, compiled by Max Dessoir, occupies nine octavo pages.

Mesmer, no doubt, was an empiric; but he nevertheless, in spite of his exaggerated methods and bombastic nonsense, got at the truth. Dodge it, if you please, by hiding under the new name, yet the fact still remains that the phenomena of hypnotism are identical with those of mesmerism, and it is equally true that all the experiments of Dr. Luys, which appear in the translation by Prof. Castegnier, were made years and years ago, and that similar experiments are recorded in the works of Reichenbach, who invented, as an explanation of these phenomena or effects, what he called "od" or "odic" force.—*Medical Classics*.

**ARTIFICIAL DIAMONDS.**—Prof. Simmler brings forward the somewhat plausible theory that the basis of diamond formation is liquid or liquefied carbonic acid. Indeed, facts observed by different savants tend to show, it is said, the presence of this agent in the coating of the most valuable gems. Upon the bursting of such crystals there are often found to occur two liquids in the cavities, the one behaving like water, the other like liquid carbonic acid. On one occasion, indeed, it was observed that the liquid in a quartz crystal which was dashed to pieces scattered its contents around with a great noise, burning holes in the handkerchief wound around the hands of the experimenter. The acid contents had itself disappeared. Under these circumstances M. Simmler argues that if carbon be soluble in liquid carbonic acid, it would then only be necessary to subject the solvent to slow evaporation. The carbon would thereby be deposited, and, by taking proper care, assume crystalline forms, and in evaporation quickly the so-called black diamond, which, in the state of powder, is much used for polishing, the colorless diamond might be produced. Though the liquid in question has never been subjected to a chemical analysis, the formation of liquid carbonic acid in the interior of our globe may, it is admitted, be considered as highly probable.

**MORE OF PHOTOGRAPHING IN COLORS.**—The latest improvement in photography, as described by the Philadelphia *Inquirer*, is a process by which colors as well as objects may be photographed. By the use of three plates instead of one, three negatives are taken on plates specially prepared. These are exposed in a triple camera. In front of them "light-filters" are set, carefully adjusted, so as to admit to each plate the amount of light just requisite to impress on the negative the picture of such a color as will, when combined with the other two colored negatives, reproduce the desired color and light and shade of the object photographed. In a recent lecture Mr. Ives, the inventor, exhibited a photograph of a landscape, in which the different shades of green in foliage and the varied colors of sky, house and barn, with the rich orange of autumn leaves, were perfectly portrayed. This will work a revolution even in photo-engraving, while the composite photographic process, producing the fine lines of wood engraving, which the gelatinized zinc plate was not able to furnish, now rivals hand-work so accurately that the difference is not discernible except to the expert.

**THE NOSE AND THE BRAIN.**—Dr. Guye of Amsterdam has been making a study of nasal maladies and their effect on the brain. He

finds that a diseased nose is often the cause of inattentiveness and dullness in children. A dull boy became quick to learn after certain tumors had been taken from the nose, and a man who had been troubled with vertigo and buzzing in the ears for 12 years, found mental labor easy after a similar operation. In a third case a medical student was similarly relieved. Dr. Guye supposes that these nasal troubles affect the brain by preventing the cerebral lymph from circulating freely.

**NATURE FULL OF PARADOXES.**—It is the general understanding of scientists that warm air is in a measure a vacuum, and that cold air rushes into these vacuums, and, as it warms, it descends. But somebody has lately said that the cause of our Western cyclones is the warm air moving along the Equator, and through the Gulf of Mexico, and up the Mississippi Valley to meet the cold air of the North. This does not agree with the old scientific theory that cold air moves in the direction of the nearest warm air. When the mercury is away down below zero outdoors and 60° or 70° above in our room, the air of the warm room rushes up the chimney with great force to meet the cold air outside. At the same time that this process is going on, if we raise our window an inch, a strong current of the cold outside air will rush in, exactly contrary to what is going on in the chimney. The world of nature seems to be full of paradoxes. If we stand before a mirror, we see our right side on the left, and the left side on the right. Now when we see ourselves thus, why don't we see ourselves head down and our feet upward. Why is there this difference between the perpendicular and the horizontal?—*Germantown Telegraph*.

**EXPLOSIONS GENERATED BY SAWDUST.**—Enormous deposits of sawdust in the Ottawa river are making trouble, not only threatening to close navigation, but, owing to explosions of gas generated from decomposition, vessels are sometimes thrown into the air. Mr. Arnold, chief mechanical engineer of the Public Works Department at Ottawa, speaks of seeing as many as three explosions of this sort in a single week. He was surprised that there had not been some loss of life on this account. A difficulty was likewise experienced by the steamboats on the Ottawa in keeping their pumps in order, owing to the sawdust getting into the machinery. Sawdust could be dredged out and lowered into barges and got rid of by being dumped into deep water. Sawdust, however, would have to be carried on shore and either dried or burned, or thrown into deep gullies.

**MAGNETISM OF METALS.**—"Shelford Bidwell (Royal Society, March 1st), is continuing his admirable researches on the changes produced by magnetism in the lineal dimensions of the different magnetic metals," says *Nature*. "He finds that iron, which first expands with the magnetizing force, soon reaches a maximum point, whence it contracts until it attains its original length; but on still further increasing the magnetizing force it contracts until it apparently reaches a minimum point, beyond which his means have not enabled him to proceed. Bismuth appears to continually expand, nickel to continually contract, while cobalt contracts, reaches a minimum point and then expands, approaching its original length. Manganese steel was unaffected. His apparatus was so perfect and sensitive that he could read a variation of one hundred thousandth of a millimeter."

**CONVERTING ELECTRICITY INTO HEAT.**—It is announced that several patents have recently been issued to a Baltimore electrician covering improved methods and apparatus for heating by electricity. The inventor, it is claimed, has made a radically new discovery in the method of converting electricity into heat, whereby the losses incident to all previous efforts in that direction have been practically overcome. By this system it is claimed that dwellings and other buildings can be supplied with heat from central generators by the same conductors which now supply them with incandescent electric lights, and at a cost considerably less than the method now in vogue.

**CHEMICALLY PURE ZINC BEING MADE IN NORTH CAROLINA.**—The Piedmont Reduction Works are in successful operation. Capt. Crolemlire, the energetic superintendent, is making chemically pure zinc. We are informed that this is the first and only place in the world at which this has been done. Capt. Crolemlire discovered the process and has it patented here and in Europe. He has been offered \$100,000 within a few days for his patent for the United States excepting North Carolina, and has declined. These works and their practically successful working are of inestimable value to the world.—*Thomasville (N. C.) Gazette*.

**A NEW PROPERTY IN SULPHUR.**—In its ordinary condition, sulphur is one of the best insulators, i. e., one of the worst conductors known. M. Duter, in some experiments at the Sorbonne Laboratory, has, however, shown that when raised to its boiling point—about 836° F.—sulphur is capable of transmitting an appreciable current of electricity. With electrodes of gold, connected to a battery of Leyden jars, a current was obtained having the mean value of 1-8000 amperes.

**WHAT IS LISLE THREAD?**—Lisle thread is a fabric that is woven from ordinary linen thread that has been first of all twisted.

## USEFUL INFORMATION.

## Cases of Spontaneous Combustion.

In a factory in New Jersey, where oiled stock for planes was operated on by boring, planing and mortising machines, causing shavings and fine particles of wood, which were saturated with linseed oil, to collect on the floors, it was noticed that a great increase in the temperature took place when the sweepings, which had been moistened by sprinkling, were collected in a pile. On a subsequent occasion it was found that a barrel of shavings and chips from the boring and mortising machines were so hot as to be almost ready to ignite. Another barrel contained shavings made in planing oiled stocks. On these being moistened with water they soon began to heat, and the temperature continued to rise until the next day, when it was found that the shavings began to char. The barrel was covered with a metal plate until the next day, when, on being disturbed, the mass burst into flame.

In a manufactory of plane-bits a sponge had been used to transfer the water by capillary attraction from a water-box to an emery-wheel on which the bits were ground. The sponge wiped off the fine steel particles from the wheel, and they were collected in the sponge and kept constantly wet. The sponge was finally laid aside, and after a week or ten days it was discovered that the mass was spontaneously ignited, and if it had not been for its timely discovery another mysterious fire might have resulted.

Some years since a gentleman was experimenting in coloring Southern moss for decorative purposes. In one of his experiments he used a very thin paint, or varnish, but slightly colored with a pigment. He dipped the moss in the mixture and then squeezed out as much as possible by hand. The result not proving satisfactory, he threw the moss in a box and placed it in a closet. A few days after the odor of something burning led to the discovery that the moss was charred and almost ready to ignite.

In the manufacture of a cement or putty composed of whiting and boiled linseed oil, which, after being ground in a mill, was put in barrels, a fire was discovered under one of the barrels standing on end. The floor was partially burned through when the discovery was made. In grinding the oil the mass became warm from the friction, and a small part of the oil had leaked through the common barrel while in this warm state. It was discovered in time to prevent much damage.

A number of hales of sea-island cotton stored in a warehouse in New Jersey were found to be on fire. When the fire was extinguished at one spot it would start at another. The cotton had been ginned on a roller gin, which, in cracking a portion of the seed, had caused the oil in the seed to become mixed with the cotton, and the result was spontaneous ignition.

An engineer placed a bunch of waste—which had collected in cleaning up a mill—in front of a boiler, in order that the fireman might use it the next morning in starting up the fire. During the night it spontaneously ignited, set fire to the kindlings which had been made ready for the morning, and raised steam sufficient to blow off and alarm the watchman.

## Edison's New Phonograph.

Mr. Edison has so much faith in his new phonograph that he has just constructed works for its manufacture on a very extensive scale. The factory is 600 feet long by 75 in width. He, Edison, claims to have perfected a phonograph by which the human voice is repeated, and, by means of a wax impression on the "reproducer," wax copies or the original cylinder may be mailed anywhere, to be repeated from another phonograph. "We are now able," said Mr. E. to a reporter, "to put a phonograph cylinder at the telephone and make it talk to some one in New York by wire."

A reporter describes the apparatus as follows: The "talking machine" of a dozen years ago has disappeared, but the principle remains and is now in the form of a practical commercial invention as well as a pleasing toy. There is a motor box about 11 inches square and the armature in it is only a horizontal ring or wheel of metal, with 10 pole pieces at regular intervals on the rim. The "cat power" battery is in a separate case underneath. The phonograph is a separate arrangement, attached to the motor-box by two screws. There is a small shaft four inches long, with 100 threads to the inch, which feeds what looks like a pair of spectacles with a receiver and transmitter in one ring. Then there is a recorder in the form of a steel knife fastened to the diaphragm. The receiver is a delicate metal needle, which operates on a phonograph blank of white wax. This blank is hollow and tapers inside so as to bind by friction in hot or cold weather on a metal drum. A second shaft has a coarse reverse thread and is only used where repetition is desired. On the surface of the little wax blank, which looks like an ivory dice-box, can be recorded from 1000 to 1200 words or several musical compositions. A wax blank can be automatically pared from 15 to 20 times for new records. When in motion the phonograph looks very much like a turning lathe.

A CLOSET finished with red cedar shelves and drawers is death to moths and insects.

**TRANSFERRING PICTURES TO GLASS.**—To transfer a lithograph or printed picture of any kind to glass, so that it will be visible from both sides: Give the warmed glass an even coating of Canada balsam or varnish; place the surface of the print on the surface thus prepared when the varnish is partly dry, but still sticky, smooth it out and let it stand in a cool place until the varnish sets; then apply water, and with a soft piece of India rubber or the finger tips rub off the paper so as to leave the image on the varnished glass.

**HOW TO STAMP A LETTER.**—Out of the millions of persons who stamp letters daily, but few know the way to do the "licking." The envelope should always be licked and not the stamp. If you lick the envelope and then apply the stamp, it will stick, sure. If you lick the stamp, you are liable to carry away too much of the mucilage on your tongue, or so much that the stamp will fall off. Many a letter has reached the Dead Letter Office because the sender licked the stamp instead of the envelope.

**A GOOD LIQUID GLUE** is made by taking a wide-mouthed bottle, and dissolving in it eight ounces best glue in one-half pint water by setting in a vessel of water and heating until dissolved. Then add slowly two and one-half ounces strong nitric acid of 36° Baume, stirring all the while. Effervescence takes place with generation of fumes. When all the acid has been added, the liquid is allowed to cool. Keep it well corked and it will be ready for use at any moment.

**TO KILL THE SMELL OF PAINT.**—It is said that the smell of paint, which is frequently so unpleasant in both a new house and one that has been freshly done up, is easily removed by means of a few armfuls of thoroughly damped hay, which should be laid loosely about the rooms and passages and left for 24 hours, after which it may be taken away, and if necessary replaced by another lot.

**STEEL IN A SHIP OF WAR.**—The steel required for the United States ship of war Maine aggregates about 2000 tons.

## GOOD HEALTH.

## Dandruff and Kerosene.

**EDITOR'S PRESS:**—While ago some one asked what to do for dandruff. As I have never seen any answer to the question (although there may have been one that I overlooked), I will state that clear kerosene oil is the best and cheapest thing I ever used. It not only cleans off the dandruff, but makes new hair grow nicely and prevents the old from coming out. I keep a bottle of it on my toilet table and once a week wet the top of my head well with it. The warmth of the head soon drives away the scent. Then put a little perfume on your hair and it will be in a beautiful condition for a week. Those who are not troubled much with dandruff need not use the oil oftener than once in two weeks. I usually put it on my head as soon as I rise in the morning. As I have used it myself and recommended it to others for 12 years, I know what I am talking about.

Another thing I feel convinced about in my own case, is that the use of the oil upon my head has cured me of a partial deafness, from a collection of dry wax in the ear. Do not mistake me and put it into the ear, for I do not think that would be safe; but by constantly applying it outwardly it has done the work.

MRS. J. HILTON.

**THE DANGER IN HOT BATHS.**—It is surprising that death by syncope during the use of hot baths are not more common. The peril of faintness by the mere determination of blood to the surface of the body, thus quickly depriving the heart of its usual normal supply and stimulus, is very great. In cases of muscular weakness of the heart this danger must be imminent whenever the "hot" or even the "warm" bath is used. Apart from this obvious risk, however, there is always the possibility that in weakly or too impressionable states of the nervous system, the peripheral stimulation produced by the application of heat to the whole of the cutaneous extremities of the afferent nerves may so act on the center as to arrest the evolution of energy by an inhibitory influence. It is doubtful if we lay stress enough on this condition when prescribing the use of such external agents as act on large areas of surface, and strongly impress the nerves there commencing. We know how burns of even moderate severity may kill by the impression they produce on the center of vitality from the periphery. There is much to learn in regard to the nature and extent of the central effects which may be thus caused. Whether for good or evil, the application of heat or cold to the cutaneous surface is a potent measure, and one that ought not to be recklessly resorted to, more especially in cases of great susceptibility, involving such excitability of the nervous center as often coexist with fairly good health in a weakly body.

**SAVE THE FINGERS.**—An extract from a surgical journal gives an account of the preservation of a boy's thumb, that had been severed from his hand, by the simple process of securing it to the stump and bandaging. The same paper declares that in many cases severed fingers are needlessly sacrificed.

## Life at High Pressure.

The most salient characteristic of life in the latter portion of the nineteenth century is its speed, and the question to be considered is, first, whether this rapid rate is a good one, and next, whether it is worth the price we pay for it? No doubt we "do" more, but in "doing" everything and "being" nothing? The first point to notice is that we have got into a habit of valuing speed as speed, with little reference to the use made of the time gained. Mr. Matthew Arnold tartly writes of the man who thinks it the highest pitch of civilization that trains run every quarter of an hour between Irlington and Camberwell. He thinks it nothing that the trains only carry him from a dismal, illiberal life at Camberwell to a dismal, illiberal life at Irlington. Baron Hubner describes how, in spite of frequent exhortations, the steamers across the Atlantic face all the dangers of icebergs met in fogs, instead of steering a more southern course and arriving but 48 hours later. The physical consequences of this needless hurry are grave enough; the moral consequences are possibly graver still, though both sets of efforts are as yet only in their infancy and will take a generation or two fully to develop.

The rapidity of railway traveling produces a chronic disturbance in the nervous system, and the anxiety to be in time, the hurrying pace, cause a daily wear and tear as well as accelerated action of the heart, which kills or injures thousands. The constitutions which are thus enfeebled and impaired we transmit damaged to our children, who add to and pass on the sad inheritance. Heart disease, too common already, may be expected to be more common still. We are, perhaps, most of us, conscious at some time of the need to be quiet and alone, but few of us have estimated adequately the degree in which an atmosphere of excitement, especially when we enter it young and continue in it habitually, is fatal to the higher and deeper life; the enfeebling poison which it disseminates throughout the whole character; how it snaps solidity and strength of mind; how it daily becomes more necessary and in increasing measure; how it enfeebles and renders abnormally sensitive the subtle organization of the brain; and how far, by slow and sure gradations, it carries us on toward a mental and moral condition which may justly be pronounced unsound.

But "high pressure" is shown even more in our own style of work than in our rate of movement. The world is more exacting in its demands from all laborers, except merely manual ones. Success in professional, public and commercial life demands more strenuous and exhausting toil, sterner concentration and a more harsh and rigid sacrifice of the amenities which time offers the easy-going than was formerly the case. The eminent lawyer, the physician in full practice, the minister and the aspiring politician, even the literary workman and eager man of science, are now condemned to an amount and severity of exertion which forces one after another to break off (or to break down) in mid-career, shattered, paralyzed, reduced to premature inaction or senility. What work does for the learned profession, anxiety does for the merchant and the manufacturer.

Men who have given up their entire being to business-labor often lose all capability of a better life, all relief for recreation or contemplation, all true appreciation of leisure when it comes at last, for the facilities of enjoyment, like all others, are apt to grow atrophied with disease. The successful man, too, often with much to retire upon, has nothing to retire to; for literature, science, domestic ties, public and philanthropic interests, nature itself have been lost sight of during the mad struggle, and these are treasures the key to which soon grows rusty. This ceaseless and severity of toil give the prizes of life to men of exceptional physique. Physical and cerebral toughness is the prime requisite. The moderately endowed in brains, in health and strength, are "nowhere;" the slow-moving hid fair to be elbowed out of their careers.

Less than a generation ago families could live with all the comforts and essential elegancies of life on a couple of thousand, who strive in vain to do so now. England, says a recent writer, is a paradise for the great proprietor, the successful merchant or engineer, the popular author, and sometimes for the skillful and energetic journalist; scarcely for the quiet, unassuming, unpushing, who would fain run a peaceful and contented course. It is easier to make much than to live upon a little, and the contented nature who desire to pass their lives neither in making money nor in spending it, who wish to use existence wisely and enjoy it worthily, are in danger of being crushed out of existence between the upper and nether millstone of the well-paid laborers and the lavish expenditure of the noble and ignoble opulent. There would seem to be small hope of attaining a standard of life truly dignified and worthy, except through such a regeneration in the tastes and sentiments of the opulent and noble, the leaders of fashion, the acknowledged chiefs of society, as should cause simplicity to become "good style," and luxury beyond a certain point, and ostentation at any point to be voted vulgar. The seeds of this moral revolution are already in existence. A few bright and resolute examples among the universally admired might make them germinate with a rapidity that would amaze us. — *Medical Classics.*

## A New Assay Furnace.

At the Consolidated California and Virginia mine on the Comstock, is a very complete assay office in charge of Prof. F. E. Fielding. To a Virginia Enterprise reporter, Prof. Fielding thus describes a new assay furnace in use there: "This," said the Professor, "is my New Regenerative Petroleum furnace for assaying, on which I have a caveat in the Patent Office at Washington. The power comes from two petroleum tanks—a regenerator tank containing 25 gallons, and a feed tank containing 34 gallons. I can make 1000 assays from one full charge of petroleum. Connected with the feed tank there is a large brass pressure pump, 14 inches in length and 7½ inches in diameter, which forces the petroleum through gas pipes and keeps the pressure on the oil even in the pipes at all times. It is regulated by a small gauge which registers 30 atmospheres and shows the amount of pressure.

"Experience has shown that the best pressure is regulated at the atmosphere of this level, which is from 12 to 15 atmospheres. The petroleum is forced through pipes and through equalizing valves to the furnaces, of which there are 12, there being six on each side, set on a table 9½ feet long, four feet wide and 20 inches high. At the furnaces the petroleum passes through nozzle burners made of phosphor bronze 12 inches long and 1 inch in diameter, and are covered with cast-iron slip tubes. They will last indefinitely. Passing through these nozzles, the petroleum is turned into highly heated hydro-carbon gas, and being mixed with air before it strikes the furnaces, it gives a perfect incandescent heat. Each of these furnaces holds three crucibles, giving us 36 assays every 15 minutes. I could now do all the assaying done on the Comstock in a very few hours daily. The furnaces are automatic, and should a crucible break and spill its contents, it cleanses itself in an instant by a simple outlet at the bottom. The residue is caught on the table, which is covered with two inches of concrete and fire-proof material. The furnaces are furnished with peep-holes, so that every stage of the operation can be seen. The only thing to be done in assaying is to raise the covers and take out the crucibles when ready, and put in new ones ready fixed for the operation, and turn valve on and off in equalizing the pressure of oil on each furnace."

## The New System's Advantages.

"I started these furnaces," continued Prof. Fielding, "on the 17th of this month. My first assay was perfect. I knew it would work but never dreamed of so complete a success. Its advantages over the old system of assaying are over 100 per cent. I could place an assay office like this in a parlor and never muss the floor or taint the ceiling with smoke. It is perfectly incandescent. It makes no more smoke than an electric lamp. All the material is consumed, and there is no smell. It doesn't cost near as much as the old furnace. There is neither masonry nor brick work to it. There is much saved in crucibles and covers. There is no coal used. I do as much work by this system in 2½ hours as I formerly did in five. It does not cost by 25 per cent as much for fuel. It is much healthier, as there is no incomplete combustion of coal to be breathed in the lungs by the workmen. There are no ashes, cinders, dust, smoke or sparks thrown off by it. The heat is intense, yet perfect in all its action. Yes, I made everything myself. There is not a thing connected with it that is not my work."

**ANOTHER DEBRIS SUIT.**—The county of Sacramento has begun suit against Weisler, Geo. Parker, Edward Mitchell et al., composing the North Star claim, who, it is charged, are engaged in the business of hydraulic mining on the American river and tributaries, asking that defendant be restrained from dumping debris into the water courses named. It is alleged that the stream have been filled up to such an extent as to cause overflows and great damage and compelling the resort to artificial means for confining the waters within bounds. It is further alleged that the property of the plaintiff, the Court House, Hall of Records, etc., is greatly endangered. A temporary injunction is asked for, pending the trial of the action.

**THE COAL MINERS' STRIKE.**—The leaders of the Knights of Labor and Miuree Union at the Newcastle coal mines have succeeded in arranging their difficulties regarding the strike, and made overtures to the Oregon Improvement Co. representative which were accepted, and the minees have commenced turning out coal again. This ends the strike that began with shooting and threats of bloodshed, and on account of which the Oregon Improvement Co. lost \$4000 a day during the time that the output of coal was stopped, or over \$30,000.

**AN ELECTRICAL COMPANY.**—Articles of incorporation have been filed in the office of the Secretary of State of the Electric Light and Motor Manufacturing Co. of Ohio. The purposes for which the corporation is formed are to carry on the business of manufacturing motors and electrical machinery, and to produce electric light. The principal place of business is Chico. The directors are James Anthony, Jesse Anthony, A. McFayden, Wm. H. Scholter and B. F. Clarke. The capital stock is \$100,000, divided into 4000 shares.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**PLYMOUTH.**—Cor. Amador Ledger, June 2: At this time Plymouth is dull, and there are several vacant houses in the town, a thing that has never happened before since the town started. The news as to when the Plymouth Consolidated will start to work again is vague and meager. Everybody has a theory of his own, and tells it, so that there are all kinds of rumors afloat. The latest that we have heard is that the mine will start up about the 1st of October next. The New London is still sinking, and it is generally reported that the mine abounds in rich ore. Anyway the perseverance that has been shown by the management of the mine makes everybody hope that it may prove a rich paying property. We hear that the War Eagle machinery works to a charm and that the cleanup was highly satisfactory to the owners. They still continue to take out good rock from the mine and think they have struck an extensive body of rock. The Glass Ball mine, just west of the War Eagle, is prospecting well, and Sol King and Wm. Bristow, the prospectors, think they have a good thing. H. P. Gordon is still pushing his tunnel and hopes to strike the lead before many days.

#### Calaveras.

**QUARTZ.**—Mountain Echo, June 1: The quartz mining outlook for Angels this summer, is very flattering. There will be some astonishing sales of mining property made in this section within the next three months, and changes will be wrought that will astonish the oldest inhabitants. Angels is certainly on the brink of the greatest mining boom it has known within the past 20 years, or more. All the necessary machinery for the construction of the hoisting works at the Whittle mine, situated about three miles southwest of Angels, has been delivered on the ground during the week. Operations will be commenced at once. The mine was bonded recently. The Utica mill will start up next Friday, after having been closed down about a month for repairs. Joseph Wilson has located 1500 feet of quartz vein in Angels mining district, near the Miller and Rooker mine.

**RICH ROCK.**—Calaveras Chronicle, June 2: From the Riverside mine in Hundred Ounce gulch, on the Mokelumne river, north of this place, some of the richest specimens of rock that one could wish to see have recently been found by Messrs. Holbrook and Blair, who have gone into the project of making explorations for a vein of quartz supposed to exist there. Hundred Ounce gulch was very rich in quartz gold in early times, and the reasonable inference is that there must exist a quartz ledge in the upper ground. The surface ground in that locality consists of red soil from three to six feet deep, full of quartz rocks and boulders of all sizes. Messrs. Holbrook and Blair have undertaken to uncover this surface by the hydraulic process, having constructed a ditch, laid down pipe, etc., to bring the water with which to operate. These specimens found are what is known as "float." The portion so far uncovered shows a broad quartz formation, but whether this will prove the vein from which all this "float" comes remains to be ascertained later. The indications, however, are most flattering, and the parties feel sanguine of uncovering a rich lead.

#### Nevada.

**THE EMPIRE.**—Tidings, June 2: From all we can learn, the old Empire is more than holding its own, notwithstanding the setback attending the recent disastrous explosion. One hundred and fifty men find employment here. Last week an air compressor auxiliary pump in the shaft was replaced by two "Cornish plungers," and new column pipe was put in. The old pump could not hold the water. Under the new arrangement a depth of 2000 feet can be obtained and all water handled. The shaft (incline, as are nine-tenths of the shafts in this district), is now down over 1700 feet, and the fact that sinking will be resumed next week, speaks loudly for the quality of ore found at this great depth.

**THE OUTLOOK BRIGHTENING.**—Nevada City Herald, June 1: The resumption of work at the Providence, the strike of good ore at the Nevada Sweet, the good prospects at the Merfield, and the starting of work at the Pittsburg, where a larger plant is being put in, begin to make things look very much brighter in this section. The good times have been delayed by local causes, but they must come. Other mines ought to, and will, start before long. If a sale is consummated with the Nevada City, or if it will pass into the hands that will work it, other mines in its vicinity will start up. The water there is too heavy for one mine to handle it all. The lessees of the Muller and Walling mine are about ready to start their hoisting works, and to commence sinking. There is a very good chance of getting a good mine there. The Nevada County mine is getting some very good milling ore, and is looking well. Altogether, the outlook is much more cheering.

**NEW ROCKY BAR.**—Grass Valley Union, June 1: John Treibner and party are working on the New Rocky Bar, and the result of their labors is about 50 tons of as fine-looking ore as can be seen anywhere. They are working with whim power, and are down about 125 feet from the surface. The ledge in the bottom of the shaft averages one foot in width, and out of the pile on the dump, scarcely a piece can be found but what shows free gold. This is the ledge pitching north and they are working on, and it is supposed to be the famous Ford and Mullin ledge that paid so handsomely a few years ago. The rock on the dumps is certainly rich, and plenty of the same kind is coming out every day. The mill, belonging to the company, will soon begin its work on this ore, and good results are confidently anticipated.

**RELIEF HILL.**—The Waukesha drift mine is owned by Williams, Jones & Co., and is worked by the owners. They have been running the tunnel ahead about 300 feet and have struck very promising gravel. They have let a contract for getting out timbers and are going to push ahead work quite extensively this season. The Union Co. is composed of Erasmus, Jepson Bros. & Co. They have run a prospect tunnel about 700 feet, from which point they made an upraise and have struck very good gravel.

The Blue Lead have again started up work. They have a tunnel over 1700 feet long, which was run through hard bedrock. They have made an upraise and struck gravel, and will take some of it out and work it. This lead is supposed to strike the Derby lead. If so the boys may be "on to" a very good thing. The Eureka Co. are working their drift claim at Relief Hill and it is paying well as usual. There is some assessment work going on around to hold claims, but things are generally pretty dull.

**OMAHA AND LONE JACK.**—Grass Valley Tidings, June 2: That Geo. Mainhart understands mines, no one can doubt who has a knowledge of what he has done at the Omaha and Lone Jack Consolidated during the past six months. The Omaha, 600 feet in depth and with drifts running from 400 to 500 feet, has been cleared of water and retimbered; new buildings have been erected and a water-power hoisting and pumping plant placed in position. This includes two Pelton wheels. On the Lone Jack a steam plant has been erected and the 500-foot shaft, with its many drifts, cleared of water and retimbered to the depth of 181 feet. When this shaft shall have been pumped dry it is the intention to connect it with the Omaha shaft and work the property through the latter. Twenty-five men, including contractors, are employed by the company. In the Omaha lower levels ore of good grade has been found and the stockholders and the superintendent are alike much encouraged. It is calculated to start up the Omaha 10-stamp mill—not a bad reduction works, by the way—early next month, when substantial returns are confidently expected from the ore now being extracted. Parenthetically, it may not be amiss to state that while the Lone Jack was operated \$500,000 was taken out.

#### Plumas.

**BUSHMAN & CO.'S MINE.**—National, June 2: The Bushman mine is located about 3½ miles from Quincy on Little Blackhawk ravine. A tunnel has been run 225 feet on the ledge and with excellent prospects. The company has just received a Huntington mill, rock-breaker and Challenge self-feeder. W. McPherson is putting up a 30-foot overshot wheel which will furnish plenty of power to run the machinery. The mill will be in operation in about four weeks. Plumas county has plenty of good paying ledges if they were developed. A little energy displayed in the right direction will make Plumas the leading quartz mining county in the State.

#### San Benito.

**THE ANTELOPE MINE.**—Hollister Free Lance, June 1: To G. W. Towle, of Emmett, we are indebted for some valuable information concerning the work that is being done in the development of the Antelope copper mine, and the ultimate prospect of the mine. The mine was discovered last December by G. W. Flemming, who, while quail hunting near the summit of the mountains, noticed some loose rock at his feet that apparently was of a mineral nature. He brought home a few specimens and had them tested for quicksilver. They proved to be rich in copper. Then he, in company with G. W. Towle, E. C. Towle, S. S. Ackley and one other, located the mine. At first a shaft was sunk where the float and out-croppings seemed to give the most favorable indications, but after going down a few feet the ledge on which they were, pitched off and compelled them to turn the shaft into the hill. Water then commenced to come in on them and they were forced to desert work at a depth of only 28 feet. But by this time they had struck what was apparently an inexhaustible supply of extremely rich copper ore, and samples were taken to San Francisco and submitted to experienced mining men, whose unanimous verdict was that the ore was of a superior quality. It was assayed and averaged 20 per cent to the ton in copper. The mine is owned in five shares. One-half share was sold last week for \$700. About \$2000 are necessary to complete a tunnel that is now being run into the hill about 60 feet, and which will strike the vein in about 100 feet more, also to erect suitable reduction works. Mr. Towle believes he has a good prospect for the development of a mine that will, in a few years, prove of vast benefit to this county, and which will give employment to many hands. One ton of the ore will yield 400 pounds of crude copper, which sells from 10 to 15 cents a pound. Two men can easily get out a ton of ore a day. Some little difficulty will be experienced in reducing the ore to crude copper on account of lack of water, the ore having to be hauled to the river, two miles distant. But this difficulty will be counted as nothing if the mine proves as rich as the present indications warrant one to believe. Mr. Towle will proceed at once with the tunnel, which can be run at the rate of two feet a day. The vein of ore ought to be tapped again easily in a month's work, and when this is accomplished a body of copper ore will be laid open which will be superior to any other copper mine on the Pacific Coast.

#### Sierra.

**THE BUFFALO MINE.**—Sierra Tribune, June 1: At the Buffalo mine the tunnel is in 350 feet. We are informed that the ledge through this tunnel will average something like 14 feet in width. The face of the tunnel is about 150 feet below surface. Yesterday No. 2 adit was started on a level with the bed of the creek and 80 feet below the upper tunnel. The owners expect to erect a 10-stamp mill there this season. Our mountains are filling with prospectors, and new discoveries of fine auriferous ore is being unearthed almost daily. Sierra county promises to eclipse any of the big mining camps on the Pacific slope.

#### Shasta.

**THE CENTRAL MINE.**—Redding Free Press, June 2: Owing to some new machinery which it is intended to put in, and the fact that a large bulk of the ore now received is not of sufficient high grade to ship, it is thought best to shut down the mine for the present. The necessary chlorination machinery, which is an English patent, will occupy most of the summer months. Probably a tunnel will be run soon on a 200-foot lower level, and it is expected to resume operations about October 1st. Major Whitehouse left for the East this week on his way to England. Mr. A. A. Anthony is in charge of the property at the mine.

#### Trinity.

**LOWER TRINITY TUNNEL.**—Trinity Journal, June 2: Work is being resumed on the Lower Trinity tunnel. Mr. McCus is getting things in readiness there so that as soon as Mr. John Bamber, the contractor, who is expected daily, arrives, work can at once be resumed. Mr. Bamber will complete

the tunnel as soon as possible. The company through their agents, Messrs. Fowler and McWorthy, have purchased the Taylor Flat mining property from J. A. Tinsley for \$8000 and will work that property in connection with the tunnel. Mr. McWorthy left for Oakland Sunday, but will return in about two weeks and superintend the construction of a dam across the river. When the tunnel is completed the river will be turned through it and the bed will be worked by elevators, for which purpose the Taylor Flat water will afford ample power. Another season's work will see the tunnel in operation and the owners can look for a return on their investments. Next winter the company will open Taylor Flat in a proper manner, at the lower end, and work the claim systematically. These operations will be of great benefit to that section of the county.

**A GOOD CLEANUP.**—The Enterprise mine of the East Fork mining district still holds its own as a first-class producer of bullion. Mr. Wm. Leavitt brought into town this week \$3700 as the cleanup from 27 tons of ore from the mine. The gold run into a brick made a very pretty sight for tired eyes to look upon. East Fork has a very promising future, and the erection of a few mills will give it a permanent boom.

#### Tuolumne.

**LOOKING WELL.**—Union Democrat, June 2: The Laura mine near Cherokee, superintended by Mr. S. J. Corbett, is looking well, and the lead averages three feet in width. Work on the new ditch of the Eureka Consolidated Co. is being pushed with all possible dispatch. The business troubles of the Black Oak Mining Co. have been arranged. It is reported that the Patterson mine has developed a rich chute in the south exploration works at a depth of over 500 feet. John Garaventa is about forming a local syndicate to work his mine beyond Sonora—that is, in case the parties who have been negotiating for its purchase in London do not consummate matters at an early date. John Hartwig had one ton of quartz crushed at Mr. Ferguson's mill lately and it yielded 13 ounces of gold. He has a shaft on the mine and it is now down about 70 feet. Mr. Frank J. Gross of Tuttletown informs us that the mill on the mine recently bonded by him to San Francisco parties is about ready to run. The mill has 15 stamps, but as the parties are in a hurry to start operations, it will begin crushing quartz next Monday with one battery of five stamps. The other stamps will be placed in position at leisure. This lode runs northerly and southerly, averages 2½ feet in width and prospects well. A shaft 35 or 40 feet in depth was sunk on this mine some years ago and about \$10,000 was taken from it.

### NEVADA.

#### Washoe District.

**YELLOW JACKET.**—Virginia Enterprise, June 2: Are shipping 100 tons of gold-bearing ore to the Santiago mill daily.

**KEYS.**—Are hoisting ore from the winze on the 240 level.

**ANDES.**—Still drifting on the 240 and 350 levels in a favorable formation.

**WEST CON. CAL. AND VA.**—Are putting up a hoisting plant and sinking the shaft.

**BULLION.**—On the 640 level the two crosscuts, east and west, are making good progress in a favorable formation.

**SCORPION.**—The south drift on the 300 level has been extended 20 feet during the week, making its total length 295 feet.

**UTAH.**—On the 372 level the south drift has been extended 57 feet; total, 280 feet. The formation is clay, porphyry and quartz.

**BALTIMORE.**—Are still pumping water, but will soon have the mine drained, when work will be resumed on the 280 level north and northwest drifts.

**CONFIOENCE.**—Are shipping to the Brunswick mill for reduction 192 tons of ore daily, the average battery assay of which shows a value of \$32.64 per ton.

**ALTA.**—Machinery at the mine and mill running smoothly. Are hoisting about 30 tons of ore daily from the 825 and 1150 levels, and reducing the same at the mill.

**IOWA.**—The east drift from the south drift, McBe tunnel, has been advanced 20 feet. Have cut through some fine-looking quartz. Are still in vein matter, showing fair assays.

**BEST AND BELCHER.**—On the El Dorado tunnel level the northwest drift from the main west drift has been extended 55 feet; total, 157. The formation is quartz, showing value by assay.

**CHOLLAR AND POTOSI.**—The mines are yielding the usual amount of ore. Prospecting work is actively prosecuted. Have commenced laying pipes for the new system of water-power.

**BELCHER.**—Have stopped the south drift from the 500 upraise, and started a west crosscut 90 feet south of the north line. It is now in 21 feet. The 1300 raise advanced 31 feet on the slope (west) during the week.

**LAOY WASHINGTON.**—Are raising from the 725 level, and are now up a distance of 320 feet in clay adjoining the veins. Are crosscutting from this raise at a height of 110 and 210 feet above the 725 level.

**HALE AND NORCROSS.**—During the week have hoisted 1575 tons of ore from the 600 and 700 levels, and have shipped 1000 tons to the Mexican mill—average battery assays of same, \$37 per ton. Have bullion on hand and previously shipped amounting to about \$90,000.

**CHALLENGE.**—The joint Challenge-Yellow Jacket raise on the 1000 level is up 44 feet, 19 feet having been added during the week. The Challenge raise on the same level is up 110 feet, having advanced 22 feet during the week. The last 10 feet run was through good ore.

**ALPHA AND EXCHEQUER.**—The west drift on the 122 level is in a mixture of clay and porphyry, while the south drift continues in quartz and porphyry. The northeast crosscut on the 222 level is in clay. The north lateral drift on the 382 level is in a mixture of quartz and clay, and the winze, now down over 120 feet, is still in clay.

**CROWN POINT.**—The south drift from the 600 level, from the east crosscut, advanced 30 feet in

low-grade quartz. Have stopped it and are pushing the east crosscut, which has been extended 31 feet during the week. It passed through six feet of quartz which assayed well, and the face is now in porphyry and clay, with some water running from it.

**SAVAGE.**—Work progressed as usual on the several levels during the week, and the ore resources are looking well. Are extracting about 100 tons of ore daily from between the 400 and 900 levels, and are shipping about 80 tons daily to the Rock Point mill—battery samples of same average \$35 per ton. Have bullion on hand and previously shipped for the month amounting to \$28,000.

**OCCIDENTAL.**—In the upper tunnel, at the top of No. 1 upraise, south of the north incline winze, the south drift has been extended 14 feet; total, 137 feet. No. 2 upraise, north of the north incline winze, has been carried up 9 feet; total, 113 feet. At this point the south drift has been advanced 3 feet. Forty-five feet below the upper tunnel, in the boiler winze, the north drift has been advanced a total of 20 feet.

**GOULO AND CURRY.**—On the El Dorado tunnel level the southwest drift has been extended 35 feet; total, 236. This drift has been connected with the upraise from the drain tunnel. The drain tunnel northwest drift has been extended 73 feet. The formation is quartz and porphyry. During the week there has been extracted from the 250 and 300 levels 180 tons of ore, and shipped 27 tons to the Douglas mill. The Douglas mill has worked 1000 tons and 1600 pounds of ore, yielding a bullion value of \$16,608.18. This bullion has all been shipped to the home office in S. F.

#### Bristol District.

**TESTS.**—Pioche Record, June 2: The experimental run now in progress at the Bristol mill, made to determine whether or not the ore there can be profitably treated by the leaching process, proves that method of treatment to be superior to any other for the working of the ore there. The White & Howell roaster was fired up last Thursday, and on Friday the new set of Wall rolls were put to work crushing ore. So far, about 150 tons have been crushed, roasted and chloridized. The ore is run through a 10-mesh screen, and chloridized to 90 per cent without trouble, and leached up to 85 per cent, the filtration being perfect. Ore will be crushed for a few days longer, when the product will be leached, which will take some time, as the vats and tanks are not in order yet. These tests are being made under the management of Mr. Anthony H. Godbe, and are so satisfactory that there is but little doubt but that the leaching method will be adopted in working all the ore there. The average value per ton of the ore now at the mill is much lower than was at first stated, and the bulk of it will need resorting. How soon active work will be resumed at the Mayflower mine is not known, as the company at Minneapolis, Minn., has not intimated what will be done.

**COPPER SMELTER.**—Chas. L. Roe is erecting a copper smelter at the north end of the mill at Bristol. It will be of about 10 tons per day capacity and the blower will be run by steam from the mill. Roe has about 60 tons of good copper ore lying on the dump at the Ohio mine at Bristol district, which was mined years ago. The present price of copper justifies him in erecting the furnace and developing the mine, in which a good seam of copper ore is exposed, but which has remained untouched for years past on account of the low price of the metal and the expense of transporting the ore to market.

#### Eureka District.

**SPEISS AND MATTES.**—Sentinel, June 2: The new arrangements at the Eureka Con. furnaces for economically handling the speiss, mattes and slag are completed. The engine has been set up on the north end of the dump, and a substantial incline track laid to connect with a wide trench at the side of it. From the trench three tunnels have been started to run out under the dump, which will be loosened up from time to time by exploding big charges of powder in it. The slag, speiss and mattes will be dropped into cars, and then run out to the trench, hoisted to the top of the dump and the slag deposited at the north end. The speiss and mattes will be conveyed to a bin situated underneath the furnaces, over a tramway that was built for that purpose, and there be loaded into a skip and hoisted to the feeding rooms. Thus the whole mass of material will be handled in the cheapest possible manner. From 40,000 to 50,000 tons of speiss and mattes will remain to be treated, which will take over two years to resmelt at the rate it is now, and will be a source of considerable revenue to the company. Al. Titus has the direction of the work under Superintendent Donnelly, and on account of his many years experience in the employ of the Richmond Co., is a first-class man in the place.

#### Morey District.

**SILVER.**—Belmont Courier, June 2: At Morey John A. Moore and E. Schendell, who are engaged in mining, have uncovered one of the biggest bodies of silver ore ever found in the district—it is equal to that discovered by Hammond & Austin some years ago—the assays run from \$300 to \$500 per ton; 12 miners are engaged stopping the ore. The Fletcher Bros. have struck a fine body of ore in their mine; John Williams is hauling ore from Morey to Eureka; Morey will be a lively camp this summer.

#### Patterson District.

**READY.**—Pioche Record, June 2: The quartz mill at Patterson district which was recently removed from Silver Park district is about ready for work. Ed L. Robertson, the manager, has offered such favorable rates on ore that D. C. McCarter of Silver King district, will dispose of his ore to him instead of shipping it via this place to Salt Lake City, as intended a few weeks ago.

#### Spanish Belt District.

**LOOKING WELL.**—Belmont Courier, June 2: J. E. Severance reports that the Barcelona mine of Spanish Belt continues to look well. The ore extracted from the south end is of a high grade, and the pay streak increases in width as the work advances. The north end of the mine is looking fine, and there is considerable milling and concentrating ore in sight. The force of miners is being increased as rapidly as possible. Mr. Severance has put a concentrator below the one which is successfully concentrating the low-grade ores of the Barcelona for the purpose of concentrating the tailings. There are several dollars in these tailings which can thus be saved without incurring any additional expense. The

mill is running nicely and enough ore is being hauled from the mine to keep the concentrators running steadily. It is the intention of Mr. Severance to send for several more concentrators which will be set up near the mine at Spanish Belt, and thus save the expense of hauling. The high-grade ore will be sent to Salt Lake for treatment, and the second-class ore will be reduced in the Monitor-Belmont mill. Spanish Belt is in fair way of becoming a permanent mining camp.

#### Tuscarora District.

NAVAJO QUEEN.—*Times-Review*, June 2: An increased flow of water has retarded progress considerably this week. It has now slackened off. Have commenced drifting southwest on the ledge, which shows a fair grade of ore in the face.

NAVAJO.—Winze on east vein, 250-foot level, sunk 9 feet; total depth, 38 feet. Developing some good ore.

NEVADA QUEEN.—Upraise in the east vein has been carried up 27 feet, connecting with the winze from the 200-foot level, supplying good air in this part of the mine. In putting in timbers over the level, the ore taken down is high grade; car samples, \$274.

NORTH COMMONWEALTH.—During the week, 35 feet of prospect shaft No. 3 was timbered. At 30 feet the shaft encountered a large vein showing considerable mineral. The last 3 feet is a good grade of free-milling ore. The bottom of the shaft is still in ore.

GRAND PRIZE.—On the 200-foot level the west drift has been advanced 14 feet; the face showing a 20-inch vein of high-grade ore. During the week a north crosscut has been started from this drift and is in 11 feet in a favorable formation. East drift advanced 13 feet; the ore continues right along and is getting larger as it is opened up.

NORTH BELLE ISLE.—No. 1 winze, 300-foot level has been started north of No. 3 crosscut and sunk 10 feet. The vein in the bottom shows a good width of high-grade ore. The regular amount of ore has been extracted from the different levels and sent to the mill and dumps. Material for the concentrating plant will begin to arrive to-morrow.

COMMONWEALTH.—100-foot level: An east crosscut has been started near the face of south drift and driven 21 feet; the face is all in vein matter, giving low assays. The drift from upraise north of the shaft, 150-foot level, has been extended 8 feet, showing 14 inches of good ore; average assay, \$280 per ton. This drift will reach upraise from east crosscut, 150-foot level in a day or two. 150-foot level: South drift from the station has been advanced 15 feet, exposing fine ore the entire distance. East drift following the ore found 61 feet south of the shaft, has been advanced 14 feet, and is showing more rich ore than at any time heretofore; car samples from these two drifts average \$260 per ton.

#### Tybo District.

NYE.—Belmont *Courier*, June 2: At Tybo the Nye Mining Co.'s mill is running 20 stamps on ore from the 26 mine, and 30 tons of it are run through every 24 hours; 16 men do all the work in the mill—8 on each 12-hour shift; the Dinwick mine is producing its usual quantity of good ore which is shipped to Eureka for reduction; the Gilmore Bros. mine is producing some fine ore which is sent to the Nye Mining Co.'s mill for reduction; L. B. Fairbank continues to prospect his mine.

#### ALASKA.

BLACK SAND.—Juneau *Record*, June 2: The latest mining craze in the territory is the black sand deposits in the Yakutat country. Everyone who has money enough and no business affairs to hold them back, are pushing on toward this section. The little schooner Charlie, Capt. J. J. Healy, with a large number of passengers, had a perilous trip, but at last reached Yakutat in safety. The steam schooner Leo has also sailed for the black sand regions, carrying 39 passengers and a large quantity of freight consisting of lumber and supplies. The Charlie has returned, and the reports brought back from the Yakutat country by Capt. Healy are not the most favorable. An undue excitement was created among many of Juneau's citizens by irresponsible and fictitiously glowing accounts published of the deposits in that section. It has even been published that the black sand brought from there assayed between \$40 and \$60 to the ton, which of itself was an outrage, and only intended to excite those who knew little or nothing concerning black sand. It is claimed that sand which will assay from \$1.50 to \$3 will pay handsomely to work. However, there is still reason to believe that Yakutat is in a gold-bearing section, and with the number of experienced prospectors there at present, we have every reason to hope that rich diggings will be discovered this summer.

MILL.—The work of clearing ground for the foundation for the new 120-stamp mill on the Treadwell claim is progressing rapidly. Quite a number of placer locations have been made lately on Gold creek, near its confluence with Gastineau channel, just outside of the town limits. The Huntington quartz-mill, erected last summer by Price & Johnston, at Berner's bay, is reported to have been carried away recently, or covered up by a snowslide. Clark Miller and Charles Crockett, two gentlemen from Southern Oregon, who have had considerable experience in black sand mining, left for the Yakutat country on the Leo. These gentlemen have a new process for separating the sand and gold, and propose giving it a thorough and practical test.

#### ARIZONA.

CHLORIDE NOTES.—Cor. Mohave *Miner*, June 2: Once since the days of the 60's has the mining outlook jumped into prominence hereabouts, and that is now. At the Connor mine Messrs. Kelly & McKinnon are taking out a ton of rich ore per shift while drifting to the old works, and as soon as connection is made and stoping commences you may depend on regular shipments of rich ore, as for 20 feet in the drift they have from 27 to 42 inches of rich ore, which has never before been equaled in the Connor mine. Messrs. Heimrod, McDuffie, Uncapher, Meehan and Brandon have taken a lease on the Connor mine south from the steam hoist, and will commence operations as soon as they can move over. Ed. F. Thompson has purchased the interest of Dan McGlone in the lease of the Lone Star, and as that mine is producing ore sufficient to keep ex-

penses down, he has the hopeful expectancy of all miners.

#### COLORADO.

SILVERTON NOTES.—*Miner*, June 1: The ore shipments average 60 tons daily. In 30 days from now they will be 150 tons. A. H. Bridgman and W. W. Reese have secured the lease on the Bear mine, and operations will begin early next week. The Green Mt. concentrator will soon start up on the second-class ore, of which there is an endless quantity in the Green Mt. mine. The Veta Madre Co. will erect their new concentrator at the terminus of their tramway, which will be almost on the town site of Howardsville. Dr. J. N. Pascoe has received notice from Messrs. Bauman and Ehrhardt that they will resume work and pay up the indebtedness on the Prodigal Son in the near future. Sam Hecr is hiring men to work on the Cleveland, a well-known property three miles below town. The ore in this mine is worth \$800 per ton. Jerry Fisher expects his stamp-mill and concentrator to arrive before the 10th of June. The site has been excavated, and lumber is being placed on the ground for the buildings. It will be in operation by July 15th. The transfer of the Middleton concentrator took place to-day at Howardsville, the Veta Madre Co. being the purchasers. A large force of men are being employed and the mill will be put in shape for operation with the utmost speed. Mr. Geo. H. Inge is making preparations to work the Jayhawker in Ice Lake basin very extensively this season. The mine already has over 900 feet of development and a large body of ore has been opened. Millruns last year returned a value of 2½ ounces gold and 30 ounces silver per ton. The North Star on Silt in struck a solid foot of gray copper with the long crosscut tunnel. Drifting both ways is now going on, and the ore streak improves with every foot. Five tons per day is delivered at Stojbers' sampler at present, but the force will soon be increased and the output largely augmented. The strike in the Tower Mt. Co.'s mines still holds good, and it seems to be a permanent chute. An upraise has been made 40 feet in the mineral and the ore shows no diminution either in grade or quantity. A lot of the ore, several tons, has been sent to town for a test, and regular shipments will begin as soon as arrangements can be made for packing.

LOWER CARBONATE HILL.—*Denver Tribune-Republican*, June 2: James Campbell, manager of the Wyoming Mining and Prospecting Co., operating at Leadville, is in the city. Mr. Campbell is engaged in sinking the Pocahontas shaft, situated on the northwest slope of Carbonate hill, and just below the Glen-Pendery fault. The shaft is now down 350 feet, and Mr. Campbell yesterday received a telegram from Nels Larsen, his superintendent, stating that contact had been encountered and that the outlook for mineral was very good. As Mr. Larsen sank the St. Mary, Big Chief and many other producing shafts in the Carbonate camp, his judgment may be accepted as good, and the probabilities are that ore will be found on further exploration. The shaft is quite wet, making perhaps 500 gallons of water per minute, but there are now three pumps employed, connected with a 10-inch discharge pipe and no difficulty is anticipated in handling the water. An additional 80-horse power boiler has just been ordered to reinforce the plant. The shaft is on the line of the great Morning Star and Maid of Erin ore chutes, and there is a possibility of the Pocahontas becoming the McKeon of Carbonate hill.

EAST FRYER HILL.—Among the pioneer mining men of Leadville is the city at present is L. D. Roubush, a large owner in the Robert E. Lee mine. He reports the Lee looking very well and yielding some very good ore, which is being mined through the north shaft on the Matchless mine. The El Paso shaft, in which Mr. Roubush is also largely interested, has attained a depth of about 485 feet and the outlook is most encouraging. Sinking continues steadily, and there is little question that only a short time can elapse before the ore zone, and in all probability good mineral will be encountered. The El Paso, together with other claims, belongs to the Ward Consolidated group, and is being developed by Messrs. D. H. Moffit, Eben Smith, L. D. Roubush and others. The Forepaugh mine is shipping about 100 tons of ore a week. The mine looks very encouraging and gives evidence of re-entering the list of bonanza mines at an early day. The other properties in this portion of the Leadville district show no material changes.

#### IDAHO.

THE WAR DANCE MINE.—*Wood River Times*, June 1: A chunk of ore from the War Dance mine, on Deer creek, was shown on Main street, to-day, which is as pretty a specimen as was ever seen here. It is just as it came from the vein, yet is as square and smooth as a glass paper weight. It is about two inches thick and four inches square, a ribbon of gray copper ore to three inches wide running transversely through it, and weighs about eight pounds. It will probably assay 3000 ounces silver and 75 to 80 per cent lead per ton. There are 26 men employed at the War Dance group, and much ore is being extracted. The most of this is left on the dumps, awaiting the building of the concentrating works, which Mr. Burns will go to Denver, next week, to hurry, as he wants to get them running at the earliest possible date. They will run by water-power. At present only about a carload is shipped per week, the owners aiming to keep the income just abreast of the outlay. The ore-chute or chimney is 1000 feet in length and eight feet in width in places. From present appearances the War Dance will give steady employment to 100 men before the summer is over.

ROSEBUD GULCH.—*Wardner News*, June 1: Hardly a day passes that we do not hear of most encouraging reports from Rosebud gulch and the country adjacent. The great extent of the mineral belt in that region is a marvel to all miners, and it is no wonder that men owning locations thereon should feel encouraged. Horton & Alger were driven out by water last week in their lower workings on the Nellie claim where they were sinking a shaft, and as other workings were also wet they concluded to prospect further up the mountain. At a distance of 800 feet, on the same lode, they have uncovered 50 feet of rich ore averaging 12 inches in width which will run from 1000 to 3000 ounces silver, dry ore. There is a large quantity of this ore profuse in

native silver, and this last find averages a better grade than any heretofore found, and is a much stronger chute. It seems strange that every day we are found leaving Coeur d'Alene for other points and far distant regions to prospect for mines when there is plenty of vacant ground, within half a mile of our railroad, showing good mineral on the surface. Opportunities are plenty where men, who are willing to work, can get rich and abundant returns for their labor if they will only take the pains to look the country over.

ORO FINO.—*Idaho Avalanche*, June 2: We are pleased to note that more men are being put to work on the Oro Fino lode, and that bids are being received for the cutting and delivery of 1000 cords of wood at the mine. This seems to indicate that work will be prosecuted vigorously on the Oro Fino group of mines. The drift being run on the Sinker is now in about 300 feet, with a good-sized lode and fair-milling ore. From appearances the mines belonging to the Oro Fino group are going to produce a whole lot of ore the coming season.

#### NEW MEXICO.

DEVELOPMENT WORK.—*Silver City Enterprise*, June 1: Fred Rogers came in from Gold Hill this week on court business. He has been running his arrastra for some days, but has not yet made a cleanup. Que Red, a well-known sport, has gone to mining at Central, and is said to have a splendid gold prospect, many of the specimens taken from his mine contain wire gold. Que is working like a Turk. L. D. Fisher is doing considerable work of late on his mines at Central, and has an abundance of good ore in sight. The Mogollon Mining Co. has been organized in St. Louis. The men reported to be in this move are said to have gradually gathered in the bonds of the Sheridan mill at Socorro last week. It is understood that Peacock men are in the move and will run the Sheridan on ore of that mine and for custom work. Dr. Franklin Mahon, who has been in charge of the Santa Rita mines during the past five years, was in town yesterday. He states positively that the mines have not been sold, but are still owned by the Boston Co., newspaper reports to the contrary notwithstanding. The mines will be cleared of water and debris preparatory to beginning work.

COONEY CAMP.—The Cooney mill on Silver creek shut down Saturday for the purpose of putting in pans and settlers, it being demonstrated that plate amalgamation did not save the chlorides. The pans have been hauled in and are being put in place as rapidly as possible. Probably in ten days the mill will start on assorted rich ore which is being packed from the Maud S. Previous to shutting down he had made several tests on ores and concentrations in a small cleanup pan under the supervision of J. A. Davis, the results being 90 per cent saved by pan amalgamation in the concentrates collected during the run made by plates, and 98 per cent in the ore samples from the mines. The mines are developing into large ore bodies, the Maud S having a solid breast of high-grade ore eight feet wide. There is upon this mine alone enough ore in sight to keep the Cooney, Peacock and Sheridan mills running for five years.

#### OREGON.

GRAVEL AND QUARTZ.—*Jacksonville Times*, June 1: The Sterling Mining Co. has a good supply of water again and is moving heaps of gravel. W. G. Kenney has purchased a fourth interest in Klippel & Keten's ledge in Willow Springs precinct. The late rains have increased the water supply somewhat, which will enable many of the miners to clean up the last season's work. Granville Sars & Co., who have an excellent quartz ledge in Willow Springs precinct, are running a tunnel to tip it lower down. The ore prospects well. Klippel & Co. have several men engaged in taking out and assorting quartz. Their ledge has increased in size and the ore looks very well. They crushed some of the richest in hand-mortars during a portion of two days this week and got \$320. A Hatch sent 15 ounces of ore from his ledge on Jackson creek to J. H. Fisk of Portland, assayer, and received a very favorable report, the assay showing about a dollar per ounce in gold and silver. The quartz is principally silver-bearing and very rich. E. Sanderson Smith has a large force of men at work on the Gold Hill Mining Co.'s mill, which was started up yesterday. It has a capacity of 15 tons a day and is expected to do good work. A large amount of excellent ore is already on the dump and much more in sight. It is to be hoped that this enterprise will prove remunerative, as the projectors deserve the fullest measure of success.

SPARTA.—*Badrock Democrat*, May 26: Dr. Jay Guy Lewis, Supt. of the Del Monte group of mines at Sparta, has been in the city for a couple of days. The Dr. brought over some fine samples of ore taken from his mines which the *Democrat* man had the pleasure of inspecting. These ores are high grade, are very rich in gold and silver, and are of a character easily worked. Dr. Lewis is highly pleased with the favorable outlook of the Del Monte, and intends to continue development work throughout the summer. Sparta will again be one of the liveliest mining camps in the great Inland Empire.

#### UTAH.

BULLION SHIPMENTS.—*Salt Lake Tribune*, June 1: The receipts in this city for the week ending May 30th, inclusive (the day named being a holiday, thus reducing the days to five for labor), were to the value of \$121,389.63, of which \$61,949.56 was bullion and \$59,440.07 was ore. For the previous week the receipts were \$45,327.93 in ore and \$71,024.71 in bullion, a total of \$116,352.64. The Ontario output for the week was of bullion, 24,470 fine ounces; ore sales, \$27,779.07; an approximate total of \$52,249.07. The daily product for the week was 9 bars of bullion, 12,298.85 fine ounces. The Horn Silver continues much, and it is probably doing something in a small way; whether enough to pay expenses and avoid an assessment on the stock is not known. Fine bar receipts for the week were to the value of \$36,767.85. The Hanauer smelter produced for the week \$15,625 in bullion; the Germania \$9556.71 in bullion. Ore receipts in this city for the week were to the value of \$27,779.07 by Wells, Fargo & Co.; \$26,150 by McCormick & Co., and \$5511 by T. R. Jones & Co.

### List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 270 Market St., S. F.

FOR WEEK ENDING MAY 29, 1888.

- 383,694.—HORSESHOE—J. E. and E. W. Bing-ham, Walla Walla, W. T.
- 383,700.—ANIMAL TRAP—J. Brusie, Oakland, Cal.
- 383,629.—TRANSPLANTING TOOL—T. R. Coon, Hood River, Ogn.
- 383,572.—HEATER FOR TEA, ETC.—C. W. Hell-eland, Salem, Ogn.
- 383,577.—MECHANICAL MOVEMENT—M. B. Kellogg, S. F.
- 383,531.—PRESERVING PILES—Chas. C. Lane, S. F.
- 383,736.—PRESERVING PILES—Chas. C. Lane, S. F.
- 383,818.—MAP AND CHART SUPPORT—W. H. Larew, Mariposa, Cal.
- 383,739.—FRUIT-STONING MACHINE—B. A. Lil-lie, S. F.
- 383,826.—AIR SUPPLY FOR PROPELLING CARS—L. C. Pressley, S. F.
- 383,510.—SCREEN—D. Wesemann, Los Angeles, Cal.
- 15,556.—TRADEMARK—F. M. Towne, San Ber-nardino, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

### Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ADJUSTABLE MAP AND CHART SUPPORT.—Wm. H. Larew, Mariposa, assignor of one-half to W. C. Reid. No. 383,818. Dated May 29, 1888. This appliance for schools consists of an adjustable frame and board serving as a map and chart support. It has its principal use in schools where children are to be instructed from blackboards, maps or charts, which, being of suitable size, would leave the work at varying distances from the eyes if they were suspended at a fixed point. By the use of this adjustable supporting device the different positions of the map or chart may be successively brought into the proper position for more easy and convenient inspection.

FRUIT-STONING MACHINE.—Benjamin A. Lillie, S. F. No. 383,739. Dated May 29, 1888. This is one of those machines in which are employed rotating cutters mounted in adjustable frames in such a way that when they seize the fruit between their cutting edges and carry it down between them, they may conform themselves to the size and shape of the pit against which they operate, and to which are also employed in connection with the cutters, knives or scrapers below for clearing the flesh of the fruit from the pit. This is an improvement on a former patent by the same inventor. It consists in certain improvements, consisting of novel adjustables opposing guides on each side of the rotating cutters, and adjustable knives in connection with the ordinary knives or scrapers.

ANIMAL TRAP.—James Brusie, Oakland, No. 383,700. Dated May 29, 1887. This is specially intended for a rabbit-trap. A cage of wire netting is made, and to prevent rabbits turning the ground within this inclosure, is covered with wire netting. All around the base of the cage are openings with doors. These doors are of transparent material, such as glass, and are hinged above so as to swing. Any suitable enticing material or food is placed within the cage. The rabbit sees what he deems an unguarded opening, the door being of glass, and therefore not noticed by him, he makes for the opening, and the door swinging inwardly, admits him, and under his original impulse he passes through into the cage. He cannot get out again for the doors do not swing outwardly. In order to insure the entrance of the rabbit, Mr. Brusie places within the cage, and just behind each door, a mirror, the location being such that upon discovering and approaching the supposed opening of the door, the rabbit cannot fail to see his image in the mirror. Surprised by this, he picks up his ears, and, his image doing likewise, he is the more impelled to enter the cage or inclosure; "in order," says the inventor, "to make the acquaintance of so close a companion, for though other rabbits might really be within sight, still the proximity and sympathetic actions of the reflected rabbit do more to create a sudden impulse toward the door than the confined real rabbits do." This trap can be easily carried from place to place. The wire netting can be rolled up as when first bought, into small compass, and the four posts, mirrors and doors are easily packed.

THE MINT CLEANUP.—Mr. Hirschberg, acting superintendent of the Mint, announces that the yearly cleanup will take place in June. The Mint will close on June 16th for the receipt of crude deposits, and on the 23d for fine deposits, and will not reopen again until July 9th.

# ATTENTION, GOLD MINERS!

WE ARE SELLING

## Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,  
At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.  
SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,  
E. G. DENNISTON, Proprietor. 653 & 655 Mission St., San Francisco, Cal.  
NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

MILL SUPPLIES AND LUBRICATING OILS.

## THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new work as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

## NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

## Mining Share Market.

The depression in mining shares still continues, notwithstanding the vigorous work now going on at the Comstock and other mines dealt in at the Boards. The following mining companies report cash on hand June 1st:

Consolidated California and Virginia, \$106,160 in cash and \$189,338 in unsold bullion; Confidence, \$154,265; Overman, \$29,618; California, \$1155; Bulwer Consolidated, \$382; Gould and Curry, \$13,749; Crown Point, \$24,516, with \$2602 to be collected on the pending assessment; Hale and Norcross, \$96,675; Ophir, \$4589; Andes, \$17,016; Sierra Nevada, \$23,340; Mono, \$20,975; Bodie Consolidated, \$31,674; Tioga Consolidated, \$19; Exchequer, \$13,090; Alpha Consolidated, \$17,426; Mexican, \$10,514; Julia Consolidated, \$1836; Syndicate, \$9970; Pondera, \$13; Found Treasure, \$1974; Peerless, \$23,357; Crocker, \$16,897; Weldon, \$4548; Consolidated Imperial, \$6294; Belcher, \$19,138; Bullion, \$13,512; North Belle Isle, \$40,000 in crude bullion unsold, with indebtedness of \$1798; Navajo, \$4070; Bulls Isle, \$9189; Independence, \$1987; Standard Consolidated on hand here and New York, \$52,016.

The following mining companies have had an indebtedness on June 1st: Best and Belcher, \$909; Mount Cory, \$49,120; Occidental Consolidated, \$3168; Segregated Belcher, \$24,318; Savage, \$42,357, less the value of 8926 ounces of fine silver on hand and other shipments to be received before the fiscal month closes; Potosi, \$54,673; Chollar, \$25,988, with shipment of bullion to be received before the fiscal month closes; Holmes, \$2033; Utah Consolidated, \$436, with an assessment now being collected; Locomotive, \$5987; Peer, \$209; Nevada Queen, \$22,708; Commonwealth, \$7026; Challenge Consolidated, \$13,347; Grand Prize, \$25,927; North Commonwealth, \$6373; Del Monte, \$5130; Diana, \$3817.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

RHODE ISLAND M. Co., June 2. Location, Arizona. Capital stock, \$500,000. Directors—Eugene R. Garber, Wm. Minto, L. M. Hoefler, Harry R. White and Chapman Leigh.

MARKET STREET BANK, June 2. Capital stock, \$100,000. Directors—S. E. Grove, Wm. F. Lewis, Worrie C. Lewis, C. P. Butler and A. B. Maynard.

COMMERCIAL ADVERTISING INDICATOR Co., June 5. Capital stock, \$500,000. Directors—Alvan E. Small, Albert W. Jacobs, Francis Jackson, James B. Mackie, Fred D. Brandon, Robert R. Schwell and Robert Jackson.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Eureka Con., June 4, \$17,100; Mt. Diablo, 3, \$4452; Con. California and Virginia, 3, \$85,121 (total to date for May account, \$274,460); Gould and Curry, 2, \$16,608; Hanauer, 1, \$4660; Silver Reef (for May), \$19,578; Germani, 2, \$4703; Hanauer, 2, \$2150; Richmond Con., 2, \$18,353; Savage, 5, \$40,000.

## San Francisco Metal Market.

## New York Metal Market.

Telegraphic advices dated June 7th give the following New York prices:

BAR SILVER—92c per oz.  
BORAX—9c.  
COPPER LAR—\$16@16.05.  
IRON—No. 1, \$22 00.  
LEAD—\$3.90@—.  
TIN—\$18.60@—.  
The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Dull, spot closing at \$16.60@16.70. Transferable Notices (Lake) issued at \$16.60@—.  
LEAD—Steady, at \$4.07 spot. Transferable Notices issued at \$4.10.  
TIN—Nominal at \$19.50@—.  
Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.  
Australian Tin, @—; Billiton Tin, @—;  
Banco Tin, @—; Baltimore Copper, \$14.60@15.40;  
Orford Copper, \$15.60@16.00; P. S. C. Copper, @—;  
Foreign Lead, \$4.60@4.75; Foreign Spelter, \$5.50@5.75; Antimony, \$10.50@14.00.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. O. H. LAMPADUS—Santa Barbara Co.  
G. W. INOARD—Arizona Territory.  
A. F. JEWETT—Tulare Co.  
C. E. WILLIAMS—Yuba and Sutter Co's.  
R. O. HUSTON—Montana Territory.  
W. M. WILKINSON—Butte and Tohama Co's.  
J. L. DOYLE—Kern Co.  
W. W. THEOBALDS—Contra Costa Co.

SEVERAL additional complaints have been sent to the Chief of Police concerning the operation of the Globe Patent Co. in this city. Eastern inventors had sent the company money in amounts from \$20 to \$60, in connection with the sale of their patents, and never heard of any results.

## DELINQUENT NOTICE.

## Butte Creek Hydraulic Mining Company.

Location of principal place of business, 213 Market St., San Francisco, Cal. Location of works, Butte county, California.

NOTICE—There are delinquent, upon the following described stock, on account of Assessment No. 12, levied on the 27th day of March, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.
J. D. Dexter, Tr.	48	100	5 00
J. D. Dexter, Tr.	48	100	5 00
J. D. Dexter, Tr.	49	100	6 00

Ed. Dexter, Tr.	50	500	\$ 25 00
Chas. Moss.....	92	500	25 00
B. Frank Moss.....	90	500	25 00

And in accordance with law, and an order of the Board of Directors, made on the 27th day of March, 1888, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 213 Market street, San Francisco, Cal, on Monday, the 28th day of May, 1888, at the hour of 1 o'clock P. M., of said day, to pay Delinquent Assessments thereon, together with costs of advertising and expenses of the sale.

LOUIS R. LEVY, Secretary.

OFFICE—213 Market St., San Francisco, Cal.

## POSTPONEMENT.

The above sale day is hereby postponed to MONDAY, June 11, 1888, at the same hour and place. By order of the Board of Directors.

LOUIS R. LEVY, Secy.

## MEETING NOTICE.

Office of the Alabama Mining Company, Corner of Fifth and Stevenson streets, San Francisco, California, May 12, 1888. Location of works, near Newcastle, Placer county, California.

NOTICE is hereby given to all the Stockholders of said Alabama Mining Company (a corporation) that there will be a general meeting of the Stockholders of said company held at the office of said company at the S. W. corner of Fifth and Stevenson streets, in the city of San Francisco, Cal., on Monday, the 11th day of June, A. D. 1888, at the hour of 1 o'clock P. M. of said day, for the purpose of removing from office the following named Directors of said company, to wit: Owen King, William Reinhold, Samuel Jones and Michael Hoffman, and for the further purpose of filling by election then and there the vacancies that may be caused in the Board of Directors by such removals.

The undersigned is the owner of more than two-thirds of the capital stock of said corporation, as well as a Director and President of said Company, and makes this call under the provisions of Section 310 of the Civil Code.

J. J. SMITH,

President of the Alabama Mining Company.

## Jewey &amp; Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.

No. 220 Market St. Elevator 12 Front St. S. F. Telephone No. 658.

A. T. DEWEY. W. B. EWER. GEO. H. STRONO.

## MINING MEN

## And the Public Generally!

## ELECTRIC DEVELOPMENT COMPANY.

### Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Trancars, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

**EDISON INCANDESCENT LIGHT,**

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

Portland, Or.

Sydney, N. S. W.

**PARKE & LACY,**

SAN FRANCISCO, CAL.

—IMPORTERS AND MANUFACTURERS OF—

## MACHINERY

ENGINES,

BOILERS,

STEAM

PUMPS.

GIANT ROCK BREAKER.

ROCK

BREAKERS,

PULVERIZERS,

CONCENTRATORS.

Westinghouse "Standard" and "Junior" Engines, Rock Drills and Air Compressors. Saw and Planing Mill Machinery, Machine Tools, Governors, Injectors, Oil Cups, and Lubricators.

## BELTING, OILS and GENERAL SUPPLIES.

We are prepared to give estimates for Hoisting Works and Pumping Plants, Stamp Mills, Smelters and Concentrators.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

## FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco  
 HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

### FOR SALE.

2 Triumph Concentrators.

1 New 12-inch, 35 H. P. Engine.

VERY CHEAP. Apply

130 Sansome St., room 1.

# \$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 50 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,  
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE  
"TRIUMPH" ORE CONCENTRATOR.

The present improved form of this celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 Fremont St.,

Sectional View of Pulverizer.

# PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.  
We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## The Pelton Water Wheel

Gives the highest efficiency of any Wheel made, and is the standard for high pressure service in all parts of the world. Over Five Hundred are in use on the Pacific Coast alone, running Quartz Mills, Hoisting and Pumping Works, Electric Plants for power and light, as well as for various manufacturing purposes.

They are adapted to any head of water from 20 feet up to 2000 feet. These Wheels are now coming largely into use in connection with Electrical Transmission, furnishing power which is carried long distances with but small loss.

## Square Smelting Furnaces.

All the furnaces at Leadville, Colorado, are built on the same general principles and contain the same essential parts, but they belong to two distinct styles—the rectangular or square and the circular. We give on this page an engraving of the square furnace, which we take from Emmons' U. S. Geological Survey Monogram on the Mining Industry of Leadville, having previously illustrated one of the circular furnaces. In the engraving Fig. 1 is an elevation; Fig. 2, horizontal sectional tuyeres; Fig. 3, vertical section through slag-gutter; Fig. 4, horizontal section at charging floor.

The general appearance of these furnaces is that represented in elevation, Fig. 1. The furnace is formed of two independent parts: (1) The masonry, *C*, supported on a main cast-iron plate support, *D*, resting on cast-iron pillars, *P*. (2) The crucible *A*, upon which rest the water-jackets, *B*. The space between the water-jackets and the masonry is filled up with fire-brick, *b*. The arrangement is most convenient for repairs of parts exposed to injury or destruction. It is universally adopted in the camp. The masonry is firmly bound by braces, *Q*, the system adopted for bracing varying with almost every furnace. Immediately above the feeding floor, *P'* are to be seen the feed-holes, *H*, provided with sliding doors, *S'*. The smelting charges are thrown into the furnace through these holes.

The different parts of the masonry are the following (see vertical section Fig. 3): *C* is the shaft of the furnace. The portion of the shaft immediately below the feed-holes is called the throat. It can also be seen in horizontal section in Fig. 4. *D* is the chimney and *E* the stack; this stack can be opened or closed by means of the damper *G*. The stack is also connected with the dust-condensing chambers by means of the sheet-iron flue *F'*. The walls of the furnace are represented by *C'*. The wall placed above the slag-gutter *U*, which is always considered the front part of the furnace, is called the front wall. The opposite wall, at the rear, is the back wall; on each side are the side walls in which apertures are provided for the feed-holes. A wooden hood *W* and chimney *W'* are placed in front of the furnace and above the slag-gutter to carry off the fumes from slags. The crucible *A* is formed of strong cast-iron plates *a*, firmly screwed and bolted together, and it is covered with a cast-iron plate. The crucible is lined with fire-brick or steep (brasque). In front of the crucible projects the fore-hearth *X*, to which is adapted the slag-gutter *U*. On one side of the crucible is placed the lead-pot *L*, communicating with the hearth or crucible *A'* (Figs. 1, 2 and 3) by means of the siphon *L'*.

This arrangement is called the syphon lap or automatic lap, and constitutes one of the greatest improvements ever introduced in the construction of blast furnaces, for, by its means, lead keeps always at the same level, and thus escapes as much as possible the oxidizing action of the blast. The lead pot is always inclosed in a cast or wrought-iron box or frame, *a'*, projecting outside of the crucible. The portion of the hearth designated by *A''* (Fig. 3) is the dam. *X'* is the steep of which the hearth, fore-hearth and lead-pot are made. In an article in another column of the PRESS will be found a decision of the United States Circuit Court establishing the validity of the patent

on this device which has been contested. Messrs. Keyes and Arents of San Francisco are the original inventors.

The water-jackets, *B*, constitute also one of the greatest improvements ever introduced in the construction of blast furnaces. When properly cared for they never get injured; occasionally they may get shifted or spring a

nares need important repairs. The sectional disposition admits of the expansion and contraction of this portion of the furnace without altering the relative position of the parts, and on this account must be highly commended.

In the furnace under description there are 12 jackets, called the front or breast jackets, two at the back and four on each side. In horizon-

pipe, *M*. In Leadville the tuyeres are never supplied with any special arrangement for cooling than by water, for the reason that the water-jackets act as coolers of the tuyeres. The tuyeres are generally made of thin galvanized iron, provided with sliding-valves, used to observe the interior of the furnace, and also as safety valves, for they are left partially opened. The front jackets are always provided with an open space, which is closed with a plug of capping clay. This plug is called the tympan-stone. The tap-hole is perforated through the tympan-stone for the exit of the molten slag.

## The Lead-Well Patent Valid.

In the Circuit Court of the United States at Denver, Justice Miller last week rendered a decision in the suit brought by W. S. Keyes and Albert Arents of this city against the Pueblo Smelting and Refining Co. of Colorado. The suit was brought for infringement of a patented improvement in smelting furnaces known as the lead-well or automatic tap, commonly called the siphon tap. The complainants sought to recover damages for the use of 13 furnaces for a period of six years, amounting, as claimed, to the sum of \$195,000, exclusive of the triple damages provided for by the patent laws. This case involved about the same principles as the suit by the same patentees against the Grant Smelter, which went to the Supreme Court of the United States, except that that was a suit at law and this is in chancery. This goes into the merits of the case.

Justice Miller's summing up of the case is quite extended. The gist of it is, however, given in the concluding sentences as follows:

"I will make an order that the patent is a valid patent; that the defendants have infringed it, and that the plaintiffs are entitled to an injunction and to compensation for its use. Reference to a master will be made to ascertain the compensation of the plaintiffs. These views settle the whole case."

This is one of the important California inventions which has been applied to metallurgy. It is used all over the United States where lead smelting is carried on. The defendants in the above case endeavored to show that Karsten's furnace anticipated it, but in this they were unsuccessful. Justin Miller is one of the best posted men on patent matters in the United States, and his decision is highly important. This will be a lesson to those persons who unlawfully use inventions without compensation to the patentees. Robt. E. Foot of Denver was the attorney for the California inventors.

SENATOR STEWART of Nevada is still pegging away at the lead ore proposition. He is determined to know whether or not it is, by any construction of the law, coming in free. He has presented a resolution instructing the Judiciary Committee to inquire and report whether under the Act of March 3, 1883, lead ore is exempt from duty if it shall contain gold greater in value than the value of the lead in the ore.

PAT. HENLEY and William Kelley were injured by an explosion at the St. Lawrence mine, Butte, M. T., Friday, and Kelly will probably lose his sight. The St. Lawrence is the mine in which a great cave occurred a few days ago, burying a number of miners, who were rescued with difficulty.

RECTANGULAR LEAD-SMELTING FURNACE.

leak between the joints, but this rarely affects the jackets themselves. It is sufficient to state that smelting campaigns of 13 months are known in Leadville, to give an idea of the importance of this arrangement.

The water-jackets, *B*, are hollow boxes, indicated in elevation, Fig. 1, and in section, Fig. 3. They are made of cast iron, wrought iron or steel boiler-plates. In the water-jackets water can circulate freely, so that the temperature of this portion of the furnace wall, when the most intense heat reigns in the interior, never exceeds 60° or 70° C. The water-jacket arrangement is always sectional, so as to afford every facility for the removal of the jackets when the fur-

tal section, Fig. 2, the manner in which they are formed is shown very clearly. The jackets are very firmly screwed, bolted and braced together. Each jacket is provided with one or more circular apertures for the introduction of the nozzles of the tuyeres. In Fig. 2 the arrangement and disposition of the tuyeres is plainly seen. Each jacket is provided with a cast-iron feeder, *R*, forming an integral portion of the jacket and cast with it for the introduction of water. Small pipes, *S*, screwed to the feeders, act as outlets for the hot water, which is carried away by the water-gutter, *T*. Cold water is introduced in the feeders by means of the taps, *Y*, supplied from the main water

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

## Murphys and Vicinity.

EDITORS PRESS:—The Mitchell placer mines of Vallecito are being put in shape for extensive work. The gravel in this district embraced in these mines is of unknown depth, and until now no plan has been put into operation to work these deposits, though many have been devised. It is a question if in the end it is not found necessary to tap this old river channel by a long tunnel from the Stanislaus river. That the gold is there and that in abundance has been repeatedly proven by the dirt washed from the deep shoals. If further proof were needed the shrewdness of three Italians on the adjoining Mansker ranch would convince the most skeptical. These Italians put down a shaft last fall; failing in their application for a mining patent, they applied to the owner of the ranch, Mr. Manaker, and secured the right to mine on the ground beneath the ranch. Once secure they showed pieces of gold weighing up in the ponds. One piece taken out the past week weighing 48 ounces, and this but one of many. Just what amount of gold they clean up is not known, as they only show an occasional piece to their friends. This gravel deposit extends from Vallecito to Murphys, is of an average width of a half-mile, and supposed to be between 100 to 300 feet deep.

The Central Hill hydraulic mines are the Murphys end of the Vallecito and Douglas deposit. McCormick & Bisbee are pushing the Central Hill property for all there is in it, and while they say but little, the general understanding is that the mines are paying handsomely, though laboring under the disadvantage of a poor dump. Once this old river is opened with a tunnel tapping it at the lowest point, the section will prove a perfect bonanza. In quartz, the work of this neighborhood partakes of development. On San Domingo, Mr. James Taylor is putting down an air shaft, and promises to show up "the biggest mine in the section by next fall." West of town the Mattison's are driving away to crosscut the Beatrice. Should the vein approach in richness anywhere near the owners' expectations, the Beatrice will be more than beatific; the ledge is large, and all the work done shows ore of very good quality. Further west Mr. Sublett, patient, persevering Sublett, is driving ahead on the same lead to strike a rich chute. If Sublett does not succeed, it will not be from want of trial, as he has put in eight years of faithful prospecting in that immediate neighborhood.

Southeast of town Messrs. Heard & Harris are sinking on the old Bavarian ledge, with good prospects. Just across the creek, Messrs. Dussell & Heindorff are quietly pounding out a big thing from pocket quartz. To the west of town, McPrage Bros. are sinking and milling rock from the old Black mine; across the gulch Strass & Stone are preparing to sink an additional 50 feet on one of their locations. A recent mill run on their mines shows the concentrates to average \$1400 to the ton. As the rock glistens with sulphurets, some idea can be formed of the possible future of these properties. Still further east are the mines of Goodwin, Dorsey & Mattison on the Stanislaus. As the hills hang out at the top in that section, the writer has not visited them lately. Reports have it that work is being pushed on all the mines. Should all the leads prove as valuable as the Snell—one of Senator Dorsey's group—the section will soon make a record. This, the Snell, is a four-foot ledge of \$35 free gold rock, very easily mined and milled, but is idle in consequence of the difference of opinion as to the values. Murphys is slow in "getting there," but once she "gets there," it will be to stay, and don't forget it.

E. H. SCHAEFFLE,

Murphys, Calaveras Co.

## A Wrinkle on Rock-Breakers.

EDITORS PRESS:—I presume that every one who has used the Blake style of rock-breaker to any extent have, at some time or other, found themselves in a predicament for want of a rubber spring—the one used to keep the vibrating jaw open.

I recently saw in Mexico, the land of make-shifts, a substitute for the rubber spring. It is simple and effective. The contrivance is a spring-rod attached to the rod (which has been lengthened for the purpose), to which the rubber spring is attached. When the rock-breaker is placed above a storage bin there is ample room to make the pole of sufficient length to give it a good spring.

E. C. VAN BLARCOM,  
Oakland, June 12, 1888.

## Como, Nevada.

EDITORS PRESS:—Como is able to toot her horn once more, and it is time you were hearing from us. After a period of inactivity of nearly a year's duration, the Eureka Como mine steamed up on the 27th ult. and blew her whistle, making the surrounding hills reverberate with the welcome sound.

This mine is under the management of a new company, and the name was changed from

Como Eureka to the present one. This company have spent about \$6000 during the past two months in machinery and repairs, and are now about ready to begin sinking their shaft deeper. They mean business, and before many months there will probably be a mining boom on at Como.

This district is known as Palmyra and Indian Springs mining district and contains several square miles of mineral ground. Population at present, about 25; elevation, 7600 feet. Should we continue to increase and prosper, you may hear from us again.

"CHROMO."

## New World District, Montana.

EDITORS PRESS:—The New World mining district, as it is called, is situated on the headwaters of the Stillwater, Clarke forks, 20 miles northeast from the east fork of the Yellowstone river, and four miles east from the east line of the National Park.

Cook City is our district-seat and postoffice, while Lexington, Montana, is our county-seat of Park county. The altitude of Cooke is about 7500 feet above sea level, while our mines range from 10,000 to 10,500.

A majority of the ore of the camp is galena and carbonate, yet we have some milling rock. Transportation has been our main obstacle; we are 60 miles from a railroad.

The present freight rates are \$20 per ton on incoming coke; the same on outgoing hullion, being equal to \$40 per ton on every ton of hullion that is shipped from the camp.

Outside of the transportation question our camp never looked more promising, but the present railroad view is very flattering for the near future.

To make mention of all of the prospects of the district would require too much space and time, so permit me to only name a few of the mines, giving the names and developing work done on each.

The Black Warrior lode has shaft No. 1 down 56 feet, all in ore; shaft No. 2 sunk something over 100 feet, all in ore connected by a tunnel; the extent of the ore body is not known. The ore is composed of galena and carbonate. The assay value samples about \$40 in silver and gold with a good percentage of lead.

The White Warrior lode has a tunnel of 250 feet on ore, tapping the ore vein at the depth of about 250 feet from the surface. This claim now has a three-foot solid vein of galena and carbonate and will sample \$50 in silver and gold with lead from 30 to 40 per cent.

The Keystone lode runs a 100-foot tunnel, tapping a three-foot vein at a depth of 75 feet from surface, thence drifted on vein 30 feet, and sunk at end of tunnel 20 feet. The ore at this point was the width of shaft. The ore is galena and carbonate, the value of which is unknown to the writer.

The Alice E lode has a tunnel of 60 feet in solid ore and shaft now down 20 feet in ore, the nature of which is decomposed honeycomb quartz, being milling rock. The ore in the tunnel samples \$10 in gold, while that from the shaft runs from \$40 to \$330 in gold and silver.

The Morning Star lode is represented by tunnel No. 1 of 160 feet, tapping it on vein something over 100 feet from the surface. They put in station at the end of tunnel and sunk a winze No. 1 of 50 feet, thence drifted 40 feet on ore; put in another station and sunk winze No. 2 50 feet on ore.

Winze No. 2 was sampled from top to bottom. Five assays were made which run from \$119 to \$195 in silver and gold and 40 per cent in lead. Tunnel No. 2 is now in 403 feet, tapping the cross vein at a depth of 260 feet from surface. The intention of tunnel No. 2 is to tap ore body under winze No. 2 and connect with same. Work is progressing as fast as time will admit. It would be safe to say the pay ore vein will average about three feet in width from grass roots the entire 260 feet. While the ore so far has been galena and carbonate, the last extracted showed a new feature and the owners think it the best ever taken out heretofore.

We have many other prospects which we would be glad to mention but will save for future reference.

JESSIE.

The working force of the San Francisco copper mine at Spenceville, Nevada county, has been increased. The new owners intend to improve on the property and will do a great deal more work in the future than in the past. New shafts will be sunk as soon as practicable, and several new buildings, necessary for the prosecution of the increased work and supply of ore, will be erected.

It is reported in Victoria, B. C., that a controlling interest in the Bearnest mine in Alaska has been finally transferred to an English company for \$1,500,000. Hamilton Smith of London and Henry Janin of New York left for Alaska by the last steamer in the interest of the purchasers.

THE PARADISE VALLEY MINE.—Very encouraging reports are received from the Paradise Valley mine. Ore is being found in new ground on several levels, and the indications are favorable for ore bodies similar to those heretofore worked, when the mine was paying dividends.

## The Expression of Our Movements.

(Continued from Issue of May 26th.)

[Translated for the Press from the French by M. N. M.]

Without undertaking to pass in review here all the characters that the walk can present, we resume what we have to say. The calmness, the regularity, the rectitude of the walk, indicates a nature temperate, mistress of itself, firm of will. Agitation, irregularity, uncertainty, are so many contrary indications.

We can apply the same observations to the transitory state in which the pedestrian finds himself. Walking in a direct line toward a person or thing manifests frankness, boldness, courage, confidence; the walk sideways or tortuous betrays fear, insincerity, hatred and treachery. Here again the symbolism is visible, almost literal; it materializes in a form and in a movement the state of sympathy or of antipathy, of expansion or of contraction, which compels the person to act. Moreover, it is not only in human beings that we observe that. Look at the wild animals in their mistrusts or in their wiles; observe the dog when he meditates a theft or an intention to bite; the cat that watches the mouse; notice the wolf, whose name has served to make the verb "loupoyer" (to tack) a word used to define the course of a ship which has not a favorable wind and which orients (trims) its sails upon the different angles in order to advance sideways, and expresses likewise in its metaphorical acceptance, the tortuous ways of attaining an end which one conceals without appearing to do so.

Accessory movements develop new effects. A timid man in walking will hold his arms almost immovable; a bully will turn them like the fans of a mill; another will roll his trunk upon his loins, will disjoint his shoulders, and he is said to hip himself in walking and to be ill-jointed.

We need go no further. These observations anticipate what we have to say of the gait. It will be proper to remark, however, that the slow, hesitating, spiritless walk indicates a feeble character, or a depressed condition like that of physical or mental suffering; that a quick, light walk is a sign of healthiness of the body or of cheerfulness of mind; and that the upright and sincere man walks straight forward, while the hypocrite, the man who fears, or dare not, glides sideways.

## As to Running.

Its accelerated nature restricts expression to sentiments sudden and very energetic. In the usual metaphorical language, in place of saying that one goes, it is said that one runs when the question is of an act done with ardor. "I run to give warning, I run to throw myself in his arms; to run to glory, to pleasure, etc." To run does not even always suffice, and in certain cases still more urgent, one says: "I fly to your feet; I fly to new combats," etc.

The depressive sentiments translate themselves also by the rapid run, but in this case it is to get out of the way of the object instead of to run toward it. Fear, as every one knows, gives legs to the greatest poltroon. I have, however, read in a work macaronic that running away implies even a certain degree of courage, because when one has overmuch fear the legs fail. The observation is very just, and it gives occasion to remark that the great emotions, when they exceed a certain measure, indefinitely abate the velocity of the walk, and that when they are sudden or excessive, they can arrest it entirely.

As collective action, the walk now regulated with reference to a certain rhythm now executed en masse, make part of the rites and ceremonies which are traits of manners peculiar to the human species. Religion, war, and the great events of life, are celebrated by walks of a solemn character. These manifestations approach elsewhere to the dance, of which we shall have to speak further, but we ought to indicate here the place to which they belong.

## The Gait.

If we properly observe to call things by their names, that of gait will apply only to the characteristic manner of walking considered as expressing such state or such sensibility as may be habitual to such person. It is habit, it is the persistent character of walking in such or such a manner that constitutes the gait. This is how in current language we are led to confound them, and this is what for us should serve to distinguish them. Nevertheless, we must admit that the distinction is a nice one to attend to, and one may slip at each step when one seeks to hold himself exactly upon the line of demarcation which separates them; that is seen above where we had to stop, because in speaking of the walk we began to encroach upon the gait.

As we were saying, pertinent to this, the walk, independently of qualities of amplitude, of rapidity, and of regularity, which are in some way the essential and purely mechanical part of it, is always accompanied by accessory movements, by dispositions, it may be of the head, it may be of the body, which accord with it, and which we are not able to detach in order to consider them apart, so that it is true to say there is no walk without gait. But it is precisely that ensemble which, when it comes to take an expression and an accent very clear and very significant, becomes the expressive action that we call gait. Look at the passers on the street; there are a lot of them who walk in the same manner; one goes fast, another slow;

that one walks with steps counted, this with strides unequal. The young skip; the head and eyes always in requisition and their arms beating the air like wings; the old and the diseased stoop the head, bend the back, let the arms hang down, drag the feet, and walk curved, like street-porters, under the weight of life. The healthy hasten on with an air of good humor, their heads thrown back, arms rounded, leg stretched forth, eyes brilliant, and month smiling. The wealthy walk in nearly the same manner, so that it is not always easy for physiognomists and philosophers to distinguish merely from the gait, whether the felicity of the happy man who goes by is the result of nature or good fortune.

## Sorrrows. Misfortunes, Hardships,

Travels, and wretchedness; everything that makes the burden and weariness of life impresses on the gait the same accent of dejection, of languor, of slowness, of ruin, as do age and disease. We find, moreover, the same signs that we have remarked in the human figure, in the case in which, under the action of a transient cause, it expresses suffering, or a depressive sentiment; but there is here this difference that the sign is henceforth ineffaceable; it has become incorporated, and like an arch broken under strains too violent, a person is no longer able to become straight again. Character in the gait manifests itself with no less of evidence than age, the state of health, or the conditions of life, according as it is open or concentrated, feeble or energetic, sincere or dissembling, sad or gay, indecisive or resolute, and translates in symbolical signs these various qualities, sometimes by the breadth, vigor, frankness, grace and precision of movement; at others by their meanness, effeminacy, want of grace and hesitation. With the exception of that which the mechanical and static necessities of the walk necessarily change in it, the gait may be considered as an attitude in a kind of particular movement, because in spite of these modifications we can say that for every one of the divers states of the soul, the gait and the attitude, save the movement of the legs, are similar; that is to say, that the parts of the visage and of the body execute the same movements. Thus, a proud man for example, a man irascible, and a timid one hold and move themselves in their gait in the same manner as they do in an attitude of repose, and pride, anger and timidity express themselves by the same signs in a man who has not habitually these defects, their bodies assuming the same disposition. There is no utility in extending these observations further. It will suffice to refer to what we have said of the various kinds of expressive movements to see that we can apply it with as much detail and precision, to the analysis and esthetic of the gait.

(To be Continued)

It is stated that the Humboldt and Mendocino Lumbermen Association has decided to shut down all mills for one week each month during the summer. The object, as stated, is to keep the supply down to the demand. The demand for lumber from the southern part of the State has fallen off materially. The mills that are closed are mostly in the redwood region. The mills that closed last week are the following: Humboldt Mill and Lumber Co., at North Fork; Chandler, Jackson & Co., North Fork; Minor, Kirk & Co., Warren Creek; and the Milford Land and Lumber Co.'s mill at Salmon Creek. Those which shut down this week are: Vance's, at Mad river; Minor's, at Glendale; Dolbeer & Carson, Eureka; Vance's, Eureka; Excelsior Redwood Co., Eureka; Occidental, Eureka; Elk River Mill and Lumber Co., Elk river; Wyman, Murphy & Co., Springsville, E. I. river; Valley Lumber Co., Newburg, and the Pacific Lumber Co., Scotia.

M. F. STANTON, amalgamator of the mill at Tybo, Nevada, was killed last week by being drawn into a settling pan. He was at work as usual, and was trying to adjust a nut on a set screw connected with a settling pan while the latter was revolving. He wore a large glove on his hand which caught in the gearing, and by that he was drawn into the pan and crushed between the arms or flange. The unfortunate man was immediately removed from his horrible position, and as tenderly cared for as circumstances would permit. As there was no physician at the place, Mr. Stanton was put into N. S. Trowbridge's spring wagon to be brought to Eureka, but he died on the road between Summit and Moore's stations at 11 o'clock the same night.

MINE SALARIES IN AUSTRALIA.—It is pretty well understood that the salary of W. H. Patton, who left the Comstock to take charge of the Broker Hill Proprietary Co. (limited) in New South Wales, is \$20,000 a year. It is stated that John Howell, late manager of the Reno reduction works, resigned his position to accept a similar position in Australia at a salary of \$10,000 a year. If the people in the Australian colonies continue to offer such salaries all the mining men on this coast will be looking out for berths over there.

THE people of Plymouth, Amador county, are beginning to think that the closing down of the Empire and Pacific mines, and no resumption of work, is for speculative purposes. The *Sentinel* says: "Many of our citizens doubt whether there has been any fire in the mines but what could have been extinguished at any time if the management had so wished."

## Bacon and Shakespeare in the Plays.

THE GREAT CRYPTOGRAM.—By IGNATIUS DONNELLY, R. S. Peale & Co., N. Y.; J. Dewing Co., S. F.

"Studiando le mie cifre con compasso,  
Rilevò che s'ero presto scitto i terzetti;  
Perche d'el mio sapir si ta gran chiasso,  
E gli ignoranti mi hanno mosso guerra."

Studying my ciphers with the compass,  
I find I shall be soon under the hiss;  
Because of my lore folks make such a rumpus  
That every dull dog is threat'ning unity.

FATHER PROUT.

Our readers may recollect that some months ago (Dec. 24th) we gave an extended criticism on "Bacon and Shakespeare in the Sonnets," a work which issued from the pen of an esteemed resident of this city. The advocates for Bacon's handiwork in the Shakespearean plays are steadily increasing in number and their intelligence is undisputed. None but a purblind critic can refuse to see in Mr. Donnelly's work the indication of what will be, when fully worked out, a secret history of Elizabethan times. The Baconians have not indorced the cypher with unconsidered acceptance; their claims are based on arguments and illustrations which are able and accurately set forth in the first half of Mr. Donnelly's book. Readers of it will be astonished at the accumulating evidence which on page after page will confront them, all pointing to Francis Bacon's authorship. Parallel thoughts, passages, expressions and even errors taken from his essays, letters, general works and common-place book (*Promus*, edited by Mrs. Pott) place the whole question on the highest literary footing—on one which can no longer be scorned, ridiculed or misrepresented.

It is, however, with the "cypher" that it is our purpose more particularly to deal. At a casual glance a Newton would fail to see through it, but if, with such information as Mr. Donnelly chooses to give us, we join a careful study of coincidences in the position of certain words, a conviction that the author of these plays so constructed them that in the Folio of 1623 certain definite numbers would give us certain definite words is beyond the possibility of a doubt.

Mr. Donnelly's attention was attracted by the peculiar numbering of the pages in Folio 1623, more particularly by those of the Histories; by the frequent occurrence of italicized words; by the meaningless bracketing, and more meaningless hyphenation (for instance, amooth—comforts—false). "Errors common to the time," says the unconvincible; "There with a purpose," says Donnelly, and he tells us to turn to page 53 of the Histories. Multiply 53 by 7, and we will find the 371st word is Bacon; 7 is the number of italicized words on page 53, and we read on page 52, opposite.

"And now I will unclasp a secrete booke  
And to your quicke conceiving discontents  
I'll read you matter, deepe and dangerous,  
As full of perill and adventurous spirit  
As to o'er-walk a current, roaring loud  
On the unsteadfast footing of a *Shpeare*."

Page 67, treated in the same manner, gives us St. Albans.

## Found Out.

If we multiply the last page in the 21 scene, i. e., page 76, by 11, the number of bracket words on the first column of page 74 (counting post-horse as two words), and count from the beginning of column 1, page 74, to the 836th word, it is *Found*. If we start from the top of the next page (75), and again count 836 words, we have *Out*. The first rule in counting Mr. Donnelly found to be "Exclude bracket words, and count hyphenated words as one word." (The words spoken by players alone are counted.) Any reasonable person can see very readily that a mode of counting which was to give uniform results could only be arrived at by changing the count by the addition of bracketed and hyphenated words; otherwise we would have but few words from an unvarying counting number, viz., up or down the column counting forward; up or down the column counting backward—just four words.

The bracketed and hyphenated words now come in; and that they are thus intentionally inserted we will see from the following remarkable coincidence. If we multiply page 75 by 12, the number of italicized words on first column of page 74 the result is 900, and counting 900 words including the bracket words and counting hyphenated as double words we again have the word *Found*. That is, going over the same ground, from the same starting point, and attending to brackets and hyphens gives us, with a number which includes them, the same word. Starting again at page 75 and counting 900 in the same manner, i. e., including bracketed words and counting hyphenated words as double, we reach the same word as before, *Out*.

This will help to explain to us what has given the critics some food for cavil, viz., "root numbers" and "modifiers," and we must here recollect that a scent so keen as that of her Majesty, Queen Elizabeth, was necessarily the occasion for great care and complexity in the construction of a cipher; her Royal laughter at Jack Falstaff's "quick wit and great belly" would soon have changed to Royal rage had she thought that *old* and *jade* would, with mathematical precision, unite by 7 different counts, and describe her to future ages as the "old jade."

\*The revelations which Mr. Donnelly makes are more than horse out by Judge Hogmer's interpretation of the Sonnets; a paper on their coincidences is in preparation by us.

Mr. Donnelly's fac simile pages of the plays Henry IV, pt. I and II, are marked on the margin with the number of words in fifties, and every tenth word is underlined in red ink. Bracketed and hyphenated words are also marginally recorded; counting is thus reduced from a tedious to a comfortable and fascinating process. This the public must do for themselves, as Mr. Henry A. Clapp, a noted Shakespearean critic, writes in the *Advertiser*: "It is almost certain that no competent (sic) critic will have the patience to follow it. . . . So that the world shall be able to know whether or not the author's solutions are verified by the first folio text of the first and second parts of Henry IV."

Now, as there are modifying numbers dependent upon words, brackets, and hyphens, there must be a number to modify; as a matter of fact there are several, and as these usually interlock in pairs, we thus see how complex the cipher may become. Mr. Donnelly does not tell us how he obtains these numbers which we are to modify; he calls them root numbers; but, as the reading of the cipher depends upon the paging, we ought to suspect that the root numbers would increase or decrease in a certain ratio dependent upon a certain numbered page, and he themselves modifications of one number. This, Mr. Donnelly hints, is the case, and he fears that some acute mind or minds may find it out and deprive him of some profit by finishing the work before him.

## Modifiers.

Part I, Henry IV concludes on page 73. Part II begins on page 74. There are two columns on each page. From these two pages all the numbers to modify with are obtained. Col. 1, page 73, is broken into three parts and contains 12 modifying numbers. (*Exits*, etc., break a column.) Col. 2 contains 8 modifying numbers. Col. 1, page 74, contains 5; and Col. 2 contains 3 parts and gives 12 modifying numbers, in addition to 7 others when we count in bracketed words and hyphenated words as double.

The number of words in a column, or in part of a column when it is broken, or the sum of two parts, form the modifying numbers, for instance:—"The first subdivision of the second column on page 74 contains 50 words; the second, 168; the third, 30; and the reader will observe hereafter how those figures, 50 and 30, play backward and forward through the cipher story, and he will see how the whole story of Shakespeare's life, as well as Marlowe's, radiates out from that central subdivision, containing 168 words, or 167, exclusive of the first word."

## Root Numbers.

The root numbers for so much of the story as Mr. Donnelly has worked out are 505 and 523; 513 and 516; 506. These are obtained, he informs us, by multiplying certain figures on page 73 by certain other figures on page 74 (we obtained 505 by adding to page 73 the number of words (23), in first subdivision of Col. 2 on same page, and then multiplying the resultant number by 5, the first group of bracketed words on Col. 1, page 74; and hope others will try and do better).

Thomas Davidson remarks that if we add the figures 1, 8, 11, 18 consecutively to 505, it curiously gives all Mr. Donnelly's root numbers. Another critic says 222 is the primal root number. In another play on which we are at work, 444 gives some extraordinary results. Another remarkable number is 888. I quote Mr. Donnelly: "Then I observed that if we multiplied 74 by 12 instead of 10 the result was 888, and if we commenced to count from the top of the first column of page 72, the result was 494, total on first column of page 72. This deducted from 888 leaves 394, which is the very significant word *plays*. Then I said to myself, volume of plays; do the multipliers of 74 alternate? Volume was reached by multiplying 74 by 10, the number of bracket words on the first column of page 74. Here we have 1, 2, 4, 8 mixed up with tens in a manner which considerably alters the series and may assist in fixing a ratio which will disclose the cipher numbers for other plays by modifying their various pagings."

## The Cipher Story.

It is here well to remark that some distance of time separated the production of Parts I and II, Henry IV, and also that the quartos (the first copies) were differently pagged and in many places differently worded from the folio of 1623. Bacon thus held the key in his own hand to save himself from being "hanged like a dog for the play of King Richard the Second," as he graphically expresses it in the cipher story; and Richard II was the first play which bore the name of Shakespeare.

The wildest critical shaft has been aimed at the impossibility of Bacon's knowing of the Hayward incident "before it occurred." Hayward was arrested in 1599; his confession is to be found in the State Paper Office. The second part of Henry IV appeared in 1600 or one year later, and it is in this part that we find the cipher story of Queen Elizabeth's beating Hayward. The paging of the folio 1623 alone reveals it. The quarto 1598 could by no manner of means be dragged into question by a careful critic, for was not the cipher already prepared? Was not the first part of Henry IV already published? And the story, when ready for telling, would it not naturally take its place in the next play?

The story radiates forward from the beginning of part II, backward from the end of part I. Space permits us to give but a short example of the regularity which will be found to

pervade many of the calculations. Five hundred and five, the root number, less 30 the modifier gives us 475; now counting upward from the beginning of the second subdivision of the first column of page 75, we find that there are 193 words, and counting downward there are 254 words. Let us take these alternately from 475 and they will give us the words on the following column (i. e., the 475th word from the starting point) according as we count up or down, counting brackets and hyphens (b and h) which are 15 in number, twice. Mr. Donnelly's system of notation is as follows:

Page and Word Cnt.	Page and Word Cnt.
505-30-475-193-282-15 b & h-267 up col + h-245 75.2 our	21 75.2 men
315-30-475-254-221...down column....	21 75.2 had
515-30-475-193-282-15 b & h-267 up col + h-245 75.2 had	28 75.2 and
515-30-475-254-221...down column....	23 75.2 the
505-30-475-193-282-15 b & h-267 up col + h-245 75.2 had	29 75.2 backs
505-30-475-193-282-15 b & h-267 up col + h-245 75.2 had	29 75.2 and

The word *their* is an example of another variation in the counting which may go backward from the end of the same scene. We have it here going backward from the end of scene 21, page 76; 49 is the number of words from the end of the scene to the bottom of the column. It must therefore be taken from 475, for the same reason that we took the numbers 193 and 254.

## Anne Hathaway.

The following is a description of Sweet Ann Hathaway from the cypher text. "She hath a pretty face and a fair complexion, with a high color and long red hair. She was a gross and vulgar woman, with a good heart, 'tis true, but a loud tongue and rough manners—a gossip with a giddy head, the model from which I draw Mistress Quickley." There are many instances, such as the following: The cipher narrative required a certain word, w'd, Bacon put it in the text, but *owned* is the word required for the making of sense in the play, and modern editions so have it. The names of Bacon's Uncle Burleigh and his cousin Cecil dare not, of course, appear in the plays. The uncle, therefore, is burly; and the cousin is seas-ill, a compound of two words; says-ill, or seas-ill. With regard to the description of Anne Hathaway, Mr. Donnelly says: "This is the only time *red* appears in this act, and it is found but twice besides in this play. And this is the only time *color* occurs in this act, and this is the only time *complexion* appears in this play, and it is found but four other times in the ten historical plays. And it is dragged in here by the heels. 'It discolors the complexion of my greatness,' says Prince Hal, 'to acknowledge that I am weary I and note how it is matched with fair.'" We verified the count and found both words in the same column; the same count giving them from the root number 505. We hope that those who have had the patience to follow us thus far will obtain the book and have the hardihood to judge of it for themselves. Mr. Donnelly pathetically and fairly says: "I am sorry to see that some persons seem to think that this whole question merely concerns myself, and that it is to be answered by sneers and personal abuse. I am the least part, the most insignificant part, of this whole matter. The question really is this: Is the voice of Francis Bacon again speaking in the world? Has the tongue which has been stilled for 260 years again been loosened, and is it about to fill the astonished globe with eloquence and melody?"

This has the true ring; it is an honest appeal to the judgment of his readers. The following is from the pen of the late Richard Grant White, who passed the bounds of fairness or justice in his unceremonious condemnation of Mrs. Pott's edition of the *Promus*: "The biographers of Shakespeare must record these facts, because the literary antiquaries have unearthed and brought them forward as new particulars of the life of Shakespeare. We hunger and we receive these husks; we open our mouths for food, and we break our teeth against these stones." Truly the man Bacon is slowly but surely replacing the myth Shakespeare of whom we read in the cipher narrative: "For I have sometimes seen him in his youth caper it about with a light heart, hallooing and singing by the hour and in the raggedest apparel and almost naked. A bold, forward rogue full of his own most beastly desires. A glutton rather overgreedy than choice, with his quick wit and his big belly weighing 200 pounds. He is extraordinarily fond of the bottle, but I must confess there was some humor in the villain; he hath a quick wit and a great belly, and indeed I made use of him with the assistance of my brother as the original model from which we draw the characters of Sir John Falstaff and Sir Toby. To see him caper with his great belly! It draws together to the playhouse yards such great mutters of people far beyond my hopes and expectations, that they took in at least 20,000 marks. It pleases Her Majesty much more than anything else in these plays. It seems indeed to grow in regard every day. It supplies my present needs for some little time. He was wise enough to save his groats and buy an estate of lordship. I heard that my lord, the German Minister, told Sayall that it was well worth coming all the long way to England to see this part of Sir John alone, in this play, and the Merry Wives of Windsor."

## Careless Critics.

To show how lamentably ignorant critics have proved themselves in even the simplest rule of counting, we adduce the following instance which any child of ten years can verify.

Mr. Donnelly says: "There are 447 words on the first column; if, now, he deducts ten from 447, the result is 437, but this is really not the tenth word counting from the bottom of the column; it is the *eleventh*." Mr. Clapp ridicules this sentence and compares it to Lord Duquerry's count of fingers—10, 9, 8, 7, 6 and 5 are 11. Let the reader take any short sentence at the bottom of a column; count the words (suppose there are 15), and if he does not find that the tenth word counting forward is the *sixth* counting backward, he will prove as blind as the critics who won't see. The 437th word is therefore the tenth + 1 = 11th from the bottom, when there are 447 words in the column.

## Arranging of Words.

"The words when found are arranged according to a certain rule." This rule Mr. Donnelly has not explained, and if he has perfected it he should have told us more about it. His greatest object, he says, is to show that there is a cipher in the plays; his other object appears to be the keeping, as much as possible, of the secret to himself; he has, strange to say, perfectly succeeded in both instances. Our endeavor has been to arrive at a fair estimate of his labors so far as he has submitted them to the public.

Four weeks of careful investigation have convinced us that Mr. Donnelly deserves much credit for accuracy in the literary portion of his work, and we here take the opportunity of thanking Mr. Deering of the Law Library for photocopies of the early quartos, and for a complete set of Bacon's works, Mr. Horace Wilson for the unretouched use of Staunton's photocopy of folio 1623, and Mr. Whittaker for a very complete set of books and pamphlets on the Bacon Shakespeare controversy.

The discovery of Bacon's authorship will be incalculably useful in clearing up many of the difficulties which are connected with the history of the doubtful plays. Beaumont did much dramatic writing. Who has not heard of "Beaumont and Fletcher," yet Beaumont lived to be only nineteen. Bacon was 20 when he entered Gray's Inn in the year 1580. The German critics have always maintained that there must have been *progressive stages* in the growth of Shakespeare's genius; the dates and facts connected with Bacon's life in great measure help us to solve the difficulty and point unerringly to the real Shakespeare.

*Errata*.—We take the opportunity of calling the attention of the readers of Mr. Donnelly's book to the following slight mistakes of the printer. They are easily corrected. Page 565, par. 3, line 4, for 81 read 86. *Facsimile* Henry IV, v. 75. col. 1, line 3, and col. 2, line 252, one hyphen has been omitted on the margin; page 78, col. 2, line 7, the word (almost) which is bracketed within brackets, counts as a word, this puts the red underline back 1 word under the 3, and makes no. of words in col. = 462. Page 699, line 30, read 10b = 2. Page 601. Diagram:—I goes up the 1st col. 2 goes down the 1st col. (making the dotted line like the letter S). Broken type:—*facsimile*, p. 76, col. 2, word 300—to.

Mr. Donnelly's labor has been very great, and we mention these errata in the spirit which leads Mr. Donnelly to say, "Help me to perfect it, rather than meet me as I have been met by insults and denunciations." We have read the work closely without finding any inaccuracies; more labor will make the counts appear more symmetrical.

WILLIAM GREGORY HODSON.

June 1, 1888.

**WARPING OF WOOD.**—It is said that the wood on the north side of a tree will not warp as much as that from the south side, and that if trees are sawn in planes that run east and west, as the tree stood, it will warp less than if cut in the opposite direction. However this may be, it is certain that the tendency to warp when sawn into boards is much greater in green than in dry wood, and that the convex side of the curve is always toward the heart. This warping, due to unequal shrinkage, and to the more open texture of the external portion of the tree, is not found to occur in the middle plank or board of the log, excepting as it may, in slight degree, reduce the breadth. This quality of not warping, which is in many cases absolutely indispensable for certain uses, as, for example, in the sounding boards of pianos, is secured in the case of spruce timber by first quartering the logs, and then sawing them with the angle downward. It is then sawed into boards very nearly at right angles with the line of annual growth, and a small triangular strip must be taken off to make the board square edged, but qualities of stability and strength are secured that could not otherwise be had.—*Mechanical and Milling News*.

ANOTHER survey is soon to be made by the Southern Pacific Company north from Los Angeles, it being the intention of the company to build a road which will be less expensive to operate than the present main line. The new line will leave the main track at a point about a mile south of the San Fernando tunnel, and will follow very closely the old emigrant wagon road through the Santa Susana range. The passes through these mountains will be effected at the Canyon de Laclis, and the road will run through the mineral land district and out into the Santa Clara valley. The object of this route is to avoid the San Fernando tunnel and loop on Mount Tehachapi.

THE backward spring has shown a marked effect on Alaska mining matters. Very little work has been done thus far this season.

THE International Congress of Anthropology, the first ever held in America, began its session at Columbia college this week.

## TABLE OF CONTENTS.

**EDITORIALS.**—The Lead-Well Patent Valid; Square Smelting Furnaces, 377. Passing Events; After Many Years; Bi-metallism in England; The Mining and Scientific Press; The Geological Survey of California, 380. Steam Schooners; "Fig. Won't Lie;" Hydraulic Pump for Gravel Mining, 381.

**ILLUSTRATIONS.**—Rectangular Lead Smelting Furnace, 377. Type of Steam Schooner Used in the Pacific Coasting Trade, 381. Black Sand Mining, 381.

**CORRESPONDENCE.**—Murphys and Vicinity; A Wrinkle on Rock Breakers; Como, Nevada; New World District, Montana, 378.

**MISCELLANEOUS.**—The Expression of Our Movements, 378. Bacon and Shakespeare in the Plays, 379.

**MECHANICAL PROGRESS.**—Viscosity Determination of Lubricants; Welding Soft Steel; New Apparatus for Transmitting Force; The Choice of an Engine; America vs. English Locomotives; Exact Working; Hardening Metallic Wheels; Spiral Springs, 382.

**SCIENTIFIC PROGRESS.**—Combustion and the Formation of Smoke; A New Sun Motor; Fluorine; Centrifugal Force; Dynamo Efficiency; Electric Firing for Rifles; An Electric Trumpet, 382.

**USEFUL INFORMATION.**—Utilizing the Tin Can; Bullets for Small Bore Rifles; A Substitute for Type Metal; To Perforate Earthenware; To Protect Clothing from Moths; Metallic Cement for Stone; Fastening Leather to Iron; To Stick Porcelain on Glass; Shade Your Lights, 383.

**GOOD HEALTH.**—How to Detect the Symptoms of Sewer Poison; The Temperature of the Skin; The Safest Way to Fall Down; California Climate; Cause and Cure of Writers' Cramp; Interesting to Everybody; Tongue Indications; Milk in Summer Time; Color Blindness Among Seamen, 383.

**ENGINEERING NOTES.**—The Panama Canal; Electrical Railroads; Growth of American Railways; The Zylinder Zee; Electric Lights, 383.

**MINING SUMMARY.**—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 384-85.

**MINING STOCK MARKET.**—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 388.

## Passing Events.

The discoveries in the Pajareto mountains, ten miles west of Nogales, A. T., are attracting considerable attention. Pack trains are commencing to bring in rich silver ore. A large area of country in the vicinity of the discovery has been located, and there are many prospectors and miners at work.

The men working in the coal mines and at the coke ovens at Wilkeson, Washington Territory, are having trouble. The mine and coke ovens have been shut down since the 1st inst. There is also labor trouble at the Roslyn mines in Kittitas county, on the line of the Northern Pacific.

The project to build a gigantic smelter at Tacoma has fallen through. The capitalist who was going to do the work has not the capital it was supposed he had.

The black sand region at Yakutat, Alaska has not panned out as rich as expected. The whole thing was a "sell," and a lot of disgusted miners have returned to Juneau. The black sand, worth at least \$40 to the ton, did not have 40 cents.

In mileage of new track laid this year, California takes the lead, 279 miles of railroad track having been added on 29 different lines in this State.

**THE LICK OBSERVATORY.**—We are unavoidably compelled to defer the Lick Observatory edition of the PRESS, which it was our intention to publish this week. It is our expectation to publish the description of the observatory in the PRESS of June 23d.

## After Many Years.

It is now just 30 years since vsin mining began first to be practiced in the State of Nevada, this industry having been preceded there, as in most of the Pacific States and Territories by an era of placer mining extending over a period of eight or ten years. While every section of the State has during these 30 years been explored and prospected in a hasty and superficial way, very little of it has been subjected to a close and careful examination, such as appears now to be going on in many parts of it.

That so little thorough work was done in the early day was due to the fact that the prospectors of that period being all in search of Comstock lodes, were not disposed to throw away their labor on such ordinary deposits as were constantly being encountered in the course of their explorations. Impelled by this purpose they hurried on from one mountain range to another, the whole country having in this precipitate manner been gotten over in an incredibly short time. Mining districts were laid out and organized by the scores, and claims taken up by the thousand, a very large percentage of the whole having afterward been practically abandoned.

The extent to which this business of locating claims was carried by these eager and rushing avant couriers is denoted by the proportions it reached in Western Nevada, more especially in the regions adjacent to the Comstock lode. Thus, there had been, prior to 1882, taken up and recorded in the Virginia district 3305, and in the Gold Hill district 7364 mining claims; this being aside from a good many claims located but never recorded. While these locations were for a given area much more numerous in the neighborhood of the Comstock lode than elsewhere in Nevada, still, when we come to extend the record over the whole State their entire number must have reached 25,000 or 30,000, and possibly a much higher figure. When it is considered that of these claims hardly more than one in a hundred has since been developed into a paying or even into a prospectively valuable property, the unsubstantial nature of this early prospecting business becomes amply apparent.

Clearly these pioneer prospectors performed their task with a haste little calculated to determine the mineral resources of the regions traversed by them. Surveying through the mountains without finding what they were in search of, the most of these adventurers left the country, some going to Utah, Idaho, Colorado or Montana, but more returning to California, whence they came.

This experience had in Nevada has hardly been paralleled in any other of these interior countries. As the pioneers in silver mining her people had everything to learn, and they had to learn it, too, under the most unfavorable conditions. They were not only novices in the business, but they suffered also from an absence of almost every facility for its successful prosecution.

During the period this new industry was being developed in Nevada the most of her neighbors were in bonanza working their placer mines, Idaho, Montana, Utah, Arizona and Colorado being all so engaged. About the time their placers were exhausted, the inhabitants of these countries, being ready to embark in silver mining, had all the knowledge and experience gained in Nevada to begin with, and if they have since been able to avoid some of the mistakes elsewhere committed, this may justly be attributed in part, at least, to the lessons taught them by their predecessors in the Sagebrush State.

While it is true that most of the early work in Nevada was done in the hasty and imperfect manner described, that performed in a few localities was of a more thorough and determined kind, yet hardly ever enough so to bring to light large and valuable bodies of ore or settle the question as to their probable existence. This was a work left for later times—for the men of to-day, who, crossing the tawny deserts, are once more invading the lonely and half-deserted mountains, disturbing their silence with the many sounds familiar in the active mining camp. All over the State, even in its remotest corners, this work of rehabilitation is going on—not very vigorously yet, except in a few districts, chiefly those lying along or adjacent to the railroads. Still there has been infused into many others enough of this new life to show

that a more general interest is being awakened in mining over there. That any sudden or very sharp revival of the business will occur is not anticipated. All that is promised or can reasonably be hoped for just now is the performance of such patient and more effective preliminary work as will serve to make patent the hidden wealth of the State and thus secure the capital required for rendering it practically available.

That Nevada abounds with mineral resources of almost every kind seems probable, her great stores of precious metals being established beyond question. Having by certain adventitious circumstances and events been forced to the rear, she has during all these years been kept there, even the fame of the Comstock having been insufficient to bring her to the front. Other mineral regions, in some respects more eligibly situated, have been liberally aided by capital while Nevada has so been neglected, this State in some minor particulars suffering by comparison with most of her neighbors. In none of these is the timber supply so limited as in Nevada, nor are any, with the exception of Utah and Arizona, so badly off for water.

So far as lumber is concerned, however, that, when railroads come to be multiplied and extended as they will be, can at moderate cost be obtained from the heavily wooded Sierra on the west, while the water supply can be greatly increased through the construction of reservoirs and recourses to artesian boring. In no event can a scarcity of either timber or water become an insuperable or even very formidable obstacle to the progress of mining in Nevada, while there is reason to believe that the era of more active exploration now likely to be inaugurated will ultimately, and perhaps very soon, settle the problem of her great mineral richness in the affirmative.

## Bi-metallism in England.

As is well known, gold has in great Britain for more than three-quarters of a century been the standard money of the realm. After holding such position for so long a time, it is not to be expected that a people so wedded to custom and so averse to change as are the English, will readily consent to see this metal displaced by or partially share its money function with silver.

That this will, however, be brought about in a very short time seems now highly probable. Concerned at the falling off in trade and the dullness in manufacturing and other branches of business, a Royal Commissioner was some time since appointed by the Government to inquire into the causes of such general decline and stagnation in these industries and interests. This Commissioner, among other things, found the monometallic standard to which England had so long adhered, to be one of the factors in producing the wide spread depression complained of.

This report led to the appointment a special Commission, charged with the duty of ascertaining to what extent the demonitization of silver had been instrumental in causing this untoward condition of affairs. This Commission, though it has for some months past been prosecuting its inquiries, has not yet made public its conclusions, if any have been reached.

Meantime, such has been the interest felt in the solution of this question that Bi-metallic Leagues have been formed in most of the larger cities and manufacturing districts of Great Britain; these leagues, comprising among their members a goodly percentage of the more prominent bankers, merchants, businessmen and manufacturers of the Kingdom, including also many heavy capitalists and members of Parliament. Holding frequent meetings and taking other effective means for the promulgation of their views, these organizations have succeeded in obtaining for them wide publicity, that endorsement by the commercial and manufacturing public having surpassed all expectation.

These leagues are now working to bring about an agreement between England, the United States, Germany and France for the restoration of the double standard. This effected, it is expected that all the other civilized nations of the world will readily adopt the same. This is by far the most widespread and influential movement yet made either in England or elsewhere, on behalf of the rehabilitation of silver, and may be hailed by the friends of the white metal as presaging an early and decided triumph for their cause.

## The Mining and Scientific Press.

Correspondence is received from all parts of the coast. This is specially useful to our readers, as the writers are generally practical men at work in mine, mill or shop, and their views are valuable. Through them we get at the condition of the various camps, and such news as does not elsewhere find its way into print.

The illustrations given weekly in our pages are mainly of new devices connected with mining metallurgy and mechanics. The numerous appliances invented from time to time are illustrated and described, with a view to keeping readers posted on all practical improvements.

The two pages, in solid fine type, of "mining summary," published every week in the MINING AND SCIENTIFIC PRESS, furnishes a current history of mining on this coast in a condensed, but comprehensive form. This is compiled with great care from a large number of publications printed in the various mining camps. It is arranged by State, county and district in such a form as to be readily examined by parties interested in any particular locality.

Every week is given a complete list of the United States patents granted for the week to Pacific Coast inventors. In addition we publish brief descriptions of such inventions as are of an interesting nature, and such as will be found useful to our Western localities.

The "Mining Shareholders' Directory" has a list of the meetings, dividends, and assessments of mining companies, with amounts, dates, names of officers, etc. Tables showing the prices of mining stocks, and highest and lowest values for the week are also given. The local markets and the New York metal markets are also published.

In the departments of "Mechanical Progress" and "Scientific Progress" it is aimed to present in condensed form such subject-matter as is appropriate to the titles. The "Good Health" column contains such hints and suggestions as are useful to people living in the mining camps, where such matters are not as generally attended to as they should be. The "Engineering" department deals with practical affairs applicable to this coast. The miscellany is carefully collected and gives information concerning new mining regions, the state of affairs and progress in old ones, and such general news as will interest miners. The PRESS also keeps track of what is going on at the local foundries and machine-shops, and the character of the work being done. All that is of general interest going on in our local scientific societies is recorded from time to time. The PRESS should be kept on file at every mine and in every mill, laboratory, library and workshop. It is the oldest mining paper in the United States, and the only one on this coast entirely devoted to mining and scientific matters.

## The Geological Survey of California.

The report on the work of the U. S. Geological Survey parties on the quicksilver mines of this State was completed in 1888 and the report is now being printed at Washington. It is expected that the publication will be issued in a short time.

For two years past the survey parties have been in the field working up the gold belt of California. A topographical party has been sent out from Washington each year for the last three years, and they have finished contour maps on a scale of two miles to the inch of a tract of territory reaching from Plumas to Amador county. As these maps are finished they are taken up by Mr. H. W. Turner and Waldemar Lindgren. These gentlemen have also been at work for three years making complete geological maps, special attention having been paid to the quartz mines.

This geological map is preparatory to a detailed investigation in all the quartz mines. The parties this year have been out since the 15th of March, and expect to be on the field until late in the fall. Mr. Lindgren is at work this season around Forest Hill and the Georgetown divide, and Mr. Turner is working in Tuolumne county. The maps will be published in sheets, each comprising half a degree of latitude by half a degree of longitude.

**TO TEST SPEED.**—The Harbor Commissioners are having prepared 12 piles of extraordinary length, to be placed in Mission Bay as mile-posts, so that the speed of vessels can be tested.

## Steam Schooners.

It is only within the past few years that auxiliary steam power has been given to the vessels engaged in the coasting trade in this part of the Pacific. Ever since lumber mills were first built in California, Oregon and Washington, the trade between the lumber ports and San Francisco has been carried on by the large fleet of sailing schooners. These schooners are built here, and are as fine types of their class as may be found in the world. They are made to carry very heavy cargoes (a large part of which is placed on deck) and intended to stand rough weather. The winds along the California coast are strong and the seas heavy during the summer months, and in winter there is apt to be a heavy gale now and then. For these reasons the schooners have to be built very strong and exceptionally sea-worthy, more especially as they are expected to carry such immense deck loads.

Within the past few years the lumber trade has increased very largely, a result due to the rapid settling up of the southern part of the State and the increase of population. The demand for lumber has exceeded the supply until quite recently. There was great haste to get cargoes, and vessels were scarce. The first

tion on this page. The vessels have broad beam and rather a flat floor, the dead-rise being inconsiderable. Most of the steam schooners are without bowsprits, but have plenty of sail to be handled with in case the machinery is out of order.

The coasting trade of late has fallen largely into the hands of this type of craft. For long coasting trips from Humboldt and Mendocino to San Pedro and San Diego these steam schooners are especially useful, for they get through the "calm straits" readily and are not delayed seriously by strong head-winds.

The engines used are compound, some of them triplex and even quadruple. The boilers are very heavy and made of steel. Though the coasting lumber trade has fallen off within the past month or so, it is only proportionate with relation to its extent for the past year or two. A number of new steam schooners are now on the stocks and the Fulton Iron Works have on hand several engines for these vessels.

## "Figures Won't Lie."

It is the fellows who use them that do the lying, as witness what M. de Varigny, a French statistician, has to say about the fortunes possessed by certain American millionaires, as

directory. An individual constituted like this Monsieur de Varigny ought to prove to the tax-payer of moderate means an acceptable person to perform the functions of county assessor, owing to his disposition to magnify the wealth of the rich.

## Hydraulic Pump for Gravel Mining.

John H. Martin of Oroville, Butte county, has just received through the MINING AND SCIENTIFIC PRESS a patent for an invention which relates, broadly, to hydraulic gravel mining, and particularly to a pump by which an excavation can be readily made in the sink or workings down to bedrock, preparatory to applying this ordinary hydraulic elevator. This pump is also adapted for use in river gravel mining, acting itself as an elevator. A half-interest in the invention has been assigned to Joshua Hendy of this city.

An elevator of the ordinary type, such as was patented by the same inventor in May, 1883, consists of a discharge pipe, the lower end of which is set down into an excavation in the workings, and the upper end is in communication with the flume or rests on the foot dam or top of the breast above. In the open lower end of this pipe is fitted the nozzle of the supply pipe

the supply pipe, and as the excavation caused by the operation of the gravel and the disposal of the material by the pump goes on, the discharge pipe automatically varies its inclination, its lower end sinking down, the joint at the nozzle permitting it, and the supply pipe itself being jointed, its sections change their inclination as the gravel washes out the stuff under and around them, so that the whole apparatus goes down as the excavation proceeds, and at the same time the material of said excavation is forced upwardly and carried away by the pump.

It will be seen therefore that the excavation is thus made of the necessary depth down to the bedrock without the ordinary digging and ordinary disposal of material. It is obvious that this pump may be considered an elevator itself, and may be used as such in river bottoms and other places, or may be used only for the purpose of pumping water out of the sink.

## Black Sand Mining.

It cannot be said that "black sand mining" on our ocean beaches has been by any means as successful as was expected of it. In the early days, when the Gold Bluff deposits in the northern coast of this State was first found, considerable gold was gleaned, it then being concentrated on the beach. But after the first rush there no very successful results were accomplished. All sorts of plans were tried to save the gold in the sands, but it is so very fine that it is difficult to save.

The deposits further inland were worked but no fortunes were made. There is so little difference in the specific gravity of the gold and the heavy sands that the ordinary appliances of gold mining are not effective. Every now and then we hear of a local excitement on this subject, somewhere along the coast, and some one is going to mine on a large scale; but a few months' work puts a stop to it. The big deposits on the Northern coast were to be worked on a large scale by a heavy company a year or so since, but the report of a skilled expert put a stop to the investment.

The Yakutat country, in Alaska, is the scene of the latest black-sand excitement. Lieut. Schwatka, while there in 1886, examined the deposits, and one of the party, Prof. Wm. Libby, carried a quantity of the sand East with him. Tests, however, showed there was not enough gold to pay. The cook of the Schwatka party, however, afterwards claimed to have found richer deposits, and confiding his secret (?) to others, a prospecting party was made up and went up there. They found sand worth \$4 to \$5 per ton. Then two of these men exhibited sand which, on assay, went from \$40 to \$60 per ton. This, of course, created an excitement, and a party started last January for the field, and after a very hard trip reached the place indicated. The Alaska Mining Record tells their story: "About 30 miles inland from Dry Bay they found some gravel and black sand, which they prospected quite thoroughly, but found nothing that would justify working. All the sand and gravel in that section contains a very limited quantity of gold, which will not yield to exceed 50 cents a day to the man. On the 17th of March they arrived at Dry Bay, at which place they employed some Indians, and started up the beach heading for Yakutat, where they arrived on the 24th. During the trip up the beach they came in contact with considerable quantities of black sand, which they prospected, but it failed to reveal anything except a few fine colors. After arriving at Yakutat they prospected the celebrated black sand island, over which all the excitement was created concerning that section, and found practically nothing. The party was justly indignant at those who circulated the reports of the fabulous mineral deposits said to exist on this island, and no terms of censure were too strong to be applied to them."

Another man who visited this deposit gave it a practical test, and says they cannot get over two cents a ton. This ends the last black sand excitement.

On the 12th inst. an injunction was granted in the Superior Court of Butte county by Judge Keyser, closing down a number of mines on Butte creek. This stream flows from the hills about five miles east of Chico. The suit against the miners was brought by farmers on the lower part of the stream.

TYPE OF STEAM SCHOONER USED IN THE PACIFIC COASTING TRADE.

schooners which had engines put into them as auxiliary were very successful in making quick trips and making money, and as a result a large number of the coasting vessels built of late have been given steam-power.

The prevailing winds are down the coast, and vessels going up in ballast from this or southern ports have to beat against strong winds. With steam, however, they make better and more certain passages, steaming directly up along the coast to their destination. Coming back with cargoes they can use their sails alone, or use both steam and sail combined. When at the "chute landings" along the coast, at the mills, where there is little protection, the steam-power enables them to get away at short notice and to make their landings with more certainty and safety.

We give on this page an engraving showing the type of steam schooner now being built. The Fulton Iron Works of this city have made a specialty of marine engines for this class of vessel, and we have described several of their engines in recent numbers of the PRESS. It will be seen from the design that the machinery is kept as compact as possible, so that no more space than necessary will be taken up. The deck-houses, too, are carefully designed to give as much cargo space on deck as may be. The fore-castle is forward in the usual place. Some of the vessels are now built with two tiers of deck-houses, so as to give room to carry passengers when necessary.

The form of hull is shown in the midship sec-

tion on this page. The vessels have broad beam and rather a flat floor, the dead-rise being inconsiderable. Most of the steam schooners are without bowsprits, but have plenty of sail to be handled with in case the machinery is out of order.

The coasting trade of late has fallen largely into the hands of this type of craft. For long coasting trips from Humboldt and Mendocino to San Pedro and San Diego these steam schooners are especially useful, for they get through the "calm straits" readily and are not delayed seriously by strong head-winds.

The engines used are compound, some of them triplex and even quadruple. The boilers are very heavy and made of steel. Though the coasting lumber trade has fallen off within the past month or so, it is only proportionate with relation to its extent for the past year or two. A number of new steam schooners are now on the stocks and the Fulton Iron Works have on hand several engines for these vessels.

Measured by his deserts, John P. Jones ought to be worth the large sum stated, but doubtless the worthy Senator from Nevada would gladly share with his Galician friend all that the latter could show him to be honestly worth over a couple of millions or such a matter. If a hundred millions may be set down to John Jones, presumably John Smith should be credited with a like amount, or, say for all the John Smiths in the State, the trifle of 20 billions or thereabouts.

The man possessed of not more than a beggarly million, would, we may suppose, be regarded by citizen Varigny so despicably poor that he would hardly look for his name in the city

by which the water under pressure is directed into the inclined discharge pipe, the water serving to force the material up through the discharge pipe, this material being first washed down into the excavation by means of the hydraulic giant throwing a heavy stream on the surrounding workings. In ordinary cases, the excavation for the elevator must be dug in the usual manner, and throwing up and disposing of the material and water which accumulate, by shovels, wheelbarrows and ordinary pumps.

This new invention has for its object the provision of a pump which is so constructed as to make and clear its own excavation, and which can also be used in river-mining, as it will raise the water and gravel high enough to run through flumes and gold-saving devices. The invention consists essentially in a discharge pipe to be set at an inclination with its lower end in the workings, a nozzle so jointed to the lower open end of the discharge pipe as to permit said pipe to change its inclination, and a sectional supply pipe with movable or flexible joints connected with the nozzle and supplying water under pressure.

In operating this pump, it is properly set in the first place. A gravel of ordinary kind is then used to disintegrate the material in the workings directly under and around the lower end of the discharge pipe. This material finds its way into the open lower end of the discharge pipe, and is thence forced on up by the water under pressure directed by the nozzle of

## MECHANICAL PROGRESS.

## Viscosity Determination of Lubricants.

A paper of considerable interest was read at the recent May meeting of the American Society of Mechanical Engineers, on "The Mechanical Significance of Viscosity Determination of Lubricants." Several forms of instruments—"viscosimeters"—for determining this property, were described, one of which has recently been designed for the use of the Standard Oil Co. This instrument consisted of a bath of water, in which is held a vessel capable of holding four ounces of oil. The lower end of this vessel has an outlet about one-sixteenth inch in diameter, so adjusted as to be completely surrounded by the water-bath as possible. A small piece of glass is set into the lower part of the oil vessel, and the water-bath is of glass, so that as the level of oil falls it finally comes into view, and the time of the flow of the oil can be made to determine at the instant when the oil reaches a line drawn at a particular point on the glass portion of the oil vessel. The temperature of the water-bath is adjusted by condensing steam in it. The oil vessel is filled to a desired point, and the time is noted which allows the oil to drop to the mark previously mentioned.

In testing oils, the interval in seconds, which is the degree of viscosity which the oil possesses, is recorded.

Another form of viscosimeter consisted of a cylindrical vessel in a proper heating bath, fitted with a piston. The vessel being filled with oil, the piston is drawn up until an eye in its rod is above the upper of two cross wires. The bath being at the proper temperature, the piston is released and begins to sink. When the eye passes the upper wire time is noted with a stop-watch, and the latter is stopped as the eye passes the lower wire. This interval of time is taken as the measure of viscosity. Both the cylinder and the piston are of glass. The piston is about 2-1000 inch less in diameter than the cylinder. The cylinder is made with all the accuracy of bore that the highest optical talent can afford. This apparatus is so sensitive in its action that the viscosity of illuminating oils can be distinguished by its use. Its designer, Mr. C. M. Perkins of the Atlantic refinery, Philadelphia, has successfully applied the instrument to the explanation of the difference of illuminating effect of various kindred petroleum products which it is impossible to investigate with viscosimeters of the jet type on account of their far less sensitiveness.

Mr. J. E. Denton, who read the paper, then submitted a table showing comparative results for given oils obtained by the use of the different viscosimeters. From these figures Mr. Denton concluded that the possible saving in the oil consumption necessary for minimum wearing away of the rubbing surfaces, due to the difference in viscosity, proves that the most economical lubricant is the oil of the greatest viscosity which will permit the oil to be fed, wherever the loss of power in friction is an element of inferior importance, as is the case in all heavy machinery.

## Welding Soft Steel.

Mr. Wailes states, before the British Iron and Steel Institute, that, in his experience, the very soft and pure basic open-hearth steel does not need the excessive mechanical compression that ordinary steel does, and consequently smaller and less-expensive blooming-mills will be required to break it down; and as the steel has remarkably good welding capacity, the writer can readily see how this may be true. The writer has lately been squarely controverted in his statement that soft steel may be easily and safely welded, in a paper before the American Society of Civil Engineers by Mr. William Metcalf, and he therefore wishes to be very conservative and cautious in the face of the judgment and experience of such an eminent engineer.

However, he feels it but just to the facts in the case to say that soft basic open-hearth steel sticks together with a great deal of tenacity when properly hammered together at a comparatively high heat, and the forging kept up until the metal has been considerably reduced in temperature, in a manner which very much resembles welds, and the metal, when pulled or otherwise broken apart, does not lack in ductility or show fiery crystals. It has been claimed before the British Iron and Steel Institute that soft basic steel can be easily fattigotted, bloomed and welded into scrap bars, which are sound and possess all the qualities of that original steel, and President Adamson, in his annual address, in May, 1887, said that he personally had a considerable record of the free welding properties of mild steel, and that at his works they were doing it successfully every day, and that he had found the steel must answer the following requirements: "That the carbon must be low, the manganese four times as much as the carbon, and that the silicon, phosphorus and sulphur combined must not exceed one-tenth of one per cent."—*American Machinist*.

NEW APPARATUS FOR TRANSMITTING FORCE.—A French engineering professor, M. Raymond Snyers of the Luvain University, has invented an apparatus for transmitting force between bodies moving at greatly varying velocities

without accompanying disadvantage of a violent collision. The method consists in furnishing the contact surface with steel brushes, which, by the entanglement of their "bristles," are enabled to grip one another. In this way the swiftest motion may be imparted gradually to a perfectly stationary body and a maximum of shock can be arranged which can never be exceeded, be the impelling force and velocity what they may. The inventor has in view chiefly the requirements of quickly moving lifts, railway trains and other bodies moving at high speed and with great momentum; and if it be possible to produce in this way an effective brake, or to obtain an automatic working of railway signals, much will be done to minimize some of the most serious perils which at present threaten life and limb to industrious occupations.—*Chicago News*.

## The Choice of an Engine.

Any type of steam engine can be employed in the arts and manufactures. The choice between them is therefore to be determined by circumstances; the motion which is to be transmitted, the work to be done, the fuel to be used, the arrangements of the shops, the resources of the owner, etc. If delicate machinery is to be driven, such as spinning-machines, instrument-making machines or electric apparatus, the engine should be run very evenly and be provided with every appliance for the maintenance of regular circular motion. But if the engine is to be used for hoisting or work of a kindred nature, it must possess a reversing gear also, so that it may be run in either direction.

Again, if an engine is used only as a motor for rough work, it will need none of the delicacy of adjustment that the first one called for; it now needs only to be simple, solid and easily handled, and it must not be liable to be injured in its own action by dust or shocks to which it will be subjected. In localities where fuel is dear and water abundant, a condenser should be used and the engine worked with as great a degree of expansion as possible; the heating surfaces and the grate should be large. On the other hand, where water is scarce and fuel is cheap, a high-pressure engine should be taken, the condensers dispensed with and the boilers provided with the best of steam-generating appliances. In this case the engine should be horizontal, with a heavy frame, well built foundation, and acting upon a shaft as near the ground as convenient; but if space must be economized, a vertical engine may be used, though it will be necessary to have all parts of extra weight. It would be possible to go on multiplying cases almost indefinitely, all of which would only serve to show that there is no absolute rule by which the best type of engine is established, and that, however excellent service any particular system might render in a given case, the results in another case might be poor.—*Power*.

AMERICAN vs. ENGLISH LOCOMOTIVES.—Much has been said of late, in both English and American journals, in regard to the comparative merits of American and English locomotives. This discussion has lately been taken up with considerable spirit between our English cotemporary, *Engineering*, and several Canadian and English engineers. In Canada, some of the locomotives are imported from England, and many from the United States, consequently Canadian engineers have excellent opportunities of judging of the comparative merits of the machines from actual experience with both under the same conditions. The natural result is that they favor the American design, and the amusing feature of the discussion comes in from the fact that the Englishmen, knowing almost nothing about the American engines, and constantly revealing that fact in their communications, yet persist in their efforts to convince their colonial compatriots that the American locomotive is all wrong, and that the mother country is the only proper place to look for locomotives—efforts which seem to result in absolute failure.

EXACT WORKING.—The day has passed by when a variation of a sixteenth of an inch is allowed in interchangeable work, even where as much variation would do no harm. If the gate is left open a little for the calf, it will soon be pushed open wide enough for the cow, and then the whole herd will get through. At the watch factories the measurements are in millionths, and at the gun factories and other shops, where close work is done, they are taken in the inflexible rigidity of a steel gauge.

HARDENING METALLIC WHEELS.—To give a greater solidity and density to the metal for wheels, it has been suggested, while the casting is cooling, to give it a rapid rotary movement near the edge, where it will ultimately work most. The centrifugal force gives the desired result, in pressing the liquid metal against the outer parts. This process, used in England by Mr. Webb, some years ago, has lately been put in practice in a Pittsburg foundry.

SPIRAL SPRINGS.—One of the rules for spiral springs, when made of round steel, is to multiply the cube of the diameter of the steel wire in inches by the amount that it is to be deflected for each coil, and this product by 75,000; then divide by the diameter of the spring, measuring from the center of the wire, and the quotient will be the force exerted in pounds.

## SCIENTIFIC PROGRESS.

## Combustion and the Formation of Smoke.

When fresh coal is placed on a fire in an open grate smoke arises immediately, and the cause of this smoke is not far to seek, as it will be easily understood that before the fresh coals were put upon the fire within the grate, the glowing coals radiated their heat and warmed the air above and thereby enabled the rising gases to at once combine with the warmed air to produce combustion; but when the fresh coals are placed upon the fire, they absorb the heat and the air above remains cold.

By gases is meant the gases arising from coals while on or near the fire, and it may not be known to everyone that we do not burn coals, oils, tallow or wood, but only gases arising from them. This can be made clear by the lighting of a candle, which will afford the information required. By lighting the candle, fire is set to the wick, which, by its warmth, melts a small quantity of tallow directly absorbed by the capillary tubes of the wick, and thereby so very finely and thinly distributed that the burning wick has heat enough to be absorbed by the small quantity of dissolved tallow to form the same into gases, and these gases burning, combined with the oxygen in the atmosphere, give the light of the candle. A similar process is going on in all other materials; but coal contains already about 17 per cent in gases, which liberate themselves as soon as they get a little warm. The smaller the coal, the more rapidly will the gases be liberated, so that in many cases only part of the gases is consumed.

But the volatile gases from coal cannot combine with cold air and produce combustion. Hence combustion takes place in the following ways: The cold air, in the act of combination, absorbs a part of the warmth of the rising gases, which they cannot spare and therefore must condense, so that small particles are formed which aggregate and are called smoke, and, when collected, produce soot; but as long as these particles and gases are floating, they cannot burn or produce combustion, as they are surrounded by a thin film of carbonic acid. It is only when collected and this acid driven off that they are consumed.

It has now been shown that cold is the cause of smoke, which may be greatly reduced by care. In the open fire-grate the existing fire ought to be drawn to the front of the grate and the fresh coal placed behind, or in the back of the fire. The fire in the front will then burn more rapidly, warm the air above, and prepare the rising gases for combustion. In this way smoke is diminished, as the gases from the coals at the back rise much more slowly than when placed upon the fire and the air partly warmed.

## A New Sun Motor.

Attempts have frequently been made by Captain Ericsson and others to turn to account the energy of the solar rays. All these inventors, however, have worked with steam which only evaporates under practicable pressures at comparatively high temperatures, and to attain these it has been necessary to concentrate the sun's rays with mirrors. According to *Engineering*, M. Ch. Tellier, however, by making use of another working fluid, has succeeded in dispensing with these cumbersome and costly appliances. His engine is worked with ammonia gas, the solubility of which in water varies enormously with the temperature. Thus at 32° F. one volume of water will dissolve about 1000 volumes of gas, but at 140° F., a temperature which is frequently attained in the tropics, the amount dissolved is extremely small, hence a comparatively small range of temperature will place at his disposal large quantities of this gas under pressure. In carrying out this idea in practice the ammoniacal solution is contained in a generator exposed to the sun's rays, which, heating the solution, causes the gas to be evolved under pressure, and this is then led off to the cylinder of an engine. After doing its work here the gas is passed into a kind of condenser, where it meets with water taken from the generator through a worm surrounded by cold water, and in this way has had its temperature reduced, rendering it capable of reabsorbing the gas exhausted from the engine, after which the whole is pumped back into the generator to begin a fresh cycle.

This apparatus has been worked with a certain amount of success at Paris during the summer of last year, but the atmospheric conditions are said to have been very unfavorable, so that, though the heat-absorbing surface had an area of 215 square feet, the work done was only 43,360 foot-pounds per hour.

FLUORINE.—THE UNIVERSAL SOLVENT.—The *Mechanic and Builder* in alluding to the recent discovery of a mode for isolating fluorine says: "Fluorine is not a newly discovered substance. It has been known to exist for half a century or more; but it is only quite lately that it has been obtained in the free or elemental state. It is true that it is a most energetic solvent, if we use the word in its popular significance to indicate that it attacks substances with which it is brought in contact by combining with them to form compounds. This is the reason why it so long defied all efforts to isolate it, since as rapidly as it was formed in the free

state it immediately seized upon adjacent substances and entered into new compounds with them. It has been found that fluorine will vigorously attack any known substance except the fluorides (which, being already compounds of itself, are indifferent to it) and carbon. The chemist who succeeded in separating it only developed small quantities at a time—sufficient to identify it and study its properties. His vessels were so rapidly corroded by it that it was impossible to operate on more than small quantities at a time, and no means have yet been devised to preserve it. It may be possible to do so in vessels of fluor spar."

## Centrifugal Force.

What Shakespeare Wrote of this Great Law.

The following is from the lecture delivered recently at the Royal Institution, London, by Sir William Grove, F. R. S.: "What is commonly called centrifugal force does not come from nothing; it depends upon the law that a body falling by the influence of attraction, not upon, but near to, the attracting body, whirls around the latter, describing one of the curves known as conic sections. Hence a meteorite may become a planet or satellite (one was supposed to have become so to this earth, but I believe the observations have not been verified), or it may go off in a parabola as comets do; or, again, this centrifugal force may be generated by the gradual accretion of nebulous matter into solid masses falling nearer to or being thrown off from the central nucleus, the two forces, centrifugal and centripetal, being antagonistic to each other, and the relative movements being continuous, but probably not perpetual. Our solar system is also kept in its place by the antagonism of the surrounding bodies of the Cosmos pulling at us. Suppose half of the stars we see, *i. e.*, all on one side of the meridian line, were removed, what would become of our solar system? It would drift away to the side where attraction still existed, and there would be a wreck of matter and a crash of worlds. It is very little known that Shakespeare was acquainted with this pulling force. He says, by the month of Oressida:

But the strong base and budding of my love  
Is as the very center of the earth  
Drawing all things to it.

A very accurate description of the law of gravitation, so far as this earth is concerned, and written nearly a century before Newton's time."—*St. Louis Globe-Democrat*.

DYNAMO EFFICIENCY.—Mr. R. W. Blackwell, in an article in a recent number of the *Electrical Engineer* of London has the following on dynamo efficiency: "The dynamo-electric machine, by which the power of the steam engine is converted into electricity, has reached a degree of perfection unappreciated by those not engaged in the business. Less than five years ago the best dynamos gave an efficiency of 75 per cent; there was an excessive heating of the wire coils, and of the journals, so that a machine could rarely be depended upon for a run of 12 to 18 hours at a stretch. There were frequent burnings out of the armature, and of the commutator, and other recurring faults, which caused uncertainty and expense. At present the best manufacturers sell their machines, both dynamos and motors, with a guaranteed efficiency of 90 per cent, so that for every 100-horse power of the steam engine, 90 will appear on the line in electricity, and 81 will appear in the motor in the form of mechanical energy. The latest series of tests made with railway motors demonstrated an efficiency of 80 per cent from the steam engine to the car axles. From this must be deducted, in actual practice, 5 per cent for the line wire, and 10 per cent for contingencies of all kinds, leaving 65 per cent actually to be relied on. Therefore, from 100-horse power at the engine, 65 will be delivered on the car axle."

ELECTRIC FIRING FOR RIFLES.—A recent invention in gunnery is the use of electricity in place of the percussion lock, the battery being situated in the stock of the rifle, and the spark furnished by means of a primary coil in a manner similar to the portable gaslighters, which, as is well known, when used with chloride of silver dry battery, will stand a use of 35,000 times without recharging. It is claimed that this use of electricity as a detonator will make it possible to use the high explosives in rifles, and in this respect it may be claimed to form as great an improvement over the percussion lock as was the latter over the flint lock. This topic formed the subject of a paper by Captain S. A. Day, before the American Institute of New York, in which he gave the most favorable opinion of the possibilities of this new method of firing rifles.

AN ELECTRIC TRUMPET.—An electric trumpet has been recently devised by M. Zigang. It consists, says the *London Electrical Review*, of a short brass tube mounted on wood, and containing an electro-magnet whose ends face a vibrating plate, on which is fixed a small piece of soft iron. Against the plate-armature rests a regulating screw with platinum point, which serves for automatic interruption, by vibration of the armature. With two Leclanche elements a musical sound is obtained, which may be varied in pitch, intensity, and timbre by means of the screw. This instrument may be usefully employed in signalling on ships, railways, tramways, etc.; it may also serve as a receiver for signals of the Morse type.

## USEFUL INFORMATION.

**UTILIZING THE TIN CAN.**—Probably no one article has been put to such a variety of uses as the tin can. A woman up in Maine has found a new use for them, and she tells, in the *Levi-ton Journal*, how those too good to throw away she utilized: "I learned to use them for brown bread when touting out at the seashore where dishes were scarce and cans plenty, and I liked them so well that I kept up the practice after coming home, especially after finding out that four of them just laid in my steamer. But this is not all the uses I find for them. In a few weeks my kitchen will be decorated with old salt-boxes each filled with as many cans, minus the bottoms, as will stand up in it, each can filled with good garden soil and each of these tin pots holding a tomato, dahlia, or other plant. I find it easier to transplant without disturbing the roots when the plants are so treated, and having no bottoms, the cans do not hold water enough to spoil the roots, as might be the case were they used separately. Sometimes I have sunk in the soil in the garden, near a plant that needed a good deal of water, an old can with a hole or two punched in the bottom to help it to leak, and then filled this can with water each night or morning. I also found this a good chance to add fertilizers by putting them in the water. John likes the cans to put around the trunks of young fruit trees. He says he has saved enough trees from the mice in this way to pay for all the canned tomatoes, corn, and peaches we have eaten. He takes off the bottom, cuts open one side, fits them around the stem, and draws the sides together again, and then pushes them down so that an inch or two is below the surface of the soil. The pieces of tins straightened out have also done duty as scarecrows, dustpans, and several other things in an emergency."

**BULLETS FOR SMALL BORE RIFLES.**—A series of experiments have lately been carried out in Austria on the projectiles for small bore rifles. Three varieties of bullets were used, namely, balls of hardened lead, of lead with a steel jacket, and of lead with a nickel jacket. In the experiments on penetration, copper-coated bullets were also employed. The rifles used were the Kropatschek and the Nagant. The first is of .315-inch caliber and is rifled with four grooves, making one turn in 35 caliber; its barrel is about 2 feet 8½ inches long, the weapon weighing slightly over 10½ pounds. The Nagant is of the same calibre, but is rifled with six grooves with a pitch of 31 calibers. The barrel is of the same length as the Kropatschek, but the weapon weighs rather less, or about 8.84 pounds. The bullets were tested with regard to accuracy of fire, penetration, and on the effect of prolonged fire, and in all these respects the jacketed bullets took the first place. In particular, by the rapid fouling which occurred with the hardened lead ball, the accuracy of the weapon was rapidly spoiled, which did not occur with the other projectiles. As regards penetration, the best results were given by the steel-coated ball, though the difference between it and the one with the nickel jacket was never very great, both bullets giving results greatly superior to those obtained with the hardened lead balls. The rifles were in no cases injured by prolonged firing of any of the projectiles.

**A SUBSTITUTE FOR TYPE METAL.**—The attempts hitherto made to substitute other material than type metal for the manufacture of type, stereotype molds, borders, reglets, etc., have been mostly attended with serious disadvantages. For example, the use of glass type was soon abandoned because it was too brittle and did not retain the ink efficiently, the printing consequently being indistinct and blurred. The latest innovation, however, is that of Meers, F. Kammsn of Vienna-Neustadt, who uses an artificial stone. It is claimed that this stone can be readily molded and is cheap; it is hard, yet sufficiently elastic to bear any great pressure without injury, whilst the type molded from it will readily take up, retain and give off the ink. For large type letters the substitute is stated to be especially suitable. The manufacture is as follows: Finely powdered silicic acids (kieseläuren) of greater or less degree of purity are intimately mixed with a small quantity of hydraulic lime; fluid silicate of soda (kieseläuren natrium) is poured over the mixture and is kneaded until it becomes a uniform plastic mass, which is then pressed into suitable molds, or the mixture can be poured in a fluid state into the molds. When the mass has hardened, it is then taken out of the molds and dried.

**TO PERFORATE EARTHENWARE.**—The *Scientific American* gives the following method of perforating earthenware: "A soft copper rod or pipe is used in the lathe, it being fed with a mixture of powdered emery and linseed oil. The emery is imbedded in the copper by the friction, and cuts right through the hardest material in a very short time."

**TO PROTECT CLOTHING FROM MOTHS.**—It is doubtful if there is any known reliable and unobjectionable means of protecting clothing from the moth, excepting that of tightly inclosing it in some material not subject to the ravages of this insect. I have had clothing badly moth eaten while kept in a bureau made wholly of red cedar, but have never known the moth to

enter a tightly-tied sack of cotton cloth. For the preservation of an overcoat, for example, through the summer, the following is recommended: Take a piece of unbleached cotton sheeting, 45 inches wide and about 10 inches longer than the coat; fold lengthwise and sew the side and one end, thus forming a sack 10 inches longer than the coat and 22½ inches in width. Thoroughly brush the coat, and hang it up by a stout cord 6 or 8 inches in length, passed through the usual tape on the inside of the collar. While thus suspended, draw the sack upward over the coat, gather the upper end of the sack closely around the suspending cord, and tie tightly with another cord. Let the coat hang until needed for use. When taken out, it will be found free not only from ravages of the moth, but from dust and wrinkles also.—*Manufacturer and Builder.*

**METALLIC CEMENT FOR STONE.**—The restoration of some of the most important stone structures in Paris, such as the colonnade of the Louvre, of the Pont Neuf, and of the Conservatoire des Arts et Metiers, has been mainly accomplished by means of a metallic cement invented by Prof. Buene. It consists of a powder and a liquid, the first composed of two parts by weight of oxide of zinc, two of crushed limestone and one of crushed grit, the whole intimately mixed and ground, other in suitable proportions being added as a coloring matter; the liquid employed consists of a saturated solution of zinc in commercial hydrochloric acid, to which is added a part by weight of hydrochlorate of ammonia, equal to one-sixth that of the dissolved zinc, and this liquid is diluted with two-thirds of its bulk of water. One pound of powder is mixed with 2½ pints of liquid.

**FASTENING LEATHER TO IRON.**—The following, on the authority of Dr. Heinichen of Dresden, it is said, will fasten leather to iron or steel so firmly that they can not be separated: Soak the leather with a warm solution of gall-nuts, spread thinly over the metal a solution of the best glue (hot), place the two together with a pressure on them, and leave to dry.

**TO STICK PORCELAIN ON GLASS.**—Good cement for sticking porcelain letters on glass: Starch, 60 parts; finely pulverized chalk, 100 parts. Mix with equal parts of water and alcohol, with the addition of 30 parts of Venice turpentine, taking care to agitate the mass with a stick so as to insure its homogeneity.

**SHADE YOUR LIGHTS.**—At the general meeting of the American Gaslight Association, Dr. Morton, the well-known physicist, warned people against the use of unscreened electric and gas lights. Lights should be placed above the visual range shaded so as to produce a diffused and equable light.

## GOOD HEALTH.

**HOW TO DETECT THE SYMPTOMS OF SEWER POISON.**—How shall one know when he is poisoned by sewer gas? is a question frequently asked. Dr. Hun, in the *Medical News*, says that he has carefully studied 29 cases, and thinks it probable that the following condition may result from sewer-gas poisoning: Vomiting and purging, either separately or combined; a form of kidney trouble; debility, in some cases in which the heart is especially involved; fever, which is frequently accompanied by chills; sore throats, which is frequently of diphtheritic character; neuralgia. These conditions may occur separately, but are frequently combined, and it is especially common for the fever to be associated with the other forms of sewer gas poisoning. Finally, in cases of sewer gas poisoning, there is one group of systems which is almost always prominent, and these symptoms are loss of appetite, drowsiness, extreme prostration, and a dull, unpleasant feeling in the head; and whenever this group of symptoms occurs, not as the result of an attack of acute disease, but as a chronic condition, a suspicion is justified that the patient is exposed to sewer gas infection. More or less satisfactory evidence has been adduced that the following diseases may result from sewer gas poisoning: Zymotic diseases, such as typhoid fever, pneumonia, diphtheria, cholera, dysentery, cerebrospinal meningitis, erysipelas, and scarlet fever; a condition of apyrexia which, in its severe form, is characterized by coma, convulsions and collapse; puerperal fever, abscesses, lymphadenitis, and possibly acute aural catarrh.

**THE TEMPERATURE OF THE SKIN.**—The experiments of Davy long ago demonstrated irrefutably that the temperature of the interior of the body varied little in man with race, climate or season; yet it is familiar to all that the temperature of the skin varies considerably in different parts—the extremities for example, and those parts of the skin where the circulation is feeble being cooler than other parts. Quite recently some interesting experiments to determine these variations of the surface have been made by Professor Kunkel at Würzburg. Taking the skin of the face in the first instance, he finds that in men from 20 to 30 years of age it varies from 85° to 89° Fah., with an approximate average of 88°. The skin of the more exposed parts of the body, as the tip of the nose and the lobules of the ear, in which the circulation is slow and feeble, exhibited a lower tem-

perature, not exceeding in many instances 75°, or even descending as low as 71.5°. The skin covering the muscular portion of the body is warmer than that over the bones and tendons. Contraction of the muscles caused the temperature of the superficial portion of skin to rise one degree or more. The decrease of temperature from the skin to the outer covering in a room at a temperature of 63° was as follows: On the skin 88°, on the linen shirt 82°, on the vest 75°, and on the coat 72°. The highest temperature was found to occur in men in the full vigor of life. As a singular fact, Dr. Knobel states that children otherwise in perfect health showed a much lower degree of surface temperature—from 77° to 84°—than adults. He does not appear to have followed out Professor Lombard's observations on the temperature of the head.

**THE SAFEST WAY TO FALL DOWN.**—"The special providence that seems to hover over drunken men and children has something of an explanation," said a well-known and eminent medical man to a reporter, "in the fact of the main cause of the breakage of bones from falls being from a resistance of the tendons more often than from the violence of the shock incident to the actual fall. A child or an intoxicated person will rarely endeavor with any great effort to recover their balance when they slip or topple over. Hence no special resisting force is exercised, and they sink into a collapsed heap without serious injury. When an adult in possession of his full sound senses undertakes with endless contortions and gyrations to save himself from going down, he draws every muscle and sinew taut, and if the wrench is too severe the bone breaks. There is no way of definitely proving it, but it is asserted, and I believe with some degree of truth, that some, at least, of the fractures resulting from falls, especially from a height, happen before the actual shock with the substance one falls on occurs. It's strange, but I guess it is the truth."

**CALIFORNIA CLIMATE.**—The complaint is sometimes made by Eastern people that the average of human life in California is not as great as it is in the Atlantic States. If that is so—which we doubt—it may be explained by the fact that great numbers of invalids come to this State, by which their death rate is unnaturally increased; and again, people do not take the same care of themselves here that they do East. If men do not reach the average of life here it is also in part because they abuse themselves in various ways here as they do not in the East. They work too hard. Our "glorious climate" gives them strength beyond that usual in other places, and they do not perceive it until they have overtaken themselves in labor or in the pursuit of business. Moreover, a large portion of our people live too high, drink too much, go to excess on tobacco, and in every other thing in which people can exceed the limit prudence would dictate. The graveyards are not peopled by middle aged and young men because of climatic conditions.

**CAUSE AND CURE OF WRITERS' CRAMP.**—The affection known as writers' cramps is not confined to users of the pen, but appears in telegraphers and others, who make continual use of one set of muscles. These cramps have been variously supposed to result from a diseased condition of the brain, spinal cord or nerves, and were long regarded as incurable. During several years past, however, Wolff has been applying gymnastics combined with massage to the muscles affected, and has succeeded in curing more than half of the many cases treated. His process is neither difficult nor tedious, being simply regular movements of the fingers or other parts, with rubbing or gentle striking of the muscles, continued not more than an hour a day for several weeks.

**INTERESTING TO EVERYBODY.**—The feet can be kept warmer in cold weather by wearing a shoe with a light sole than a thick one. With the former the shoe has a chance to work, thereby keeping up a circulation. This, of course, applies only when the weather is dry; but when it is wet, and rubbers are necessary, it is best to wear a single-soled shoe inside. In the summer the thick sole should be worn, for it keeps the heat from striking through to the foot. This is all so contrary to the preconceived opinions of the public that it is doubted whether it will receive much credence, but it is the fact all the same.—*Shoe and Leather Reporter.*

**TONGUE INDICATIONS.**—According to Dr. Howship Dickinson, a furred tongue is not necessarily an alarming symptom. To some persons it is normal to have a clean tongue, and to others equally normal to have a coated tongue, so that it is impossible to fix any degree or limit of coating as a necessary accompaniment to perfect health.

**MILK IN SUMMER TIME.**—An argument against allowing children to drink milk in the summer time is drawn by Dr. V. C. Vaughn of the University of Michigan, from the liability of the fluid to develop the poison—tyrotoxin—which is supposed to be the immediate cause of summer diarrhoea.

**COLOR-BLINDNESS AMONG SEAMEN.**—The fact has been noted that seamen, as a rule, are peculiarly subject to color-blindness. In tests made in the British mercantile marine, standard green was pronounced red in 107 cases out of 189.

## ENGINEERING NOTES.

## The Panama Canal.

De Lesseps' wonderful perseverance and almost sublime audacity, says the *Mexican Financier*, still retain for him the loyalty and confidence of a great army of friends in France and not a few in the United States. It is believed by some of the American contractors at the canal that it will be open to navigation, by the lock system, in 1890. By succeeding to a change of plans which permits the postponement of the sea-level canal for a time, we think that the Great Frenchman showed his practical wisdom. He has made it possible to regard the completion of a water-route across the Isthmus of Panama as a probability—not merely a vague and distant possibility. The great ironworker, Eiffel of Paris, who is building the huge tower for the exposition of next year, has taken the contract for the locks, eight in number, at the canal, and this indicates on his part a reasonable degree of confidence in the completion of the stupendous work with which the French people have linked their name. The locks, which are already being constructed, are not designed to be a permanent feature, but are adopted through the necessities of completing the works and opening up the canal within the required time. The building of these locks requires the outlay of prodigious sums of money. The locks number 10, and are located five on the Pacific side and five on the Atlantic side of the isthmus. The general width of the canal proper is a very small fraction over 61 feet.

The sanction of the French Chamber of Deputies for the lottery scheme has finally been announced, and it is thought that this measure will furnish all the funds needed to complete the work beyond that now in sight. This sum is now estimated at \$70,000,000.

**ELECTRICAL RAILROADS.**—An examination of electrical railroad statistics shows that there are 130 miles of road in operation on this continent. Of this number of miles 21 are in operation in the State of Pennsylvania, 16 in the State of New York, 10 in Ohio and 83 miles in other States. Almost all of this building has been done in the past year. On these various roads, constructed and constructing, in 62 different towns and cities, the Van Duesen system is used or to be used in 17 cases, the Daff system in 15 cases, the Sprague system in 7 cases and the Bentley-Knight, the Heart, the Henry, the Julien and other systems in the remaining cases. The last-named system is to be used on the projected New York and Harlem Fourth Avenue electrical railroad.

**GROWTH OF AMERICAN RAILWAYS.**—The evolution of the railway and of its rolling stock follows the same laws which govern the rest of the world; adaptation to circumstances decides what is fittest, and that alone survives. The scrap-heap of a great railway tells its own story. Our railways have now reached a development which is wonderful. The railway of the United States, if placed continuously, would reach more than half way to the moon. Their bridges alone would reach from New York to Liverpool. Notwithstanding the number of accidents that we read of in daily papers, statistics show that less persons are killed annually on the railway than are killed annually by falling out of windows.

**THE ZUYDER ZEE.**—There has been considerable talk of late of reclaiming the Zuyder Zee, and now it is said that a fund is being raised in Holland to defray the expenses of a survey of the same with a view to its drainage. This sea was formed in 1282 by the breaking of land barriers and engulfed 72 villages. It is proposed to dam the entrances, and pump out the present sea, leaving a small lake connected by a canal with Amsterdam.

**ELECTRIC LIGHTS.**—It is said that the Westinghouse Electric Co. has just completed an incandescent lamp which will give much better results than heretofore placed upon the market. Formerly a lamp which burned 400 hours was considered good. That figure was soon doubled, but the new Westinghouse lamp, it is claimed, will burn from 2500 to 3000 hours.

**SILVER IN BELLS.**—A correspondent of the *English Mechanic* says: "I once asked a foreman in a well-known bell-foundry whether putting silver in a melting-pot was of advantage. He replied: 'Of great advantage—to the founder, as the silver sinks to the bottom; the founder pours off the copper and tin, and when the silver has cooled, puts it in his pocket!' It may be that a bell made entirely of silver would sound well; but this is mere conjecture."

**A STEM WINDING SCREWDRIVER** has been made in Philadelphia, with the handle in two parts, said parts being capable of rotating one upon the other. A stop-pin and pawl limit the movement of the shank in one direction, while the top of the handle will move backward without turning the shank. The mechanism appears to be very similar to the principle of a stem-winding watch.

**WOOD PULP VS. PLASTER OF PARIS.**—Wood pulp is rapidly being substituted for plaster of Paris in the manufacture of all kinds of building ornaments in France, where a new method has been devised.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**CLEANUP.**—Amador Ledger, June 9: The Volcano Gold Gravel Mining Co. made a thorough cleanup on their claim in Volcano basin. The bullion was sent to San Francisco this week. The amount of the cleanup we have not heard, but it is the general opinion that the operations this season turned out much better than last year, as the ground worked was considered far richer than any heretofore mined by the company.

**STOPPED WORK.**—Work on the Gillick mine, near Volcano, has come to a standstill. This property was recently bought by San Francisco parties, who started in to open it up in good shape. When sold, the mine showed every promise of paying, but it seems the prospects did not hold out, and the company concluded to quit. This is a severe blow for that mining section. It was thought that the Gillick was likely to lead to renewed interest in quartz mining in that region, and that it should prove otherwise is bitterly disappointing. The 1st of June passed without any attempt being made to open the Plymouth Con. mine at Plymouth. Nobody seems to have any definite idea as to when the mine will be opened. Timbers are being received at the mines, but they were mostly, if not all, contracted for before the fire broke out. The stock is selling in New York at from \$9 to \$10 per share.

**PLYMOUTH.**—Cor. Amador Ledger, June 9: There is not much change in the mining outlook since our last letter. The New London is hard at work. The Plymouth Con. is doing nothing but hoist water, with a prospect of having that recreation stopped, as the shaft is closing together, so that the skip moves up and down with difficulty. A. M. Vaughn has got the Lady Bedford mine shaft cleaned out and retimbered as far as the old sinking went. Some very rich quartz was brought up, from the bottom.

**SUTTER CREEK.**—Cor. Amador Ledger, June 9: G. W. Horn, who has been expected here for the last two months to start up the Mahoney, has arrived. The first consideration is the motive power to run the machinery. It is the intention to run everything by electricity. They propose to go to New York ranch, a distance of six miles, where they can get water-power almost free. The laying of the wire will entail an expense of between \$3000 and \$4000, but when once in position the expense of running will be comparatively trifling. It is intended to start the mill the first thing, so as to get some income from the property, while the surface improvements are being made. They will run on surface dirt until the shaft is placed in working order.

#### Calaveras.

**THE CONFIDENCE.**—Angels Echo, June 6: The Confidence mine, located a short distance southwest of the Utica, is rapidly taking its place among the leading mines of this section. Two shafts are being sunk, one of which is now over 100 feet in depth and all the way down in good ore. A drift will soon be commenced which from present indications will develop even a larger body of ore than has yet been found. The other shaft, which is somewhat south of the first mentioned, is down about 20 feet and the lode is fully seven feet in width and constantly increasing as depth is attained. A ten-stamp mill is now in course of construction and will probably be completed in the course of a month or two. Only five stamps will be used for some time to come. The others will be held in reserve until the further development of the mine. The Confidence is no doubt a continuation of the famous Crystal lead and is therefore a valuable property.

**NEVILLS.**—Work is steadily progressing on the Nevills mine in this town, and everything is running smoothly as usual. In the course of a few days sinking will be commenced in the main shaft at the 400-foot level. This mine is under the management of men who thoroughly understand how to conduct it to the best advantage.

**UTICA.**—The new shaft on the Utica mine is being sunk rapidly. The mill was started up the other day and is now running steadily. Forty stamps are soon to be added to the 20 already running. Besides, we are told that other and more extensive works are to be erected.

#### Fresno.

**FANCHER CREEK.**—Cor. Fresno Expositor, June 8: A large and well defined vein of copper and silver-bearing ore have been discovered at Fancher Creek. A number of tons of ore have been extracted, and is now on the dump awaiting shipment to Oakland to be smelted. The parties owning this mine are employing several miners, and are both sinking and drifting. They are paid \$125 per ton for the ore as fast as they can put it on the dump. Messrs. Freitch, Jensen and Ninnis have discovered and made two locations with our District Recorder, on a copper and silver-bearing lode on Big Dry creek, about a mile from Budge's store. Although they have not developed their mine to a very great extent as yet, they have shown enough to induce them to commence running a tunnel. We were at the mine and saw a pile of very fine-looking ore; in fact, with the exception of a little soil from the very surface, all they had taken out of their prospect holes was ore—and good ore at that. Messrs. Gross and Ball had a very unfortunate cave in their tunnel last week, which will prevent them from working in the face for a while, but they are making good headway in repairing the break. The Peterson Bros. are pushing their tunnel on the Valley View mine, and expect to connect with their upper shaft shortly. Work is going on in the Confidence mine with the usual vigor. The foot-wall drift is being rapidly pushed ahead, and there is a day and a night shift working. For lack of water they have shut down the mill for the season. Messrs. Wyatt & Co. are working their mine on Fancher creek.

#### Inyo.

**TIN ORE DISCOVERED.**—Inyo Independent, June 9: In the Inyo mountains, a short distance from Independence station, is a large vein or ledge that miners have often looked at, but as it shows no evidence of carrying gold or silver, no one has ever tried to do anything with it. A few days ago Mr.

A. J. Davis examined some of the ore, and as it closely resembled tin ore he had seen elsewhere he assayed for that metal. The result of the assay led him to believe that the ore carries tin, and plenty of it. Samples have been sent for assay to various places. If the ore shall be found to contain tin in paying quantities there is a large ledge and it is very easy of access.

**NEW LEDGE.**—Mr. Hannigan came in from Panamint last Wednesday. He had been prospecting and found the best looking ledge yet discovered in the district. The vein is six feet wide for a distance of at least 1200 feet, and has been prospected to a depth of 11 feet. The ore is galena and carbonate. The carbonate carries 182 ounces of silver per ton and 67 per cent lead; the galena carries 70 per cent lead and 46 ounces silver per ton. The claim is six miles northwest from the town of Panamint and five miles northeast from Hot Spring. There are other parties interested with Mr. Hannigan, and the mine is likely to be worked without delay.

**MILL.**—Mr. J. C. Eddy of Darwin has been over at Panamint recently. It is understood that the object of his visit was to settle the question whether or not he should put up a mill there. It is reported that he has decided to build a mill, or move one from another place during the summer.

#### Mariposa.

**MOUNT RAYMOND MINES.**—Mariposa Gazette, June 9: A rich San Francisco Syndicate who are interested in the Mt. Raymond mines, are now engaged in building a wagon-road from Fish Camp to Mt. Raymond, a distance of four miles. They are preparing to run a 700-foot tunnel through the mountain at Mt. Raymond, from which ore will be taken and probably shipped below. There is a great amount going on and in contemplation, in this as yet undeveloped section of country.

#### Monterey.

**SLACKS CANYON COAL MINE.**—Salinas Index, June 3: Four six-horse teams are engaged in hauling coal from Slacks canyon to San Miguel. Three tunnels have been run in the mine, one of which is in 1150 feet, 900 feet of that distance being through a solid body of coal. There will, undoubtedly, be a branch railroad to the mine in the near future.

#### Napa.

**QUICKSILVER SHIPMENTS.**—Calistogan, June 8: During the month of May flasks of quicksilver from the mines here mentioned were shipped from Calistoga to San Francisco as follows: Bradford mine, 429; Napa Consolidated mine, 320; Sulphur Bank mine, 185; Great Western mine, 69; total flasks, 1003. The Bradford mine is producing finely, and its owners are making money rapidly. The Napa Con. mine is also producing well, and must afford a good profit above working expenses. Supt. Rocca, at the Gt. Western, continues to ship enough to pay working expenses. He will finally do better if the cinnabar can be found in the company's ground. He's a stayer.

#### Nevada.

**CEDAR.**—Tidings, June 8: Work on the Cedar mine at Nickerson's ranch, Wolf creek, will be resumed next week by the Grass Valley Mining and Development Co. When the winter rains caused suspension of operations the indications in the mine were very favorable.

**NEW MILL FOR THE PITTSBURG.**—Nevada Transcript, June 9: Mr. Elliott, under whose superintendency work is about to be resumed on an extensive scale at the Pittsburgh quartz mine in this district, is arranging for the erection on the claim of a first-class 20-stamp mill. The company having control of the property are said to be possessed of sufficient working capital to start it up in good shape. Heretofore the Pittsburgh has been conducted as a Grass Valley enterprise, the benefits from its working being derived principally by that town. Hereafter Nevada City will be likely to get the bulk of the business from it.

**POCKET MINING.**—Tuolumne Independent, June 2: It is reported that the Bonanza mine has suspended its flow of gold for the present, the vein having pinched out. As it costs the present lessees about \$1500 per month to run the mine, and as their lease expires July 1st, they probably do not care to put in a month's work with the possibility of giving some one else the benefit of their labor. If this is correct, it shows that these gentlemen are as sensible as they have been successful. Colby, Shaw, Jenkins & Co., working the Gold Nugget mine, have taken out several hundred dollars in prospects during the past 10 days, and hope soon to strike it rich. The Experimental mine is being run by the "boys" on shares. Messrs. Louis and John Engelke, John P. Conlin, Geo. Stayton and Henry Dunn, are the ones interested. Pocket mining seems to be attracting more men than the usual interest. The pocket miners are a hopeful set at best—a splendid exemplification of pluck, patience and perseverance.

**THE NORTH BANNER.**—Fletcher, Glasson & Co. of Grass Valley, have been continually prospecting on the north extension of the old Banner mine for years. They have performed a great deal of work, among which is a tunnel 1500 feet in length, numerous shorter ones, and shafts by the dozen, we should judge from a distant view. They have a five-stamp mill, run by water-power, which is kept constantly in operation. They are doing a great deal of dead and development work, and the mill pays for it all and declares a dividend besides. John Skewes is managing foreman. The mine is at present working 20 men. The tunnel gives about 400 feet backs, which affords the rock being crushed at present. The company are raising a shaft to the surface for the purpose of conducting water to the tunnel level, where hoisting machinery will be put in. This will enable them to sink about 300 feet deeper. The winze below the tunnel shows the ledge to be solid and gaining in width—it being over two feet now. The quality of the rock is A No. 1. It is heavily sulphureted and carries free gold in paying quantities. The North Banner is the coming mine. It is conveniently located for water-power, and is accessible from both Nevada City and Grass Valley. It is about 2½ miles from this city. The owners are going to be rewarded for their energy and pluck, and everyone is glad of it.

**GOOD QUARTZ.**—Grass Valley Union, June 9: On Tuesday a body of extra fine milling quartz was opened up on the 16th level of the Empire mine south of the main incline. The quartz, without being of the kind known as "specimen rock," showed

gold very freely, and about 1000 pounds of it was found rich enough to select. One piece of the quartz about three feet in length was estimated to contain as much as \$500. The ledge is two feet in thickness. This find is important in this, that it is rich rock in the bottom of the mine, as that is the lowest level on that side, the 17th level not being opened south, but north of the shaft. It is very encouraging, as it goes to prove what the last few years has unmistakably demonstrated, that the gold mines of the Grass Valley district improve in value and in size of the veins as depth is attained. The Empire, North Star and Idaho are living, and illustrious examples of this, and are as reliable to-day in their yield as at any time in their history. It is this finding of rich ore at great depths that must give encouragement for the rehabilitation and exploiting of old mines, which have lain idle for years, and will encourage the opening of others from the grass roots.

**THE MANZANITA MINE.**—Nevada City Herald, June 8: The owners of the Manzanita gravel mine are making some very important developments for themselves and for this district. They have drifted in and proven that they have a deposit some 600 feet in width, which will pay well for drifting. They are doing deadwork in the way of opening up the mine, so a large force of men can be employed. Orrin Gowell is probably one of the ablest and oldest gravel miners in the State. Si. Wheeler is also regarded as an expert in that kind of mining. The two men are confident they are on the track of a very rich and extensive deposit. They have thoroughly prospected as they have proceeded, and know just what they are about. It will not be long before more men will be employed in the Manzanita than in any quartz mine in this section. The prospects of this town will be greatly affected by their operations. The Nebraska, on the other side of the ridge, will also add much to the resources of the town when it commences.

**PROSPECTING FOR GRAVEL.**—Nevada City Herald, June 8: There is considerable activity on the Washington ridge in prospecting for drift mines. The Centennial and San Jose mines are pushing ahead developments and will determine the value of those claims this summer, it is hoped. Below there, near the Central house, Steele & Hanson are running to strike the channel this side of the Fillbuster claim, and are feeling greatly encouraged. Williams & Peterson, just above Cold Springs, near the Central house, have run in a tunnel 900 feet and are now raising up expecting to strike the channel almost any day. Chris. Ivey has a claim back of the Central house, toward Deer creek, on which he has done a great deal of work, but running out of funds, he has temporarily suspended and gone to work at Marsh's sawmill to replenish, when he will return and commence operations again. There is gravel, good gravel, and lots of it on that ridge, and it will be opened up some day, and perhaps this season.

#### Placer.

**DARDANELLES.**—Placer Herald, June 9: The old Dardanelles mine is paying well. The mill runs like a clock, and each clean-up shows an increase in the output of gold. The storm of Sunday broke the ditch and delayed crushing for a time, but the break has been repaired and the mill is pounding away.

**SINKING.**—The Gray Eagle shaft is down 285 feet. Operations have been delayed by the loss of a pump. According to the latest report, sinking was resumed Wednesday.

**MAYFLOWER.**—Mr. F. Chappellet, superintendent of the Mayflower mine, informs the Herald that he is not doing anything at the mine, simply looking after the machinery and other property until the new company takes possession. Mr. Chappellet says the owners of the Live Oak are well satisfied with the output of that mine. The gravel is very nearly five feet thick, and the channel 268 feet wide. He is running toward the rim on the eastern slope, and is but a short distance from the deepest and narrowest part of the channel. He will also make an upraise and tap a blue lead that is only a few feet above the tunnel.

#### Plumas.

**INDIAN VALLEY.**—Greenville Bulletin, June 9: The mill has been started up and is now running steadily. Mr. Prentiss is actively engaged superintending the mine. He has about 25 men in his employ.

**WOLF CREEK.**—The recent strike at that place is attracting much attention. The owners have drifted 90 feet on the vein, which shows up finely and prospects well. The owners are trying to make arrangements to fit up a mill and crush the ore.

**PACIFIC.**—This is owned and worked by Geo. Standart. In the present drift the vein is seven feet wide, and is increasing in size as progress is made. The stipes contain good ore which is crushed at the Kettle mill close by.

**DRURY.**—The road to the lower tunnel was completed several days since, and the hauling of ore from this place has begun. In the tunnel, a station is being opened up, and the full width of the vein, which is reported to be 16 feet, is being extracted. The ore is better than ever before had in the mine.

**GOOD YIELD.**—Justice Pierce sold to L. R. Anthony 17 tons of quartz which belonged to the late James Tennant, and which had been carried by him and piled up near his cabin. Anthony paid one dollar per ton for the ore, hauled it to the Indian Valley mill, had it crushed, and obtained 32 ounces of amalgam, which is probably worth \$225, or about \$13 per ton. Tennant had washed all the fine material from the quartz sold to Anthony. Evidently the ore was of excellent quality, and it is claimed that it came from the Indian Valley mine.

#### San Benito.

**QUICKSILVER.**—Hollister Free Lance, June 9: Flattering reports are received of the progress being made at the Gypsy mine. One thousand pounds of quicksilver were shipped from there this week, and the indications are considered decidedly favorable by mining men.

**COPPER.**—Mr. G. W. Towle has obtained two experienced miners who will proceed at once to complete the tunnel now being run in the Antelope copper mine.

#### Sierra.

**THE ALASKA MINE.**—North San Juan Times, June 8: From a gentleman recently in the vicinity,

we learn that the above mine and mill are in operation. Owing to attachment of the "lower wood-pile," delay was feared in the running of the mill, but this has been obviated by obtaining fuel from a neighboring woodman. The former employees of the Alaska Co. are working the mine, which is in the hands of Mr. Jackson, the recently appointed receiver. After paying expenses of a run, the employees are to receive their wages for that time; the surplus profits, if any, are then to be used in liquidating the workmen's claims for past services. It is to be hoped that the expectations of the Alaska's miners will be realized and that they may succeed in obtaining every cent due to them. When a body of men manifest willingness to do the square thing and pull off their coats and go to work, instead of becoming discouraged and loafing around waiting for somebody to start an industry and give them employment, it speaks loudly for their disposition and faith in the work undertaken.

**ST. LOUIS.**—Sierra Tribune, June 9: The Union Con. mine of Happy Hollow is in full blast. The tunnel is in 1250 feet and it is expected to reach gravel soon. The Excelsior mine has been closed down for some time on account of bad air and some little misunderstanding between Mr. Hendel and the contractors, which matter, however, has been settled by the latter being paid in full. The tunnel is now in about 500 feet, and in a few days work will be resumed with renewed energy. A contract is to be let to run ahead the tunnel at the Imperial mine. At the Young America mine \$18,500 was cleaned up as the result of last month's run.

#### Siskiyou.

**MINERAL RESOURCES.**—Yreka Union, June 9: Siskiyou county, the most northern of the California counties, has been but little explored for its mineral wealth, and less developed. Our county abounds in metalliferous deposits, second to none in the State, which are as yet intact and unexplored. Our secluded position did not encourage capitalists to embark in any mining enterprise that required large investment, skilled and expensive labor in comparatively inaccessible regions, the mines of the southern counties being nearer at home. This county is traversed from east to west by numerous streams, cutting deep gorges through the mountain chains and bisecting two prominent mineral belts, which by erosion and decomposition through time, have deposited their auriferous contents in the river beds and bars that traverse this county, rendering it the El Dorado of the early gold hunter. But immense areas of rich placers yet remain intact, with both labor, skill and capital to work them, either by extensive tunnels or the hydraulic process. Here on Siskiyou we can hydraulic without let or hindrance; there are no agricultural lands that can be injured, as the debris passes through deep canyons into the gorges or the Klamath river thence into the Pacific ocean. Our mineral belts course northerly and southerly through the county, and are of great width and well defined, containing deposits and veins in place of all the precious and baser metals and minerals that are utilized by man. Gold, silver, copper, lead, antimony, zinc and arsenic, with a sandstone for building material that is pronounced by experts in the employ of the Oregon & California R. R. superior to any on this coast. Iron and marble are also found. All of this mineral wealth that has lain so long dormant and unprofitable can and will be made available for the uses of man by the advent of the Oregon & California R. R.

#### Tuolumne.

**DONELLA.**—Union Democrat, June 9: Report has it that a company will soon take hold of the Donella mine at Arastaville. Mr. Lane informs us that he is getting along very well with the preparatory work on his mine at the Dickson ranch. He is erecting suitable houses, blacksmith-shops, etc. The main working shaft has been started, and is now well under way. The gentleman will put on a night and day shift next week.

**GRAVEL.**—The gravel mine of Thomas Skaggs and E. F. McTarnahan is developing well, and is no doubt a large and splendid claim. A tunnel runs under Table mountain a distance of 400 feet between two bodies of gravel, the blue and the gray. The blue body of gravel is evidently the old river channel and as drifts are run in under the mountain it appears to widen. It thus far ranges in thickness from 6 inches to 3½ feet. The tunnel has run along the shore of it for 75 feet and the face of the tunnel is in gravel nearly four feet in thickness. There is no telling as to the extent of this body of materials, since a tunnel 800 feet south of the present works reaches in and taps the same description of gravel, while north of this point for a considerable distance no tunnels have been run. Both the gray and blue gravel prospects well. Six dollars to a carload of 1000 pounds is no unusual thing, and from parties who were there last week it is learned that both bodies of material, prospect from a few colors up to a bit a pan. Taking it all together this is a superior property and a little capital would give it a position among the foremost mines of this State.

#### NEVADA.

##### Aurora District.

**DURAND.**—Esmeralda News, June 9: The ledge in the Durand mine has widened to six feet, and assays over \$100 clear across the face. This is said to be at a depth of 280 feet.

##### Washoe District.

**BELCHER.**—Virginia Enterprise, June 9: The 500 west crosscut advanced 25 feet during the week, making the total length 46 feet. The face is in soft porphyry. The 1300 raise advanced 12 feet in quartz assaying from \$10 to \$12 per ton. Have started to run north on the ore found in the raise near the south line on the 1300 level, and are now in six feet in fair-grade ore. Repairs to the shaft are progressing rapidly.

**BENTON.**—Have resumed work on the 725 level. ALPHA.—Have commenced to sink to the 500 level.

**POTOSI.**—The north drift on the 550 level is in 567 feet—still in quartz.

**CHALLENGE.**—The raise from the 1100 is up 126 feet, 16 feet having been added during the week.

**BULLION.**—Have started south from the bottom of the winze on the 640 level and advanced 25 feet.

**OCCIDENTAL.**—Have extracted 10 tons of ore. The Atlanta mill, capacity 25 tons, has been leased

by the company, and started crushing ore from the mine on Thursday last. Have shipped 60 tons to the mill.

**SCORPIO.**—The south drift on the 300 level is now advanced 315 feet, 40 feet having been added since last report.

**IOWA.**—The south drift from the east drift has been advanced 25 feet; total, 135 feet. The face is in good vein matter.

**HAYWOOD.**—Are prospecting in the winze below the tunnel level, and have lately struck much higher grade ore than above.

**SEC. BELCHER.**—The south drift from the 1300 raise advanced 15 feet during the week. No change to report in the ground.

**UTAH.**—372 level: The south drift has been extended 60 feet; total, 340. The formation is porphyry, clay and quartz, showing nominal value by assay.

**BALTIMORE.**—The water has been drained out of the mine, and are now cleaning the slum out of the drifts on the 380 level, preparatory to the resumption of work.

**ANDES.**—Are running south from the east crosscut on the 350 level in very good-looking quartz. Are sinking a winze on the 240 level 700 feet north of the shaft.

**MONTE CRISTO.**—Superintendent Strother has resumed work in this mine, and is now running to make a connection between the old and new shafts for purposes of ventilation.

**BEST AND BELCHER.**—El Dorado Level: The northwest drift from the main west drift has been extended 48 feet; total length, 205 feet. Formation quartz, showing value by assay.

**ALTA.**—The ore reserves on the 825 and 1150 levels are yielding their usual quota of ore, which is being reduced at the mill. All the machinery is running smoothly, and the mine is looking well.

**LADY WASHINGTON.**—Are raising from the 725 level, and are now up a distance of 335 feet in clay adjoining the veins. Are crosscutting from the raise at a height of 110 and 210 feet above the 725 level.

**WEST YELLOW JACKET.**—Timbering the northwest drift, and putting in a track. Are in about 30 feet on the ledge, or a little less. The superintendent expects to get a body of ore when this point is reached.

**ORST.**—Are working 15 men and hoist from 5 to 12 tons of ore daily, which is being reduced at the Briggs mill. Have fully \$65,000 worth of ore in sight. A horn assay made yesterday went up in the thousands.

**KEYES.**—Water coming in the winze on the 230 level, have stopped that work and commenced sinking the shaft with the intention of crosscutting to the ledge and upraising. There is no water in the shaft to hinder the work.

**YELLOW JACKET.**—Are shipping daily to the Santiago mill 90 tons of gold-bearing white rock. Are opening out the 800 and 900 levels, with the view of prospecting the country between the Yellow Jacket and Imperial shafts.

**CROWN POINT.**—The 600 level east crosscut advanced 35 feet during the week, through about the same character of ground as encountered in last report. Have started a southeast drift from the 700 station to connect under the 600 crosscut.

**ENCINEQUER.**—On the 122 level the northwest drift is out 99 feet; the face is in quartz. On the 222 level the east crosscut is out 167 feet. The face is in clay. On the 382 level the north drift is out 50 feet north of the north drift of the Alpha. The face is in clay and quartz.

**CONFIDENCE.**—The north drift on the 1000 level is in 40 feet, having been advanced 31 feet during the week. The joint Challenge-Confidence raise on the 1300 level is up 67 feet, 17 feet having been added during the week. Are shipping daily to the Brunswick mill 190 tons of ore, the battery assays of which average \$35.53 per ton.

**CHOLLAR.**—The south drift on the 650 level is in 170 feet. The face is in quartz. North drift No. 2 is in 133 feet. The face is in porphyry. The south-west drift is in 89 feet. The face is in clay and porphyry. The north drift on the 550 level is in 472 feet. The face is in low-grade quartz. The north drift on the 450 level is in 538 feet. The face is in quartz averaging \$20 per ton.

**HALE AND NOCKROSS.**—Since last report we hoisted 3216 tons of ore from the 600 and 700 levels, and have shipped 1976 tons to the Mexican mill, and 952 tons to the Nevada mill. The average battery assays have been \$34.36 per ton. All the stops throughout the mine are looking very well. We have bullion on hand and previously shipped for the month of May, amounting to \$168,685.97.

**GOULD AND CURRY.**—El Dorado Level: The southeast drift started from the end of the main southwest drift has been advanced 43 feet. The formation is quartz, giving low assays. Drain Tunnel Level: The northwest drift has been extended 27 feet; total length, 100 feet (stopped). During the week there has been extracted from the 250 and 300 levels, and shipped to the Douglass mill 253 tons and 1900 pounds of ore, the average battery assay of which is \$24.18.

**SAVAGE.**—On the 400 level we are stoping ore from the north and south drifts. On the 500 level the west drift was extended 49 feet and the south drift from the top of 600 level upraised 41 feet, and connection made between these drifts. This connection greatly improves the ventilation of the mine, and enables us to do important prospecting on this level. On the 800 level we are extending our south drift. The face is in a promising body of quartz, which gives some good assays. We are also extending the south drift on the 950 level. We are extracting about 80 tons of ore per day from between the 400 and 900 stations. Since last report have shipped to the Rock Point mill 1075 tons, battery samples averaging \$24 per ton. We have bullion on hand and previously shipped for May amounting to \$40,000.

#### Eureka District.

**ORE SHIPMENTS.**—Eureka Sentinel, June 9: The following number of tons of ore were shipped from the mines of the district to the furnaces during the week: Oriental & Belmont, 5½ tons; Whippoorwill, 26½ tons; Dunderberg, 35½ tons; Eureka Tunnel, 16½ tons; Prospect Mountain Tunnel, 8½

tons; White Pine, 4¼ tons; Featherstone, 3¼ tons; Rocky Point, 12 tons; Debris, 3½ tons; Pennsylvania, 1½ tons and Pat McTigh, 8¼ tons. From the Rives & Berry, 23 tons; Leonie, 11 tons; General Lee, 14 tons; Woodchopper, 26 tons and Marguerite, 2 tons.

**A GOOD PROSPECT.**—Joe Molino, the Laird Bros. and Giles Weller, who have a lease of the Wide West mine on Adams Hill, have run a tunnel 270 feet long and raised and drifted from it about 100 feet. This work has been going on for three months, and the openings are in excellent ground for ore, which, in fact, carries rich ore in various places in small seams and vugs. In one place a cave occurred where the ore shows in considerable quantity, but the ground has to be cribbed and timbered to hold it up, and more of the same kind of work will be needed before any amount of exploration can be carried on. The prospect for a paying yield of ore is very good.

#### Tuscarora District.

**BELLE ISLE.**—Tuscarora Times-Review, June 9: Drift north on the 250-foot level has been advanced 15 feet; total, 153 feet. Continues to look favorable.

**NORTH COMMONWEALTH.**—The shaft has been sunk to a depth of 67 feet, passing into the footwall of the vein at about 45 feet.

**NAVAJO QUEEN.**—Southwest drift on ledge from north crosscut, 200-foot level, advanced 15 feet. Face looking very favorable.

**DEL MONTE.**—The drift from the tunnel has been extended 33 feet; total length, 141 feet. No change in the size of the vein or grade of ore.

**NAVAJO.**—South drift, 350-foot level extended 29 feet. South drift from No. 4 crosscut has been advanced 13 feet. Winze, east vein, 250-foot level, has been sunk 45 feet. A drift has been started south at this point.

**GRAND PRIZE.**—On the 200-foot level the west drift has been advanced 12 feet; the ore in the face is not so wide as last reported, but is of fair grade. North crosscut from this drift is advanced 15 feet. Have cut through a vein of low grade ore.

**NORTH BELLE ISLE.**—Fair progress has been made with all the work in and about the mine. The usual output of ore has been made from the different levels. Winze from the 300-foot level has been sunk 24 feet, developing two feet of very high-grade ore.

**FOUND TREASURE.**—Northwest drift has been extended 15 feet, total, 45 feet. The face of the drift is showing small seams of staphanite and ruby ore. Crosscut No. 2 has been extended 10 feet, and has crossed a vein of low-grade, disintegrated quartz averaging from 18 inches to 2 feet in thickness, and carrying kidney-shaped bunches of high-grade ore in places.

**NEVADA QUEEN.**—Work of putting in timbers on the 350-foot level is progressing favorably, and has exposed very fine ore both north and south. The chute in the upraise is being put in and straightened so as to make a clear opening from the 200 to the 300-foot level. Considerable ore has been extracted during the week in doing the above work. Car samples average \$251 per ton.

**COMMONWEALTH.**—On the 100-foot level, east crosscut drift south has been extended 24 feet, passing into the same formation as that carrying the ore on the 150-foot level south drift. The drift, from upraise north of shaft, 150-foot level, being run to connect with raise from east crosscut, has connected the two, thus giving good air in east crosscut, 150-foot level. Ore extracted from this drift gives an average assay of \$551 per ton. The east crosscut from north drift, 150-foot level, has been advanced 18 feet, and cut into low-grade ore, assays ranging from \$40 to \$113 per ton. Upraise from 150-foot level to connect with north intermediate drift has been connected, chute has been put up, and work of pushing the intermediate drift north will be started, there being good ore in the face; 150-foot level south drift has been extended 19 feet. The drift has been all in good ore, and looking well in the face. There is no hanging or footwall in sight, and cannot tell how much of an ore body there is. Have followed this ore 190 feet since first showing in the drift. Car samples of all second-class ore hoisted for the week, average \$464 per ton; average of concentrating ore, \$51.

#### ARIZONA.

**EUREKA DISTRICT.**—Prescott Courier, June 9: Colonels Wilson and Smith and Messrs. Rybon and Waters own fine ledges in Eureka district that are certain to become fine mines. From several careful assays and samples, they are satisfied that the ore from these ledges will yield from 45 to 47 per cent lead and from 15 to 104 ounces silver per ton. Very little work has, as yet, been done upon these ledges, so that the results are from top rock. Col. Wilson, who has experience in mines in many States and Territories, also in Mexico, has gone down to superintend development work, sorting and shipping ores. The ledges are near the Hillside mine and the Lawler copper mines.

**BRADSHAW.**—Veins in the four tunnels of the Oro Bonita and Oro Bella mines, Bradshaw district, are from 20 inches to 3 feet wide, and average samples are \$54.30, \$73.80 and \$106.75 gold.

**GROOM CREEK.**—Standard mill, Groom creek, six miles south of Prescott, is working ore from the Adel mine. We had the yield, lost it, but remember that it was good. The ore can be assorted so as to mill over 200 ounces of silver.

**TURKEY CREEK.**—A gentleman who is working a claim on the Goodwin mine, Turkey Creek district, says he recently shipped ore that yielded 4600 ounces of silver to the ton. George Zika has arrived from Lower Turkey creek, 30 miles southeast of Prescott. He has there a mine called the Golden Belt. It is a "blanket" ledge and a good one, too. Thirty-eight tons, worked in an astras, by water-power, yielded a trifle less than 50 ounces of gold, also some silver. George has another mine, the Mesa, and an astras on Lower Agua Fria. He recently worked 21 tons of Mesa ore, got 26 ounces gold, 821 fine, worth \$437.56; also \$4.99 in silver. Being a good, steady worker and first-rate man in every respect, the Courier is glad to learn of his success.

**WALKER DISTRICT.**—Owners of the Amulet mine, Walker district, are making regular shipments to the sampling works. Returns of 20 tons of ore shipped to Argo, Colorado, by Dan Hatz, from the

Ruby and Helena Vista mines, Hassayampa district, are \$1387.77, \$10 per ton off for treatment. He is satisfied with the yield, has abundance of such ore and will make regular shipments.

**ORE SHIPMENTS.**—Mohave Miner, June 9: The Oliver Bros. have a shipment of ore from the Sunlight mine on the depot platform. The mill at Cerbat will be started next week. The first run will be made on a lot of low-grade ore. The sampling works have been busy all week, and ore is coming in in such quantities as to keep the works running to their full capacity. The American Flag boys have another carload of rich ore on the way to the sampling works. The American Flag is looking better than ever. T. L. Ayres has made a rich strike in Union Basin. The ledge is reported to be three feet wide and assays from 120 to 252 ounces per ton in silver and from five to ten ounces in gold. There is a probability that the McCracken mine will resume operations before many months. This is the best property in the Territory, and there is now no reason why work should not be resumed. Thos. Eager, superintendent of the Kingman Silver Mining Co., is in town this week. The company has suspended operations temporarily, and arrangements are being made to put on a larger force of men, and a tunnel will be run to the body of ore recently uncovered. The mine will be energetically worked.

#### COLORADO.

**RICH STRIKE AT LEADVILLE.**—Denver Republican, June 8: The Leadville mining district is holding out very satisfactorily, and the daily production is placed at over 1000 tons of smelting ore. While a great many mines contribute to this output, the bulk is probably secured from four or five leading mines. The Maid of Erin and Minnie and A. Y. mines produce about 200 tons a day each. Next come the Adams, the Wolfstone, the Colonel Sellers, the New Year and the Louisville, with yields of 60 to 125 tons a day. A considerable portion of the production of the camp at present is very fair lead ore, and indications point to a greater lead yield during 1888 than was made in the past year. It would prove a difficult matter to make even an approximate estimate of the average value of the Leadville ores. While much of the mineral is of very low grade in silver, there is also a considerable production of high-grade ore, and it is not as easy a matter to strike a general average as it was several years ago. The Leadville district during the week past was favored with a new strike, made in the Pocahontas mine, situated on the northwest skirts of Carbonate hill. The newly opened ore body was encountered at a depth of about 400 feet, and shows a thickness of four feet, the mineral running about 150 ounces in silver to the ton and carrying 50 to 60 per cent in lead. This discovery is one of the most important made in the Leadville district for a long period. The shaft is situated below the Carbonate and Penderly faults, the line beyond which nothing had so far been discovered. It opens up a comparatively new area, of vast extent, and is almost certain to lead to other work that will be followed at no distant day by the exploration of the ore horizon under the city of Leadville. The Pocahontas is situated right in the limits of the city, less than ten blocks from the courthouse, and the ore shoot encountered, if maintaining the conventional course, will lead right under the heart of the city. The dip of the vein is to the westward or under the town, but this inclination will probably be changed if the vein is followed for some distance, as was shown in the Star of the West, between the Carbonate and Iron hill faults. The discovery is one of great value to the Wolcott Mining Co., the Orion and other lodes in the vicinity, and to the placer properties on which the eastern half of the city is located.

#### IDAHO.

**THE CINNABAR MINE.**—Challis Messenger, June 5: The Cinnabar mine has been bonded by Messrs. Geo. and Cal. Kirk, the locators and owners, to St. Louis and Illinois capitalists for a large amount of money, and a bonus of \$20,000 has been put up and is on deposit in St. Louis; working capital, \$50,000. The bond is for 90 days. Mr. Cal. Kirk has been selected as general manager by the company, and is to take charge of the property as well as see to the putting in of a large amount of fine machinery. A wagon road is to be built from the mine, down Squaw creek, crossing the Salmon river at the mouth of Squaw creek and connecting with the Slate creek road, about 4½ miles above Clayton. As soon as the road is completed, an air compressor and Burleigh drill will be put in. The compressor will be used for the double purpose of driving the Burleigh and hoisting from the main shaft. The Burleigh is to be used for running a 500-foot tunnel. This tunnel, especially for drainage, is almost an absolute necessity, as the mine heretofore has been very wet. It is also the intention of the company to put in concentrating works. These works are to be built on Squaw creek, near the mine, and are to be completed this season. The company expects to use steam as the motive power. The Cinnabar is situated on Bruno creek, a tributary of Squaw creek, and is about ten miles in a northwesterly direction from Clayton. It is owned, as above stated, by Geo. and Cal. Kirk, the locators. It is developed by a shaft—on the dip of the vein, which is not far from 80 degrees—304 feet deep. This shaft is sunk on the footwall, and from the bottom a crosscut has been driven through the ore 18 feet, not striking the hanging-wall. This 18-foot breast of ore, as developed by the crosscut, samples 43 ounces in silver and 30 per cent lead. No stoping has been done to speak of, and all the ore extracted has been taken out in sinking the 304-foot shaft. Five thousand tons of second-class ore are now on the dump, and owners have realized from the first-class ore, which they shipped to Clayton and Bayshore for reduction, the handsome sum of \$58,000. The Cinnabar is a great concentrating proposition. The ores are silver-lead and carry no sulphurates or chlorides.

**A GOOD OPENING FOR WORKERS.**—Wood River Times, June 1: There is no good reason why any able-bodied miner wanting to work should be idle at this season on Wood River. If he cannot obtain employment as good he can do almost as well, with the chances of doing much better, by leasing a prospect. There are dozens such which have ore in sight, but not enough to pay expenses if worked by days' work, which would prove bonanzas to industrious and competent miners. Let them take leases.

To be sure, the returns are not as reliable as if one were working for wages, but a leaser is liable to make a fortune in a short time. We have no doubt that, if the facts were known, it would be demonstrated that leasers have so far realized more profits from our mines than the owners have. Wood River offers more and better opportunities for poor men to-day than it ever did.

#### MONTANA.

**THE CAPITAL MINE.**—Butte Miner, June 8: The Capital mining property situated six miles west of Helena is creating a great deal of talk at present in mining circles. The facts about the mine, as near as can be ascertained, are that the lead has been opened to view about 50 feet from the surface, showing a ledge about six feet wide. The hanging-wall is well defined, and a seam of 2½ feet of the ledge adjoining said wall has averaged \$1500 per ton. The remainder of the lead is composed of boulders which have thus far averaged between \$50 and \$80 per ton. The ledge is well defined for a distance of 2000 feet, and assays of the croppings have shown \$12 per ton. Mr. H. E. Owen, who has just returned from there, says that the opinion in Helena is that the property is an exceedingly good one. He was accompanied to the mine by Geo. H. Babcock, one of the most prominent mining men of the Territory, who pronounced it the best gold property he had ever seen, considering the amount of development upon it. From all that can be learned by our reporter the universal opinion as expressed by prominent experts is that the Capital mine will be one of the principal mines in the Territory.

**ELKHORN DISTRICT.**—Montana Mining Review, June 9: The Dunstone mine is now opened by a shaft 65 feet deep, and shows a remarkably fine body of ore. Fully four feet of solid galena is now exposed, and its quality is improved since the last reported assays. About 100 tons of ore are already on hand, and not less than 300 tons are in sight, as ordinarily estimated. Should the ore prove to be no better than that formerly tested it will sell for about \$100 per ton at the dump.

**THE RELIEF.**—Considerable water is coming into the 200-foot level of this mine. It is reported that ore has been reached, and an extra boiler and a pump have been ordered for the purpose of keeping the water under control.

**THE UNION.**—A 400-foot tunnel has been driven into this lode along the footwall and for nearly the entire distance within sight of good ore. A shaft 80 feet deep connects with the tunnel at a point 154 feet from its mouth. Continuing 57 feet below the tunnel, good ore was encountered, and a level from this depth was run along the vein about 90 feet with good prospects all the way, but the flow of water was in excess of the hoisting capacity of the windlass and bucket and work in that part of the mine has been abandoned for the present. An excellent pay streak of about two feet thickness is now in the breast of the tunnel.

**THE JAMES R. KEENE** is developed by a shaft 400 feet deep and is equipped with a steam hoist. The adjoining mine, the Elkhorn Mining Co.'s Hotter lode, is pumped to such a depth as to drain the Keene most effectually. A tunnel in 250 feet shows a pay streak, somewhat irregular, but carrying rich ore, which improves in its character and quality as progress is made into the hill. Several carloads of this high grade output is now on the dump, assays of which average about \$250 per ton. Considerable activity is now manifested among the miners of Elkhorn.

#### OREGON.

**SALE OF MINING PROPERTY.**—Bendrock Democrat, June 9: An interest in the Herculean mine on Cracker creek has been sold to Eastern capitalists, for we learn a handsome consideration. Development work will be continued under the new management with diligence. The Herculean as the property of D. C. Probasco and Fred Huntington has produced some very rich ore and is recognized as one of the best mines on Cracker creek.

**FROM CORNUCOPIA.**—Messrs. H. Webb and E. P. Torrey have returned from the Pine creek mines, where they spent the past couple of weeks making experiments on ore from the Companion mine, working the same in the Hope mill. These experiments have proven quite satisfactory, so we are informed.

#### UTAH.

**REVIEW.**—Salt Lake Tribune, June 8: The current week closed the first five months of the year. The receipts for these five months have been reported as follows: January, \$327,141.43; February, \$285,687.79; March, \$283,263.98; April, \$224,019.60; May, \$385,725.14; total, \$1,505,847.94. This of course is not the total production; it excludes all ores shipped, and does not include such producers as make annual reports only. The week has been a quiet one, with a good deal of discouragement on account of the low price of silver and lead. A few mines have shut down, others are storing their ore in place of selling it, and all mine managers are much irritated at the Treasury rulings that admit Mexican lead ores free of duty, this influx being considered chiefly responsible for the present bad condition of the lead market. The receipts in this city for the week ending June 6, inclusive, were to the value of \$86,199.05, of which \$46,668.33 was ore and \$39,530.72 was bullion. For the previous week the receipts were \$61,949.56 in bullion and \$59,440.07 in ore. The Ontario product for the month of May was, of bullion, 98,366.71 fine ounces; ore sales, \$68,337.36; total, \$166,704.07. For the week it was from ore sales, \$10,820.73. The daily output for May was 72,659.37 fine ounces of bullion, \$14,318.85 from ore sales, an approximate total of \$86,977.72. For the week it was \$7740.22 from ore sales. The daily paid on the 31st its regular bi-monthly dividend of 50 cents per share, or \$75,000, being dividends Nos. 14 and 15. Fine bars, valued at \$11,354.54 were received during the week. The product of the Hanauer smelter for the week was \$19,105 in bullion; of the Germania, \$9074.18 in bullion. Ore receipts in this city for the week were \$16,420 by Wells, Fargo & Co.; \$23,750 by McCormick & Co.; and \$6498.33 by T. R. Jones & Co. The Horn Silver still makes no showing, though it is understood in a general way that it is not altogether idle.

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

### FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco  
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

### "HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

H. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS**, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et al.

We also manufacture the **Single-Jointed Giants**.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.

## HOSKIN'S

IMPROVED

ONE-JOINTED

HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that any style of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleeing miners for royalty, is ABSOLUTELY void, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. R. HOSKIN, Empire Foundry, Marysville, Cal.

## ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?

Are you going to make any change in machinery? Are you freighting by team or packing on mules? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of

## THE DODGE PATENT INDEPENDENCE WOOD SEPARABLE OR SPLIT PULLEYS.

They are the Lightest, Strongest, Best Balanced and Most Convenient Pulleys Made in the World.

Entirely new and original. Adapted to any power required. Time, trouble and money saved by using these pulleys. Also Agent for the DODGE SYSTEM OF ROPE TRANSMISSION. Estimates furnished.

Price List and Catalogues mailed free.

JOHN SIMONDS, Pacific Coast Agent, 509-513 Mission St., S. F.

## THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required. In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,

Room 709.**HEALD'S****BUSINESS COLLEGE,**  
24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

SEND FOR CIRCULAR. E. P. HEALD, President.  
C. S. HALEY, Secretary.

GO TO THE OLDEST AND THE BEST

**PACIFIC Business College,**  
320 POST ST. SAN FRANCISCO.  
1868. 1888.

LIFE SCHOLARSHIPS, \$75.  
NO VACATIONS. DAY AND EVENING SESSIONS.  
Ladies admitted into all Departments.  
Address: T. A. ROBINSON, M. A., President.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey &amp; Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey &amp; Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JUNE 5, 1888.

- 384,119.—BOILER-FEEDER—A. Blatchley, S. F.  
 384,124.—ELEVATED CABLE AND CAR PROPELLER—H. Casebolt, S. F.  
 384,136.—GATE—John Donnelly, San Mateo, Cal.  
 384,050.—HYDRAULIC PUMP—J. H. Martin, Oroville, Cal.  
 384,171.—EASEL—E. R. Morris, S. F.  
 383,976.—ROTARY VALVE—Jas. O'Donnell, S. F.  
 383,977.—GRINDSTONE HANGER—D. O'Leary, San Bernardino, Cal.  
 383,993.—NECKTIE FASTENER—W. R. Sargent, S. F.  
 383,995.—ROTARY PUMP—O. Seifert, S. F.  
 384,089.—CARTRIDGE-LOADING MACHINE—Prentiss Selby, Oakland, Cal.  
 383,997.—SIDE-HILL PLOW—A. K. Snodgrass, Ellensburg, Ogn.  
 384,179.—CLOTHES DRIER—E. S. Sutton, Snohomish, W. T.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GATE.—John Donnelly, San Mateo, No. 384,136. Dated June 5, 1888. This invention relates to certain improvements in gates and wheels or pulleys, by which a sliding reciprocating gate is carried and an elongated chamber or journal-box with guides, within which the pulley shaft, travel or roller, so as to reduce the friction to a minimum, end a means for easily removing the pulley from its box.

ELEVATED CABLE AND CAR PROPELLER.—Henry Casebolt, S. F. No. 384,124. Dated June 5, 1888. This invention relates to improvements in cable-railway propulsion, and as a means for operating the cars, which are running upon a track upon the ground by means of an aerial cable. It consists of a cable supported above the surface of the ground, a mechanism connected with the car, and carrying the grip on tongs, means for picking up the cable and placing it in the grip, means for throwing the cable entirely off, and means for adjusting the position of the grip with relation to the cable together with certain details of construction.

CARTRIDGE-LOADING MACHINE.—Prentiss Selby, Oakland. No. 384,089. Dated June 5, 1888. The feature of this invention is an improved device for crimping the shells after the powder, shot and wade are in place. It consists of a vertically moving stem or spindle, with means for rotating the same, and an arrangement of springs and weighted arms whereby the operation is more perfectly performed. By the construction employed it is possible to bring the crimping down upon the edge of the shell with a gentle and gradually increasing pressure instead of with an abrupt blow. This device is used in connection with the Chamberlin cartridge machine at the Selby Lead Works, where standard cartridges are made in large quantities.

BOILER FEEDER.—Amrose Blatchley, S. F., No. 384,119. Dated June 5, 1888. This invention consists of a hollow wedge-shaped chamber, the smaller end of which is fixed to a hollow pipe or shaft which extends outward through a stuffing-box in the side of the boiler, and water can flow from the boiler through the pipe into the wedge-shaped chamber, when the boiler contains enough for its needs. This increases the weight of the chamber and depresses it so that it acts upon a valve and closes the boiler supply-pipe. When the water falls in the boiler it runs out of the chamber, and by thus lightening it allows it to rise and open the supply passage. The boiler supply is thus automatically controlled.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

SALT LAKE AND LOS ANGELES R. R. Co., June 13. Object, to construct a railroad in Kern, Tulare, Inyo, Mono and Los Angeles counties, Cal., and through Nevada to Salt Lake. Capital stock, \$20,000,000. Directors, Isaac Trumbo, Alex. Badlam, Wm. H. Brown, George Burgess and John W. Creagh.

CALIFORNIA KINDERGARTEN TRAINING SCHOOL, June 1. Object, training and instructing persons wishing to become kindergarten teachers, and the furnishing of assistants to the free kindergartens. The directors are: Kate D. Wiggin, Nora A. Smith, Horace C. Davis, Ira G. Hoitt, Horatio Stebbins, John Swett, William E. Brown, Sarah B. Cooper and Mary W. Kinosaid.

## Mining Share Market.

Mining stocks have been somewhat livelier this week than has been usual of late.

The most important news to announce in the mining situation is the work which has been started on the 800 and 900 levels of Yellow Jacket, with a view to exploring the Imperial, Challenge, Confidence and the northern part of the Yellow Jacket on the 600, 700, 800 and 900 levels. This is the largest section of virgin country on the Comstock lode within the confines of its determined mineral belt. The outlook, therefore, in that portion of the Comstock is very favorable for the finding of bodies of ore of considerable extent. It is proposed to prosecute this work with vigor.

Tuesday's Virginia Chronicle contains the following: When the shrinkage in the river compels the hanging up of a majority of the Eureka mill stamps the California will start 60 of its complement of 80, dropping on Con. Cal. and Virginia ore. The Brunswick mill, where Confidence ore is crushed, is equipped with steam as well as water-power, and with the former as an auxiliary the full complement of its stamps can be kept hammering away steadily the entire year. The 20 additional stamps now being added to the complement of the Chollar mill will be ready to drop early in July, and will supply the place of those hung up in the Mexican, now crushing Hale and Norcross ore. There need, therefore, be no suspension of dividends during the entire year through lack of ore-crushing power in the above trio of mines. The Savage, Yellow Jacket and Overman will be the only mines the bullion product of which will be seriously curtailed this year, through a hanging up of stamps from a shrinkage of the Carson river flow during the dry season. This will result in a curtailment of less than \$60,000 in the monthly bullion yield of the Comstock.

PRACTICAL HINTS FOR DRAUGHTSMEN.—This is the title of a new work by Chas. W. MacCord, professor of mechanical drawing in the Stevens Institute of Technology, published by John Wiley & Sons, New York. The leading object of the treatise is to explain the various modes of representation which are in many cases better than the precise ones of projection; for mechanical drawings often convey false impressions by too close adherence to the truth, and become obscure by being too exact. The subjects treated are: Working drawings defined; rules of projection defined; clearness and certainty the essential requisites; illustrative examples on the representation of bolts, nuts, screws and such; free hand sketching; sketching in proportion; its utility in designing; sketching from measurement; methods of practicing; practical suggestions and examples; drawing instruments and materials; proportion of bolts, nuts, threads, etc., according to the Sellers & Whitworth system. The work is a very valuable one to draughtsmen. The illustrations are good and clear, and the text simple. The retail price of this book is \$2.50.

## San Francisco Metal Market.

## New York Metal Market.

Telegraphic advices dated June 14th give the following New York prices:

BAR SILVER—92c per oz.  
 BORAX—9c.  
 COPPER—LANK—\$16.60.  
 IRON—No. 1, \$22.00.  
 LEAD—\$3.67 1/2 @ —  
 TIN—\$17.90 @ —

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Dull, closing at \$16.60 @ 16.70. Transferable Notices (Lake) issued at \$15.50 @ —.

LEAD—Quiet, at \$3.50 spot. Transferable Notices issued at \$4.10.

TIN—Nominal at \$18.25 @ —.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, @ —. Baltimore Copper, \$14.50 @ 15.40. Orford Copper, \$15.50 @ 16.00. P. S. C. Copper, @ —. Foreign Lead, \$4.25 @ 4.50. Foreign Spelter, \$5.50 @ 5.75. Antimony, \$10.50 @ 14.00.

R. KONDO, a wealthy Japanese mine-owner, has been visiting Nevada county, with State Mineralogist Irelan, looking at the mines and mining machinery. He will go to New Mexico, Arizona, Colorado, Idaho and Montana, before returning home. His idea is to examine new mining appliances.

## MINING SHAREHOLDERS' DIRECTORY.

## News in Brief.

THE White Star cannery at Astoria was destroyed by fire on Tuesday last.

OVER two-thirds of the saloons in Philadelphia are closed by the Brooke law.

THE spring rodeo having ended, cowboy tournaments are taking place in Arizona.

THE murderers of John Lowell, the wealthy Sacramento farmer, have been captured.

THE records of the Patent Office show that women have obtained patents on 1900 inventions.

A FIRE entailing a loss of \$90,000 occurred in a business block on Broadway, Oakland, on Monday evening.

WOMEN are the State Librarians of Indiana, Iowa, Kentucky, Michigan, Louisiana, Mississippi and Tennessee.

THE price of diamonds has fallen. It was over 22 shillings per carat in October, 1887, and it is now less than 18 shillings.

THE payroll of the Comstock mines for May aggregate \$238,575, of which amount, the Enterprise says, \$30,000 was paid in silver.

THE Santa Paula Chronicle reports the shipment of 184 tank-cars of oil from that place during the month of May, the largest shipment ever made in one month.

A LETTER has been received by the Immigration Bureau at Maryville that a wagon train is being made up in Hickory county, Mo., consisting of 18 families, to cross the plains to Yula county.

A CANAL has been projected along the foothills from a point near Firebaugh's, Fresno county, to Tracy, San Joaquin county, taking water out of the San Joaquin river at the first named place.

NEWS has been received by J. D. Redding, Deputy U. S. Fish Commissioner on this coast, that a carload of selected lobsters for breeding purposes will leave the East for this city some time during the present month.

TWELVE artesian wells are to be holed to furnish water for the Watsonville beet-sugar factory, which will use 2,000,000 gallons daily.

While boring one of these wells a day or two ago a piece of a redwood tree was encountered at a depth of 140 feet.

CLAUS SPRECKLES reiterates the statement that his sugar refinery at Philadelphia will be going within a year, with a daily capacity of 1000 tons, which will be a much larger capacity than any other refinery in the country. The work will be rapidly pushed.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3.00 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already an subscriber, please show the paper to others.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hale and Norcross (total for May), \$168,685; June 14, \$32,000; Cons. California and Virginia, 9, \$221,874; Savage, 9, \$49,000; Eureka Con. (for May), \$60,000; June 13, \$420,600; Hanauer, 5, \$4400; Germania, 7, \$2127; Hanauer, 7, \$4345; Germania, 8, \$1796.

"PRACTICAL TRAINING."—This is the title of a little work of some 45 pages by Robert Grimshaw. The subject matter was originally delivered as an address to engineers and machinists apprentices, and is now put into convenient form. The writer is the author of Grimshaw's practical catchism on the pump, steam engine, etc.

Machine Drill Steel.

The Sanderson Bros. Steel Co. is now manufacturing a form of drill steel heavier than that formerly made. The little cut given herewith shows the form of this patent machine drill steel. A similar form has been in use on the Comstock and elsewhere for some years, but of two light section for general use. It is a swayed very well for short drills, but for long

Once the vibration was so great as to necessitate its being welded to octagonal bars, using this for the bit or working end. The improved form as here shown, is stronger and has less vibration in use than the octagonal bars.

This steel is made in three sizes, 1 1/2, 1 1/4 and 1 1/8 inch, corresponding with 1 1/2, 1 1/4 and 1 1/8 inch octagon. It costs no more than the octagon bars of same quality of steel, and by its use all the labor and cost, practically, of forging the drills is saved, which is a large item when octagon bars are used, as it has to be forged to this shape by hand. A stock of this steel is carried in San Francisco by the agent H. D. Morris, 220 Fremont St.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

A TEA EXPERIMENT IN NEVADA.—It is stated that a prominent land-owner of Elko, Nev., is seeding his ranch to tea. Indian women and children will be employed in gathering the leaves.

DELINQUENT NOTICE.

Butte Creek Hydraulic Mining Company.

Location of principal place of business, 213 Market St., San Francisco, Cal. Location of works, Butte county, California.

NOTICE—There are delinquent, upon the following described stock, on account of Assessment No. 12, levied on the 27th day of March, 1888, the several amounts set opposite the names of the respective Shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.

And in accordance with law, and an order of the Board of Directors, made on the 27th day of March, 1888, so many shares of each parcel of such stock as may be necessary, will be sold at public auction at the office of the company, 213 Market street, San Francisco, Cal, on Monday, the 28th day of May, 1888, at the hour of 1 o'clock p. m., of said day, to pay Delinquent Assessments thereon, together with costs of advertising and expenses of the sale.

LOUIS R. LEVY, Secretary.  
Office—213 Market St., San Francisco, Cal.

POSTPONEMENT.

The above sale day is hereby postponed to MONDAY, June 11, 1888, at the same hour and place. By order of the Board of Directors. LOUIS R. LEVY, Secy.

MEETING NOTICE.

Office of the Alabama Mining Company,

Corner of Fifth and Stevenson streets, San Francisco, California, May 12, 1888. Location of works, near Newcastle, Placer county, California.

NOTICE is hereby given to all the Stockholders of said Alabama Mining Company (a corporation) that there will be a general meeting of the Stockholders of said company held at the office of said company at the S. W. corner of Fifth and Stevenson streets, in the city of San Francisco, Cal., on Monday, the 11th day of June, A. D. 1888, at the hour of 1 o'clock p. m., of said day, for the purpose of removing from office the following named Directors of said company, to wit: Owen King, William Reinhold, Samuel Jones and Michael Hoffman, and for the further purpose of filling by election then and there the vacancies that may be caused in the Board of Directors by such removals.

The undersigned is the owner of more than two-thirds of the capital stock of said corporation, as well as a Director and President of said Company, and makes this call under the provisions of Section 310 of the Civil Code.

J. J. SMITH,  
President of the Alabama Mining Company.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) on the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. PRICE, \$3, coin, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written, for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, containing six months' numbers in each, indexed, can be had at this office at \$4 per volume.

Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & Co., Publishers, 252 Market St., San Francisco.

"De man wot knows it all is alluz a-makin change, a-buyn' ob experience." The man who does not think that he "knows it all" about Pumps can find out a great deal about them in *Grimshaw's PUMP CATECHISM*. By mail, postpaid, \$1. Dewey & Co., 220 Market St., S. F., Cal.

MINING MEN

And the Public Generally!

AN UNPARALLELED OPPORTUNITY FOR INVESTMENT.

S. P. DORSEY, representing over three-fourths of the capital stock of the Maryland Gold Quartz Mining Company, of Orass Valley, which is divided into 500,000 shares, par value, \$20 per share, desires to dispose of a sufficient number of shares to develop this property, the value of which has been thoroughly demonstrated by the continued prosperity of the ledge, from its commencement in the Eureka, through the Idaho to the Maryland line; the productive record of said mines being about \$15,000,000. The wealth of this wonderful and world-renowned ledge is shown by the latest workings in the Idaho to be as fully developed close to the Maryland line as in the richest part of its past course.

Any one investing in this property, can be assured of a continued success equal to its predecessors, viz.: Yielding 25 per cent in dividends per year upon the price at which the stock is offered for sale—viz., \$2 per share. For further particulars inquire of

S. P. DORSEY, At the Express Office, Graese Valley, Nevada County, Cal.

Patent Agency:

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

## THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

**SQUARE FLAX PACKING,**

Manufactured from strictly first-class Flax and pure lubricants. Superior to all others for Water and Steam. Packs with less friction and makes a tighter joint than any other packing made. Imitations of inferior quality having been put upon the market, we have been compelled to adopt the above trade-mark, and all of our packing will now have a RED CORD running through the center of its entire length. See that you get it and take no other. Sold by all hardware dealers. Price, 50 cents per pound. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market St., San Francisco, Cal.

MILL SUPPLIES AND LUBRICATING OILS.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

## Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

## The Lick Observatory.

### The Largest Telescope in the World.

#### A Description of the Observatory and the Appliances.

In the deed of trust of the late James Lick,

deed were: Thos. H. Solby, D. O. Mills, Henry M. Newhall, Geo. R. Howard, James Otis, John O. Earl and Wm. Alvord. At that time it was intended to build the observatory on the borders of Lake Tahoe, Placer county, California.

During the summer of 1884, Mr. D. O. Mills

firm. A general plan of the Observatory and an outline of its proper work were submitted to Mr. Mills by Prof. Holden in October, 1874. It was also suggested that no site should be selected and finally accepted by the trustees until it had been astronomically examined by a competent observer. It was proposed that

D. Alhaston, John H. Liok, John Nightengale and Bernard D. Murphy. This Board of Trustees was succeeded by a third board (the present one) under appointments made by James Lick, Sept. 2, 1876, ratified by action of the trustees in session Nov. 29, 1876, and confirmed by action of the courts during the settlement

THE STAR SPECTROSCOPE AND EYE END OF THE TELESCOPE AT THE LICK OBSERVATORY.

dated July 16, 1874, he provided the magnificent sum of \$700,000 for the purpose of constructing a powerful telescope "superior to and more powerful than any telescope ever yet made, with all the machinery appertaining thereto and appropriately connected therewith, or that is necessary and convenient to the most powerful telescope now in use, or suited to one more powerful than any yet constructed, and also a suitable observatory connected therewith." The trustees under this

visited Washington and New York and had frequent consultations with astronomers and others, especially with Professors Newcomb and Holden in Washington, and with Dr. Henry Draper in New York. It was decided that Prof. Newcomb should go to Europe to investigate the matter of procuring the glass necessary for a large reflector or a large refractor. Accordingly he went, in pursuance of a request dated Dec. 3, 1874, and on his return submitted a report detailing his negotiations with several

Mr. Burnham should be asked to visit the various sites in question, and to observe double stars at each of them with the six inch telescope he was regularly using in Chicago. This appeared to be specially important since the topography of the region about Lake Tahoe did not seem favorable to those conditions of steady atmosphere so essential in astronomical work.

Mr. Lick's second deed of trust was dated Sept. 21, 1875, and appointed the following Board of Trustees: Richard S. Floyd, Faxon

of compromises with the heirs of Mr. Lick after his decease. The present Board is composed as follows: Richard S. Floyd, President; Wm. Sherman, Vice-President (died Sept. 12, 1884); Edwin B. Mastick, Treasurer; Charles M. Plum, George Schoenwald.

A further consideration of the proposed site of the observatory at Lake Tahoe led to the conclusion that whatever might be the advantages of the situation, the disadvantages arising from the extremely severe winters would proh-

ably outweigh them. Mr. Lick himself was convinced of this, and had various consultations with Capt. Floyd on this subject. Capt. Floyd advised the examination of some mountain further south. During the summer of 1875 Mr. Lick sent Mr. Fraser, his agent, to report, to Mt. St. Helena, Mount Diablo, Loma Prieta and Mount Hamilton, with special reference to their accessibility and to the convenience of establishing extensive buildings on their summits.

Mr. Fraser's visit to Mt. Hamilton was made in August, 1875. In many respects this seemed to be the best situated of all the peaks, yet the possibility that a complete astronomical establishment might be one day planted on its summit seemed more like a fairy tale than like a sober fact. It was at that time a wilderness and not even a trail led over it. The nearest house was 11 miles away. The mountain presented numerous advantages on the score of its nearness to San Francisco, the metropolis of the coast, and especially because it was known that the fogs which cover the valley at night-fall, and which last till the sun is quite high the next day, did not, at least usually, extend to the peak. On these grounds chiefly Mr. Fraser recommended and Mr. Lick practically accepted Mt. Hamilton as the site for the future observatory. During the summer of 1876 Capt. Floyd was in Europe, where he met Prof. Holden and visited various observatories, the workshops of Messrs. Grubb, Cooke, Chance and Fiel, and consulted many astronomers. In the autumn of 1876 the third (and present) board of trustees was appointed.

In September, 1875, Mr. Lick had proposed to Santa Clara county to definitely place his observatory on Mt. Hamilton if the county would construct a road to the summit. The proposition was accepted by the supervisors, and the road was completed in December, 1876. A description of this road is given elsewhere in this number of the PRESS. The land for the site of the observatory was granted by Congress June, 1876, and a purchase of 149 acres was subsequently made by Mr. Lick to control the access to the reservation. In 1886 Mr. R. Morrow, whose immense ranch adjoins the observatory reservation on the east, generously presented a tract of about 40 acres, so as to secure the observatory forever against hindrances in close proximity to it.

Mr. Lick died on October 1, 1876. At his death a number of legal questions arose which required some years to thoroughly settle. The time of the trustees was largely occupied with these, though the interests of the observatory

Mr. Burnham, and the other, a standard mercury barometer by Roach of San Francisco, the property of Capt. Floyd, were used for ascertaining the atmospheric pressure.

In the summer of 1879, Capt. Floyd and Mr. Fraser spent a month or more in Washington in consultation with Professors Newcomb and Holden and with architects and draughtsmen. With a detailed survey of the summit of Mt.

pletely across the building from east to west, and is the center or main hall. These rooms all open toward the east into a continuous long hall 12 feet wide and 191 feet long. This hall opens directly into the large dome at the south end, and thus a straight line 270 feet long can be drawn inside the main building, all under cover. This space may be of use in optical experiments. Underneath the whole of the main

THE LICK OBSERVATORY ON MOUNT HAMILTON.

Hamilton as a starting point, a plan for the main building was drawn and adopted by the trustees.

#### Description of the Buildings.

The material for the main building is red brick, made on the observatory reservation at a

building is a shallow space or cellar, which is used for ventilation, for running water pipes, electric wires, etc.

Above the first and principal floor is a continuous attic, directly under the sloping roof. This attic is substantially finished in wood and serves as store-room, etc. At the north end the building is carried up to two complete

prism of hard rock, one foot on the base and from 10 to 32 feet high, it was important to utilize to the utmost the mere standing room.

We may now enumerate the separate rooms, and we will describe those on the lower floor. The ceilings are 16 feet above the floor. Beginning at the north end of the building, the northwest room is circular, 24 feet in diameter. It is the circular room below the small dome. The center is occupied by the brick pier of the 12-inch equatorial. The interior of this pier is hollow, provided with iron doors and serves as a fire-proof safe for instruments. The walls of this room are shelved for storing tools, etc. Next east of the circular room is the north hall, 13 feet 6 inches x 12 feet 6 inches. In this hall are the iron stairs leading to the second floor and the small dome (the north stairs) and also a stairway leading to the cellar below the circular room, which is used as a hattery-room. The northeast corner of the building is a vestibule 13x13 feet. A door in its east side gives access to the transit house. At the north end of the long hall is a window through which the face of the mean-time clock and of two side-reel clocks can be seen from the hall.

Opposite this window is a circular window in the outer wall, through which an observer in the transit house, or in the meridian circle house, can see the clock faces. The first room of the main building is the clock room, 13x20 feet. It contains a pier for the mean-time clock, two piers for sidereal clocks and a brick and cement clock-closet nearly air-tight, with another pier for a clock. The chronometers are kept in this room on wooden shelves suspended from the walls. A chronograph can be placed here and used to compare the various clocks.

The next room toward the south is 15x20 feet, and contains the measuring engine and smaller instruments. It is called the instrument-room.

South of this again is the assembly-room, 30x20 feet. This opens at its southeast corner into a water-closet and lavatory 8x10 feet.

The visitor's room is 12x18 feet, and is entered from the center hall. It communicates with a ladies' toilet room, 8x8 feet. It contains a beautiful pastel drawing of Saturn by M. Tronvelot, presented by Prof. Holden.

The center hall is composed of three parts. The west entrance or vestibule, the center hall proper 20x20 feet, the east vestibule 20x18 feet. The east door is a principal entrance also. The walls and ceiling of this center hall are all composed of cement, brick and iron, and are fire-proof.

South of the center hall and entered from it

Ground Plan  
of the  
Lick Observatory.  
Scale.

were steadily attended to. During the summer of 1879 Mr. Burnham was invited by the Lick trustees to test the site already chosen, for astronomical purposes, by actually making a series of astronomical observations from the summit. Mr. Burnham's report was distributed in 1880. It was the first astronomical contribution of the new observatory. Its conclusions have been amply verified by subsequent experience.

Mr. Burnham used a six inch refractor (made by Alvan Clark & Sons). A set of meteorological instruments for temperature and humidity were furnished from the San Francisco office of the U. S. Signal Service by direction of the Secretary of War. Two barometers, one a large aneroid by Negretti and Zumbra, graduated to hundredths of inches, belonging to

cost of about \$13 50 per M. The cost of hauling brick from San Jose would have been \$22 50 per M., and its cost at San Jose \$9 per M. As about 2 600 000 bricks have been employed in the whole construction, over \$46 000 have been saved in this way alone.

The outside of the building is painted to preserve it from the weather. This building is intended for offices, workshops, etc., and has the small dome (24 feet inside diameter) at its northwest angle, and the large dome (70 feet 6 inches inside diameter) at its south end. The axis of the building lies in the direction N. N. E. and S. S. W.

The general idea of the building is to provide a series of rooms each 20 feet deep, which lie along the west side of the building (facing San Jose). One of these rooms extends com-

stories. The center tower is also two stories high. The tops of the north tower and of the central tower are flat and surrounded by low brick walls. These spaces will serve for placing small instruments. Just north of the large dome the building is also two stories in height.

The ridge of the slate roof is made flat in a roadway some 18 inches wide. On each side of this roadway is an iron hand-rail, so that a continuous walk is provided from the small dome to the large dome. Around each dome there will be a similar walk, similarly protected by a hand-rail. There are thus three independent ways of passing from the small to the large dome: 1st, along the roof; 2d, along the attic; 3d, along the long hall.

In a situation where every square foot of available surface involved the removal of a

is the secretary's office, 13x20 feet. The walls of this are shelved to the ceiling. A fire-proof safe is provided on its east side. Stairs from this room lead to the second story of the center tower.

South of this room, again, is the library, a very handsome room, 43x20 feet, finished with white polished ash cases and tables, and with fire-places for ventilation. It contains shelf-room from 5000 to 6000 octavo volumes, and draws which will hold about 10,000 pamphlets. The secretary's room opens into the library as well as into the long hall.

#### The Library

Also opens with double doors into the long hall. South of the library and opening into it (as well as into the long hall) is the director's office.

This room is 13x20 feet. Toward the south it opens (through double iron fire-proof doors) into the closet for the large objective. The other (south) pair of iron doors of this closet open into the large dome. This closet is intended to hold a carriage, which, in case of fire is to be placed underneath the large equatorial (pointed to the nadir), and to receive the large objective on a soft mattress or cushion. The carriage can then be pushed rapidly inside the closet and the doors closed. Means will be provided for holding the large telescope vertical during this process. The large dome needs no special description here. It is to be 76 feet in exterior diameter and opens into the long hall (through iron doors) at its northeast side. It opens into the closet for the objective described, and into another fire-proof closet just east of that last named. This will contain a sidereal clock and chronograph, and also the machinery for rotating the dome. A reference to the accompanying plan will make the above description clearer.

The cellar of the circular room is fitted as a battery-room. A cellar is also provided under the large dome, seven feet high, which will be fitted with shelving to receive photographic negatives. The rest of the building has only a shallow space four feet or so in height, for purpose of ventilation, etc.

The second or attic floor can be reached by three stairways. The north stairway, which is of iron, leads from the north hall, near the small dome. The center stairway leads from the secretary's room. The south stairway leads from the south end of the long hall to a large room over the fire-proof closet.

On the second floor we have the small dome, 24 feet in diameter. Also a hall entering it which is 14x13 feet, and just above the north hall. The north stairs end here, and double iron doors close the entrance to the attic. Above the north vestibule is the office for the 12 inch equatorial, about 13x13 feet. This room is completely fitted for the comfort of the observer with desks and bookcases. The north attic extends from the north to the center hall. Here it is broken, and to pass to the south attic it is necessary to turn to the east in a small hall which leads to an office-room just over the east vestibule. This room is also fitted as a computing-room. The south attic extends to the north wall of the large dome. Iron doors are provided at all necessary places. The disposition of the roof has been previously described. The roof is accessible by three stairways; in the north end of the building, at the center and just north of the large dome. An observer can also step out of the slit of the large dome on to the gallery round it and on to the roof of the main building.

#### The Dome for the 12-Inch Equatorial.

The objective and tube of the Clark 12-inch refractor was originally made by Alvan Clark & Sons for Dr. Henry Draper, and were mounted in his private observatory at Hastings-on-the-Hudson. The objective is of the very finest quality. It was mounted at the Lick Observatory in October, 1881.

The dome is a hemisphere 25 feet 6 inches in diameter, made of thin plates of nickel-plated

THE DOME FOR THE 12-INCH TELESCOPE.

copper secured to a light framework of wood. It springs from a circular ring of cast iron of the same diameter outside, which has on its lower surface a track three inches wide. A circular bed-plate with a double turned track rests upon the cylindrical wall of the tower, and supports a "live ring" containing 14 wheels, each

consisting of three separate wheels, forming conical fuses about 10 inches in diameter, turning on the same axis. The dome is supported by this live ring, the exterior wheels traveling upon the double track of the bed-plate, and the interior wheels upon the broad single track on the bottom of the ring which forms the base-

plate of the dome. The slit for observation is three feet wide and extends beyond the zenith. The shutter is a curtain of thin corrugated steel, which is wound upon a drum at the upper end of the slit by ropes which can be reached from the floor. This arrangement has, however, been found unsatisfactory, and will be replaced by rolling shutters to be furnished by Warner & Swasey. The mechanism for revolving the dome is novel, simple and efficient, and is the invention of Captain Floyd and Mr. Fraser. An endless wire rope passes around the outside of the dome just above the base-plate, over guiding pulleys and down around a groove in a two foot wheel placed in a recess in the wall of the room below. This wheel is rotated by a crank geared in the proportion of 3.1, and the friction of the rope on the outside is sufficient to turn the dome. To give the dome a complete revolution requires 41 turns of the crank, and it can easily be effected in less than two minutes. The approximate weight of the dome is eight tons.

#### Meridian Circle House.

The meridian circle house, completed in 1884 from the design of Professor Holden, is 43x38 feet, with a wing 27x11 feet on the east. The walls are double throughout. The outer frame carries a Louvre work of galvanized iron, which completely prevents the sun from striking any part of the building proper. The inner walls are of California redwood, which is almost incombustible, and between these and the outer walls is an air space 24 inches wide, which extends completely around the building. The ceiling is also of redwood. It is 16 feet above the floor, flat in the center of the room, and arched over to connect with the side walls. A very large air space above the ceiling communicates with the room itself through wire netting which covers the sides of the observing slit, and complete access to any part of the air spaces, both of the walls and of the roof, is provided by doors opening into the interior room. On the west the room opens into a ventilating tower two stories in height, which also adjoins and is connected with the house for the meridian transit instrument, which lies still further to the west. The design of this construction is to keep the temperature of the two houses and of their air spaces precisely the same as that of the external air, and it is probable that this object has been practically attained. The upper room of the ventilating tower ought to furnish an admirable exposure for meteorological instruments.

The wing on the east side projects 11 feet from the main building, and contains an office-room for the observer with the meridian circle. This room, which communicates with the meridian circle house by double glass doors, is provided with closets for small instruments, and is comfortably furnished for its purpose. The remaining part of the wing forms a recess which receives the rolling canopy of the meridian circle when the latter instrument is in use. On the west side of the room is a closet with glass doors, which contains the Dent sidereal clock No. 1847.

The piers of the meridian circle are of brick. Each is 33 inches square where it passes through the floor, and tapers to 23 inches at the top, the inside faces being vertical. The height of the piers above the floor is 4 feet 10 inches. Platforms surrounded by hand-rails, and provided with seats are arranged for the convenience of the observer at the microscopes.

The piers for holding the north and south collimators are 6 feet x 7 inches x 2 feet 10 inches at the floor level, tapering slightly toward the top, and 5 feet high. The ends facing the meridian circle are 22½ feet apart. These piers, as well as those of the central instrument, are cased in polished Spanish cedar. A narrow platform, 25 inches above the floor, is supported by brackets on the east and west sides of the casing of each pier, and is extended on the north (or south) to the inner walls of the building, giving easy access to the eyepiece of the collimator. Steps lead up to these platforms on both sides.

The east and west collimators are mounted on piers 3 feet 10 inches x 2 feet 9 inches at the floor and 6 feet high. The ends facing inward are 24 feet apart. The arrangement of casings and platforms is much the same as that for the piers just described. A double steel track extending between the north and south collimator piers receives the wheels of the observing couch, the reversing carriage and the mercury artificial horizon, and a single track extending eastward from the west pier of the meridian circle supports the canopy which protects the instrument from dust when it is not in use. This canopy is 10 feet 6 inches and 11 feet high. It is built of white ash and cedar, and each side is formed of four large plates of glass. The ends are closed by heavy curtains. The slit for observation is 3 feet 4 inches wide. At the north and south it is closed by double shutters 20 feet high, and overhead by four shutters each 25 feet long and 2 feet wide, hinged at the sides of the slit and opening outward. Four ropes pass-

THE 12-INCH TELESCOPE IN THE NORTH DOME.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**FREE GOLD.**—Amador Dispatch, June 16: We have been handed some specimens of rock taken from the Live Oak mine, about two miles westerly from town, owned by Messrs. Parker, J. K. Thomas, F. Walker and Harry Seymour. The specimens handed us are well sprinkled with glittering specks of free gold, and show the mine to be one of value. The owners of this mine are local residents and have done their own work on the mine.

**KENNEDY.**—Amador Ledger, June 16: The sinking of the main shaft is making satisfactory headway; the total depth is now about 1100. It is not yet fully decided whether the sinking shall be prosecuted 100 or 200 feet deeper. A station for a new level will be cut at the 1052 level. The mill is kept running steadily, to as much of its capacity as the sinking operations will admit. Last month 2160 tons were crushed, the ore mainly coming from the 750-foot level. The cleanup amounted to \$2000 in free gold, and the sulphuric acid will give about \$2300 more; making a total of \$11,500; or an average of \$5.20 per ton. This is considered a very satisfactory result. The mine is unquestionably on a solid basis for permanent working. The ore chimney is over 400 feet long, and the best ore obtained from the deepest levels, leading to the conclusion that even better results than any heretofore obtained may be looked for when new levels are opened in the sinking now in progress.

**AMADOR GOLD MINE.**—Ginocchio Bros. have received orders from the Amador gold mine for 40,000 feet of lumber, for the construction of the mill to be erected on that mine. We are informed by Mr. Minear that the mill will be built under two or three separate contracts. One contract covers the iron work and machinery; another calls for a supply of lumber, and a third will be let for the erection on the ground. A thoroughly experienced millwright has been consulted, and will no doubt be employed to look after the latter work. The stamps are to be 850 pounds each, and are estimated to crush from 2½ to 3 tons each every 24 hours. To accomplish this result, it is intended to put in a rock-breaker of a new and improved pattern, that will crush the ore considerably finer than the ordinary breakers.

**SUTTER CREEK MINE.**—For the week the superintendent reports this mine has extracted 75 tons of ore and milled the same from crosscut No. 7. Ore on track floor harder and higher grade. Assays ranging from \$3.50 to \$5.50 per ton. Cutting out a station for crosscut No. 2, 100 feet further north on ledge.

**MISCELLANEOUS.**—S. S. Granger, in prospecting in the neighborhood of Pine Grove, struck a rich pocket-ledge on the ranch of W. K. Harding; some of the ore is estimated to be worth \$500 per ton. A. P. Minear, when in San Francisco lately, ordered an air compressor for the Amador gold mine. The machinery is now in process of construction. It is intended to run three drills. It is reported that sinking operations will be commenced at the Zeile next month. If correct, it will necessitate the laying off of a number of hands, as only a portion of the mill can be kept running while sinking is in progress.

## Calaveras.

**CALIFORNIA MINE.**—Calaveras Chronicle, June 16: We were shown some very rich rock which was recently struck in the California mine, located about three miles from Railroad Flat on the South Fork of the Mokelumne river. The tunnel in which the ore was struck is in about 100 feet. Another tunnel above had been run some 70 feet, and an "upraise" is being made from the one to the other. The ledge is 14 inches wide and very rich in free gold.

**WASHING TAILINGS.**—Sam Pearsall and Joe Leboy, Jr., have sluices set and commenced washing the tailings of the Corral Flat mine.

**GOOD ROCK.**—Calaveras Prospect, June 15: The success which sometimes comes to reward the patient industry of those who spend years of toil in mining, has never been more well deserved than the good luck which is now an assured fact to the owners of the McCreight & Hardy mine, at Albany Flat near Angels. Yesterday we had the privilege of inspecting some specimens of gold mixed with quartz, taken from this mine, that seemed to excel in richness anything in this line ever taken from the treasure vaults of old Calaveras. But we do not make our report on specimens alone. The mill is now running on rock which for the past ten days is yielding bullion at the rate of \$1500 per day, running time.

## Contra Costa.

**THE COAL MINES.**—Contra Costa Gazette, June 13: Work is being pushed ahead at the coal mines and everything looks favorable for a lively summer. The West Hartley near Jucosville has been sinking a slope of about 400 feet, and a new railroad has just been completed from Empire to this mine. The slope has been driven down between the two veins of coal, and after sinking a hundred feet further, tunnels will be driven back to the veins. The coal from this mine is of a good quality and is transported by rail to Antioch. At Central new machinery has been put up and the company are sinking deeper on the lifts. Steam was gotten up for the first time yesterday and the new machinery will hoist coal immediately. The smoke stacks are on the ground at the old Independence shaft at Somersville, and the boilers are daily expected to arrive. Work will be pushed ahead at this mine and when some hundred feet of water is pumped out of the old shaft the old Clark vein can easily be reached and worked. This vein is said to contain the finest coal in the district, and is known to be very large and easy to work. When once under way this enterprise will live up to Somersville and employ many men. Mr. Jas. Dickinson has taken a contract to sink another lift in the Stewartville mine, and will place the coal in the bunkers at a stated price for Belshaw & Co.

## Montsrey.

**SLACK'S CANYON COAL MINE.**—San Miguel Messenger, June 15: Your correspondent visited the Slack's Canyon coal mines recently. Work was be-

ing pushed on in a brisk manner, and everything evidenced the ability of the superintendent in the working of these valuable mines. Long before arriving on the grounds the visitor sees the huge clouds of smoke looming up, making the place easily identified at a great distance. One tunnel is now in 1200 feet, all of which, except 150 feet at the entrance passes through a solid mass of coal. Three other tunnels are in from 200 to 300 feet and the coal becomes of better quality the farther they penetrate. These mines are in Monterey county, near the headwaters of the creek that flows down Indian valley, which we believe will be the most practicable route for a railroad connecting the mines with San Miguel.

## El Dorado.

**MILL.**—Georgetown Gazette, June 14: We understand that a three-stamp mill is being put up on the old McKusick mine near Volcanoville.

**JOSEPHINE.**—The new concentrators for the Josephine mine are at Auburn station, and will be brought up in a few days. J. M. Nobgues is building a sawmill at Mt. Gregory. It is said that the mill is for his own convenience as he is using a large amount of lumber at the Josephine and other mines which he is operating in that section.

## Nevada.

**THE SPANISH MINE.**—Herald, June 13: The Spanish mine, near this city, is on the Providence and Merrifield lode, on the north extension of the North Merrifield. It has been partially worked in the way of development, for nearly 15 years. Just enough has been done to prove that it is a valuable claim, and no more. There is a tunnel now being run which is showing a body of ore about four feet in width, and which looks well. The workmen have out about 64 tons of ore, which experts say will pay. The owners of the Spanish have been discussing the property of erecting a mill this season.

**THE MULLER AND WALLING MINE.**—Herald, June 13: The lessees of the Muller and Walling mine have their hoisting and pumping apparatus up and in working order. They have the shaft, which is down 40 feet, all cleaned out and repaired and are now ready for sinking. They use an overshot water-wheel. The machinery they think is capable of sinking and pumping to a depth of at least 250 feet. The ledge in the bottom is about 14 inches in width and rapidly widening out. It will be remembered that this claim is the northern extension of the Nevada City mine.

**MINING AT MOORE'S FLAT.**—Grass Valley Union, June 16: S. L. Blackwell, who was in town yesterday, said that the mining prospects at Moore's Flat were improving, as several of the old mining claims are being opened up as drifting claims, by the driving of tunnels, and if it is found that the ground is sufficiently rich to work by that process, quite a large force of men will be employed within the next year. There are more men engaged in mining now in that vicinity than there were last season. At Graniteville there has been a considerable increase of population through the quartz operations, and times will be lively through the coming season. Moore's Flat is also to receive benefit from quartz operations as there are plenty of veins in that vicinity from which good prospects in gold can be obtained.

**PLANET.**—Grass Valley Union, June 17: The Planet mine is situated in the Lowell Hill mining district, in this county, and has been worked as a drift gravel mine for the past 15 years. A tunnel 2800 feet long has been driven toward the channel, and the company are now confident that it has been reached.

**THE ORIENT MINE.**—North San Juan Times, June 15: In the vicinity of and about a mile from Nigger Tent is a gravel claim called the Orient. Its owners have formed themselves into a company, have levied an assessment and proceeded to satisfy their suspicions as to the existence of pay dirt in their mining property. Among others, John German and H. H. Buhning of this town are interested in the scheme and have at present four men at work in its development. The gravel channel is being looked for by means of a tunnel run into a hill on the claim, and at present writing, progress of 90 feet has been made, but it is expected that at least 700 feet more will have to be added to this before gravel is struck in paying quantities. The tunnel is in good picking ground and the Orient Co. are satisfied with the headway being made. Such action on the part of men who, in a business way, have been injured by the suppression of our neighboring hydraulic mines, shows that they will not "down at Caesar's bidding," but are going to see if it is possible for them to live things up a little by opening a mine that will be a source of revenue to its projectors and also afford occupation for some of the many idle miners in this section.

**A RICH GOLD FIELD.**—Nevada City Herald, June 13: There is a gravel channel back of this city which has produced about \$3,000,000, and about all the ground worked to secure that much bullion was comprised in a patch of ground less than 3000 feet in length. The same channel extends up the ridge and there is little doubt of it not being as rich most of its length as it was where this money was taken out. Remember that the amount mentioned was extracted by drift process over 28 years ago. The channel has lain idle, practically speaking, ever since that time. There are millions of dollars sleeping up there to-day, and only waiting to be mined to distribute themselves into the channels of trade. There is ground there that can give profitable employment to hundreds of laboring men at the best rates of wages. The Manzanita mine owners started in last season to develop parts of their ground. They have worked quietly and have all this time been doing dead work necessary to the putting on a force of men. We understand from the best authority that they have ground now opened that will yield \$100,000 to the owners, when washed. There are other claims as good, or better. That old channel will yet make this place very lively and prosperous.

**WASHINGTON.**—The prosperity of this section depends wholly upon mining. Capital invested in mines here in the past has hardly ever failed to bring in good returns. The Yuba and Eagle Bird have long been paying mines and have grown better as the depth has increased, while the Blue Bell and Washington mines, both of which were started last year and are paying well, prove that good ore is not confined to one or two ledges. It is claimed that the rock at the Erie yields \$12 per ton, and it is easily worked. So with a reasonably good prospect

capitalists need not fear to invest their money in Washington district. Those who wish to invest in mining cannot do better than to visit this district and see for themselves what is being done and can be done.

## Placer.

**SUNNY SOUTH.**—Cor. Placer Herald, June 16: The famous Hidden Treasure mine continues to declare its regular monthly dividend, and never looked better. They are running on an average 375 carloads per day, and are working quite a force of men.

## San Diego.

**BANNER.**—Julian Sentinel, June 16: The ball is rolling for a big mining boom in Banner, at last everything points that way; new mines are being discovered and old ones opened up. The Ready Relief mill is now running over 100 tons of ore from the mine. Coffman & Redman have 15 tons on the dump ready to crush. The Cincinnati has 10 tons on the dump—very rich ore. The Hidden Treasure is booming up, being worked by some Colorado men. Will Meiner is opening up his mine, the extension of the Cincinnati. Davis & Walker have their tunnel on the Worlock in about to the ledge, and will soon be taking out ore.

## Shasta.

**FROM IGO.**—Cor. Shasta Courier, June 16: It is reported that Senator Forster has sold his Bullychoop mine to an English company for \$600,000, which may make quite a stir in mining circles this season. The Astras on South Fork are all running on average rock. Bennett & Shaw have bonded the Woodfill mine on Andrews creek, and are prospecting the same. The Hardscrabble mine has made its final cleanup for the season, which was very satisfactory.

**FROM LOWER SPRINGS.**—Conant & Co. have made several runs upon ore from different ledges here. The quality as well as the quantity is satisfactory to all concerned, and many batches from other mines are waiting their turns. Conant & Co. are now prepared to work ores by a dry crusher. They will then roast and work through pans. Their process includes only rebellious ores. They also have a wet crusher. The particles pass over copper plates and over Dodge concentrators. But what we miners are praying for is a first-class pan or pulpmill in our midst. The reduction works at Redding are six or seven miles from our most valuable ledges. We have a large quantity of low-grade ore in and about our camp, and the gold being very fine will require a pan and settler process in order to work the ore up to a high percentage. This latter process is required at least on ores from the croppings. When we reach the water level the ore will carry a much higher percentage of sulphurets and will require concentrators. The gold ore upon our croppings is very fine and is of a rather free-milling proposition. This pan process works well on all croppings of ore. It matters not if the ore is a little rebellious. We are waiting patiently for some moneyed party to erect a first-class mill that will save our gold up to the proper per cent; then our miners, with renewed vigor, will pitch in and demonstrate to the public that we have mines here in this partly forgotten camp.

## Sierra.

**RICH ROCK.**—Mt. Messenger, June 16: We learn that very rich quartz has been found in the Alaska mine, richer if possible, than any hitherto found. We learn that some very good rock has been found in both upper and lower tunnel at the Forest Queen Quartz Mine. Dr. Biber has charge of this mine, Geo. Fries being foreman. Prospectors and capitalists are rather numerous this spring in Sierra county.

## Trinity.

**EAST FORK ITEMS.**—Trinity Journal, June 16: Capt. Trueworthy returned from East Fork and gave us the following items: Work is being done on the Belle mine in the way of running tunnels and development; the ledge is six feet wide and carries free gold and sulphurets. The prospect of the mine is favorable. Development work is also being done on the Grizzly. About 50 tons of ore on the dump at the Star mine; these three mines are near Barney gulch. Day & Moor are crushing ore from the Ozark. The Enterprise owners are also crushing ore from their mine. There is considerable ore on the dump of the Thanksgiving. Frank Moor has taken out about 25 tons of ore from his ledge. Work is progressing on the Orland. The owners of the Webfoot have run in two tunnels on their mine and have the ledge in each; they have a good property. The North Star, on which work has been suspended for some time, has been cleaned out and work will soon begin upon it. The need of the district is a wagon road and measures are now being taken to complete the road already begun.

**KNOW-NOTHING CREEK MINES.**—Journal, June 16: Mr. D. Hansen reports favorably on the outlook for this camp and is well pleased with his investments there. The Hansen mine is looking well and the company is doing a great amount of work on it. They are now principally occupied in running a 300-foot tunnel to tap the ledge at the depth of about 200 feet; 282 feet of the tunnel was completed when Mr. Hansen left and they expect any day to reach the ledge. They have purchased an arastra to be used exclusively for crushing ore from that mine and enough will be taken out to keep the arastra running constantly during the entire summer. Crushing will be commenced next week. The ledge in the Know-Nothing mine averages about 18 inches and is showing satisfactorily to the owners, under the superintendency of Mr. P. P. Black, an experienced miner. Arrangements have been made to put up a 4-stamp mill which will be kept running on the large quantity of ore now on the dump and in sight. Two shifts will be worked from this time so that hundreds of tons of ore will be deposited on the dump by the time the mill is completed. They now have a tunnel in about 100 feet and it will be run still farther in order to give them plenty of stopping ground so that no difficulty will be experienced in keeping the mill running. A ditch will be dug to take the water from the creek to the mill which will enable them to run during the entire year. Radefinger, Hansen & Co. have several good locations in the district. The Gold Run is receiving their attention particularly at present, and the ore which they are crushing in their 4-stamp mill is giving satisfactory results. They have the mine in good working condition and the ledge is looking well. Several discoveries have been made recently which promise well and it is expected that many miners and prospectors will find their way into the camp during the summer

months. There are now 35 men in the camp and as soon as the new mill is set in motion it is likely that a few more experienced miners will be given employment.

## Tuolumne.

**BEGINNING WORK.**—Sonora Democrat, June 16: Messrs. Chas. Smith and Henry Wilson will in about a week be ready to begin operations on their Brown's Flat claim. Mr. Geo. Meade the millwright, is putting in a fine little hoisting plant. It is estimated there is over a hundred feet of vertical fall, and that seven inches of water will run the wheel which is designed somewhat after the manner of the Knight wheel. From Mr. J. Hagan, Supt. of the Buchanan mine, we learn that everything is going ahead with vigor and energy. The shaft is now down to a depth of 700 feet and drifting is going on both east and west. The body of ore is very large and highly sulphureted. It all averages well in free gold. The chlorination works are getting well under way and the brick kiln which will do about the 4th of July, will furnish it is estimated about 60,000 brick. The works will be completed by the 1st of August. The concentrations now amount to 350 tons, and the assays denote that they will pay \$150 per ton of 2000 lbs.

## Ventura.

**AS GOOD AS COAL.**—Ventura Free Press, June 16: Owing to the amount of water encountered in sinking the shaft at the coal find, work has been temporarily suspended, but the owners thereof have not been idle. They have been developing a strata of bituminous rock which is likely to prove of almost if not quite as much value to the owners as a coal mine. Specimens of the bitumen have been submitted to test and found to be superior to any other now in use on this coast. Mr. Perine, who has the contract for paving State street in Santa Barbara, and who has used all the varieties and qualities of bitumen now used in this State, has examined specimens of this Ventura product, and pronounces it of superior quality. He offers \$11 per ton for it at a venture. Others who profess to be judges of the article say it is worth \$18 per ton. The indications now are that there is an abundance of it. Mr. Perine, the Free Press is informed, will visit Ventura in a day or two with a view of organizing a company to work the quarry and to develop it.

## Yuba.

**RICH GRAVEL.**—The Marysville Appeal, June 15: "S. O. Gunning has returned from a trip to Smartsville and vicinity. While there he visited the Blue Point mine, which is owned by six Marysville gentlemen, and expressed his belief to an Appeal reporter, that they had struck the richest pay gravel that had ever been handled in Smartsville. The reporter then called on J. A. Sneed, who is interested in the mine, and from him obtained a brief statement: 'We have gravel enough ahead,' said he, 'to do three years' good work, but we want to get more than that, and want to prosecute until we have found which lead will pay best. John Dunne is up there now with about ten men. In the last eight days he has taken out over \$500 by the arastra process, which is talking pretty lively.'

## NEVADA.

## Washoe District.

**SIERRA NEVADA.**—Virginia Enterprise, June 16: Repairs to the south drift on the 520 level still continue. The timbers were a good deal broken and required easing in most places along the drift.

**KEYES.**—Are sinking the main shaft to a greater depth.

**CHALLENGE.**—The raise from the 1100 is in ground of a favorable character.

**SEG. BELCHER.**—The east drift from the 1300 raise is in quartz giving fair assays.

**UNION CON.**—No. 1 east crosscut on the 1300 level still continues in vein porphyry.

**MEXICAN.**—East crosscut No. 1 on the 1300 level is in a mixture of porphyry and clay.

**BULLION.**—Good headway is making in the drift started south from the 640 level winze.

**OEST.**—The ore breasts are looking and yielding well. The ore is being worked at the Briggs mill.

**MONTE CRISTO.**—Good headway is making in the drift extended to connect the new and the old shafts.

**BALTIMORE.**—The drifts on the 380 level are being cleaned out preparatory to the resumption of work.

**POTOSI.**—On the 500 level the north drift is out 579 feet. The face still shows quartz of a promising character.

**SCORPION.**—The south drift on the 300 level is out a distance of 327 feet. The face is in hard vein porphyry.

**CROWN POINT.**—A southeast drift has been started from the 700 station to connect with work down from the 600.

**CONFIDENCE.**—Are shipping daily to the Brunswick mill 186 tons of ore, the battery assays of which average \$27.05 per ton.

**HAYWOOD.**—Good ore is being found below the 300 level in the deepest workings. The Thompson mill, Lower Gold Hill, is being run on ore from the mine.

**IOWA.**—The south drift from the east drift has been advanced 35 feet; total length, 60 feet. The face is still in vein matter of a promising appearance.

**ANDES.**—Are running south from the east crosscut on the 350 level in a very good looking quartz. Are sinking a winze on the 240 level 700 feet north of the main shaft.

**WEST YELLOW JACKET.**—The car track in the northwest drift is completed. The drift is now in a distance of 64 feet. Good ore is coming in at the bottom of the drift.

**UTAH.**—On the 372 level, opposite the south drift, a north drift has been advanced 38 feet. Formation quartz giving low assays. The face of the drift is showing some value by assay.

**BEST AND BELCHER.**—The northwest drift started from the main west drift has been extended 45 feet; total length, 250 feet. The formation is quartz, showing some value by assay.

**ALPHA.**—The north lateral on the 382 level is out 287 feet. The face is in clay and quartz. The east crosscut in the north lateral drift is out 47 feet. The

face is in clay. The west crosscut in the north lateral drift is out 41 feet. The face is in quartz. Have commenced to sink to the 500 level. The formation has a favorable appearance.

**ALTA.**—The ore reserves on the 825 and 1150 levels are yielding their usual quota of ore, which is being reduced at the mill. All the machinery is running smoothly, and the mine is looking well.

**OPHIR.**—On the 1465 level are still retimbering the south winze down from the 1300 level to the point of its connection with the east crosscut run from the end of the southwest drift from upraise No. 2.

**LADY WASHINGTON.**—Are raising from the 725 level, and are now up a distance of 342 feet in clay adjoining the veins. Are crosscutting from the raise at a height of 110 and 210 feet above the 725 level.

**BELCHER.**—The 500 west crosscut advanced 25 feet during the week, making the total length 77 feet. The face is in soft porphyry. The 1300 raise advanced 15 feet in quartz assaying from \$10 to \$12 per ton.

**CHOLLAR.**—The north drift on the 550 level is in 386 feet. The face is in low-grade quartz. The north drift on the 450 level is in 538 feet. The face is in quartz averaging \$20 per ton, which is being worked at the Nevada mill.

**YELLOW JACKET.**—About 90 tons a day of gold quartz is being shipped to the Santiago mill. Good headway is making in the work of opening out the 800 and 900 levels, from which the country between the Jacket and Imperial shafts will be prospected.

**GOULD AND CURRY.**—The southeast drift started from the top of the upraise from the drain tunnel has been extended 43 feet; total length, 85 feet. The formation is porphyry and quartz. During the week there have been extracted from the 250 and 300 levels and shipped to the Douglass mill 222 tons and 1500 pounds of ore, the battery assay of which averaged \$21.52.

**CON., CAL. & VIRGINIA.**—The stopes in the vicinity of the winze sunk below the 1425 level are yielding a large amount of good ore. The 1500 level upraise from the end of east crosscut No. 1 is still yielding well, and all the stopes of this level continue to show good ore. Upraises Nos. 1 and 3 from the 1600 level continue to yield well. On the 1550 and 1650 good prospects are being obtained. The usual amounts of ore are being shipped to the Eureka and Morgan mills and the average assays will be about as usual.

**SAVAGE.**—On the 400 level are stoping ore from the north and south drifts. The south drift was connected with the north drift from the Hale and Norcross on the 11th instant. On the 500 level the main west drift from the shaft has been advanced 32 feet in a fine body of quartz that gives some good assays. Have started a drift south on this quartz body, which is now advanced 12 feet in ore that averages by assay \$35 a ton. From between the 400 and 900 levels are extracting 80 tons of ore a day. Have shipped to the Rock Point mill 541 tons, the average assays of which is \$22 a ton.

**HALE & NORCROSS.**—During the week have hoisted 1650 tons of ore from the 600 and 900 levels, and have shipped to the Mexican mill 900 tons and to the Nevada mill 535 tons of ore, the assays of which average \$34 per ton. All the stopes throughout the mine are looking well. Have commenced to extract ore from the new upraise from the end of the main drift west on the 700 level. The upraise is now up over three sets in fine ore. The north drift on the 400 level has connected with the south drift from the Savage. The drift shows ore of a fair grade. The total number of tons of ore worked last month was 5925, which yielded \$169,685.98. Bullion on hand and previously shipped this month, \$32,000.

#### Tuscarora District.

**NAVAJO QUEEN.**—*Times-Review*, June 16: South-west drift from crosscut 200-foot level advanced 15 feet during the week. No material change to note.

**NORTH COMMONWEALTH.**—The shaft has been sunk and timbered to the depth of 76 feet. A crosscut started and extended 20 feet. Indications are favorable.

**DEL MONTE.**—The tunnel has been extended a total distance of 176 feet. Work has been discontinued in the face for the present and a crosscut started 76 feet from the face.

**BELLE ISLE.**—The old stopes continue to yield some medium-grade ore.

**NAVAJO.**—South drift from No. 4 crosscut advanced 6 feet; and crosscut west 9 feet, south drift on winze on east vein 250-foot level has been advanced 11 feet.

#### Eureka District.

**ORE SHIPMENTS.**—Eureka *Sentinel*, June 16: The following number of tons of ore were shipped from the mines of the district to the furnaces during the week: Dunderberg mine, 68 tons; Ferrell, 63½ tons; Allen, 3 tons; White Pine, 6½ tons; Dimmick, 20½ tons; El Dorado, 5 tons; Woodchopper, 20½ tons; and Silver Lick, 20 tons. From the Bowman, 3 tons and Silver Lick 9 tons.

**A FRESH STRIKE.**—Bob Northy, the Greenwood brothers, and others have lately been interested in two tribute pitches in the Silver Lick mine at Adams Hill, one adjoining the other. Several days ago one party struck ore close on the boundary line of the two pitches, and rather than quarrel the parties agreed to all work together under an agreement among themselves. They are down in a deposit of ore about ten feet, and so far it shows up about five feet thick, and they have ore all around them. We learn that they took out five tons in a half shift, and it made only a comparatively small hole in the deposit, the extent of which is not yet known, but it is said to be the best thing uncovered in that locality for some time past.

#### ARIZONA.

**AROUND PRESCOTT.**—*Courier*, June 14: Kerr mill, in Weaver district, is ready to run. Judge John J. Hawkins, resident agent for the Etta M. & M. Co., has a letter from Supt. Johns, telling him that the stamps are pulverizing 20 tons a day. Mine producing gold-bearing rock. Machinery for Copper Basin is arriving by rail. We have samples of the ore that will go 75 per cent copper. If we are not greatly mistaken, the property is a good one and will help make Prescott a large town. The force at the United Verde and Copper Basin mines will be

increased in a short time. A bar of placer gold, worth \$114 was yesterday shown us at the bank of Arizona. It was brought up from Kirkland valley by Win. Rudy. Talk is that Messrs. Brann & Mitchell have sold mines in Turkey creek district to Thos. S. Morgan of New York, for \$25,000. Mr. Tracey, who owns the richest placer mine in the county, was here recently with a few handfulls of nuggets. Wm. Jennings' Onetime mine, Hassayampa district, is five feet wide; has a three-foot pty streak, which yesterday assayed \$59.12 gold, and \$7.76 in silver to the ton. It is opened to a depth of 20 feet. N. C. Shekles made us feel good yesterday, while telling of fine ledges of gold and silver-bearing rock near Bradshaw Basin. Mr. Place is putting on more miners. He will sink a large working shaft at boundary of Crowned King and Moody & Place mines. The Ora Billa Co., in same section, are meeting with good success. Dan O'Boyle has brought in another big bar of gold from the Montgomey mine. Judge Rush and Mr. Ed. W. Wells, who recently returned to Prescott from Eureka district, say that they were more than pleased with Riggs & Lawler's Hillside mine. Never before had seen anything so rich.

**BIG BUG DISTRICT.**—*Prescott Courier*, June 12: Big Bug will soon be a booming camp. The completion of the Van Name quartz mill with the continual improvement of the mines, as development goes on, will surely bring a golden reward to all those that have faithfully kept to work. The mill, with just such old-time, practical men to run it as Mr. Charles Bassett, with the mineral, wood and water in abundance, is just what will make a good camp and put money into circulation.

#### COLORADO.

**GOLDEN SMELTING WORKS.**—*Denver Republican*, June 14: The Golden Smelting Works, probably the oldest smelting plant now in operation in this State, is doing good work, notwithstanding the fact that the smelter is rarely mentioned in the press of the State. The establishment has in use two shaft water-jacket furnaces, two calcining furnaces and three fusing furnaces. The last five furnaces are modifications of the ordinary reverberatory furnaces. The ore supply of the Golden smelter is derived largely from the mines along the Clear creek canyon, above the town of Golden, although some ore is also purchased in the Denver ore market, and occasional large contracts are made with Leadville mines producing sulphides ore. Owing to the general refractory nature of the ore treated at these works, its capacity does not exceed 50 tons a day. The product of the furnaces is usually of very high grade, the last lot of base bullion averaging \$1000 per ton, about one-half of the value consisting of gold. R. Koenig is manager of the affairs of the company and F. W. Clark superintendent.

**COLORADO SMELTERS AND MILLS.**—There are now about 42 water-jacket silver-lead furnaces in blast in this State, reducing on an average about 1650 tons of smelting ore a day. There are also five reverberatory furnaces, running on copper ore, reducing 125 tons daily. In addition to the above there are innumerable reverberatory furnaces, employed in calcining and fusing ore preparatory to smelting. There are also in use in the State about 1000 stamps, exclusive of concentrating mills.

#### DAKOTA.

**HARNEY PEAK TIN.**—*Rapid Republican*, June 10: A prominent citizen of Rapid, in the metropolis yesterday, informed a reporter for the *Pioneer*, that on one day last week the Harney Peak company paid out \$40,000 cash, for the purchase of tin locations, and for the privilege of renewing bonds now held by it, on tin locations in Pennington and Custer counties. The inference is that the much talked deal will yet go through, despite the fact it has dragged these many months. The appearance of several persons in the city yesterday who are said to be from London, England, and interested in the Harney Peak tin deal, caused considerable discussion on the street concerning the present attitude of the Harney company in relation to the tin interests of this section. The general impression is that the movement indicates that arrangements are being made for the commencement of work under the auspices of the English syndicate, and that the final papers of transfer from the American company have been or are about to be made. It is pretty well settled that nothing has occurred to discourage the English company from participation in the profits of tin production in the United States, and we believe that the delay which has been experienced by the people of the Hills in the development of the tin industry is due to the slow character of the English mind and the grabbing disposition of the American mind. The Americans did not care to develop until they had gobbled everything, and the English were slow to act until everything had been gobbled. Once started, however, there is every incentive to rush things.

#### IDAHO.

**SILVER MOUNTAIN DISTRICT.**—*Idaho Statesman*, June 9: They are working 80 men there now, 14 in the mines, the rest in the mill; the mine 300 feet below the surface is 30 feet wide, and they are not through yet to the opposite wall, so they do not know exactly how wide the mine is. The average ore assays \$50 to the ton, mostly silver. They expect to get the mill in operation by the latter part of August. Gold Hill and Banner mills are undergoing repairs, and will not start up under three weeks. The placer mines of Boise county have produced only about one-fifth of last year's yield, owing to the scarcity of water. The Alturas mill at Rocky Bar has run 50 stamps the past week, and has ore to keep them running. They expect to make a clean-up on this run of \$15,000 or \$20,000. The Wide West and Pine Grove mills are pushing the work along as fast as they can get lumber.

**CEUR D'ALENE.**—*Wardner News*, June 11: As the summer advances a pleasing change is visible in the appearance of all things on the South Fork, and we opine before the season is over we will witness a phenomenal growth in all our towns and a corresponding increase in all our business relations. The development of the mineral riches of the country will warrant a rapid increase in our population as they daily present opportunities for greater and more immediate profit. A gratifying fact, and one

that argues well for the substantial growth of the country, is that the people here have abiding faith in the future. They are thoroughly impressed with the immense possibilities of the country, and they are showing their faith by their works. They have set their stakes far in advance and are advancing steadily toward them. Now, that new lines of railroads are an assured fact and will reach this section, connecting it directly with the railroad system of the country, we may reasonably look for a genuine boom in all directions. The tide of immigration is wending its course in this direction, and the numbers of people constantly arriving are of that class most desirable in a mining country. Experienced miners from all directions are commencing to appear, and the universal opinion expressed by all is more than favorable to the outlook of our mines.

**SEAFOAM.**—*Keetchum Keystone*, June 16: W. H. Greenhow and J. K. Morrell returned from a protracted visit to the Seafoam and Sheep mountain countries last Wednesday. They visited and took specimens from every prospect and mine of importance in the new districts and returned with the unwavering conviction that there is sufficient actual mineral wealth there to warrant a genuine boom in the near future. They are well pleased with the result of their journey and thoroughly convinced of the reported richness of that country.

#### MONTANA.

**WEST OF ANACONDA.**—*Review*, June 14: The district west of Anaconda is now giving very substantial testimony that the good things said and published of it for the past three years in the *Review* were true. There has been two or three very important strikes during the past 10 days. The ore which is the most unexpected to the public is the ore in the river vein, owned by Oleson, Vinyard & Murray. The mine is in Oleson gulch, about nine miles west of Anaconda, and is close to the Stormway, the Silver Chain and the Antelope. The mine has only been worked a short time, the shaft being down but 100 feet, and the vein which they have been following from the surface has widened to 18 inches of ore which runs 200 ounces. In character the ore closely resembles that of the Silver Chain and Antelope. The discovery of this lode at the distance it is from these other two claims is proof conclusive that there is a continuous body of ore there and that ere long we will be able to announce other important discoveries in this district.

**TWO THOUSAND TONS PER MONTH.**—The Boston and Montana plant at Meaderville is now running in full blast for the first time, the last furnace having been started up to-day. Supt. Couch says the works will now make an output of 2000 tons of matte per month.

**HARRIS AND LLOYD PROPERTIES.**—The lead at the bottom of the shaft in the Harris and Lloyd tunnel has been crosscut 180 feet below the tunnel and is found to be about 40 feet wide. It is considerably broken, but they have some five or six feet of ore. Work commenced yesterday in sinking another 100 feet.

**LITTLE NELLIE.**—We announced last week that there was a report that a rich body had been struck in this mine, and the report proves true. The owners have very little to say, saying to us: "there is time enough by and by;" but it is known they have a vein about 18 inches, similar in character to the Blue-eyed Nellie.

**THE COMBINATION.**—It is learned from one of the trustees of the Combination Mining Co. that the mill has now been running over a week, and that General Manager Akers reports a saving of about 90 per cent of the assay value of the ores. The mill is crushing about 25 tons per day. The mine itself is looking better than ever before.

**THE HECLA COMPANY.**—*Inter-Mountain*, June 12: The Hecla Consolidated Mining Co. at Glendale are now running their full plant of three water jacket furnaces, and are now turning out over a car of bullion every 24 hours. This is a large increase of production for them as they have not crowded their plant to its full capacity for nearly three years. In consequence a large number of men are employed at the works, and Glendale business men are all doing comparatively well.

**THE BUCKEYE MINE.**—The Buckeye mine at Philipsburg is attracting a good deal of attention lately. The principal owner of the property is John Kinney, who sometime since tapped the vein which showed itself to be of considerable value. He has interested Messrs. A. A. Pickens and Geo. Ross of this city, who have formed a syndicate to explore the property, which is now under active development. Considerable water has been encountered at 50 feet, but two shifts are now being steadily worked which will be able to handle the water until a pump arrives, which has been ordered. It is the intention of the syndicate to sink to 150 feet before crosscutting. A two compartment shaft is being sunk.

#### OREGON.

**A LARGE MILL.**—*Bedrock Democrat*, June 16: It is now settled beyond any question of doubt that the celebrated Cracker creek mines of Kowles & Bourne have been sold to a St. Louis syndicate for a consideration of \$1,000,000. The new company is expected to take charge of the property at once. It is authoritatively stated a mill costing \$100,000 will be erected on the mines at an early day. The sale of these mines will do more to boom the mines of Baker county than all of the other transfers that have ever taken place in this county before. It will be the means of attracting other capitalists here; in fact, it is already given out that important transfer of other valuable properties in the immediate neighborhood of Cracker creek are being negotiated and will take place within the next few weeks.

**CORNUCOPIA.**—George Clark returned yesterday from the Dolly Varden and Hazel White mines, owned by Capt. E. M. White and situated about 8 miles northwest of Sparta. He reports them showing up fine bodies of ore, especially the Dolly Varden, from which exceedingly rich gold ore is being extracted. Mr. Clark speaks of other mines of the vicinity as showing up splendidly. He says the mine owners of Cornucopia are more encouraged than ever. The Oregon Gold Mining Co. are putting to work all the miners that can be obtained, and it now looks like superintendent Smith would yet bring "order out of chaos." Mr. Clark recently

visited Sparta, and examined the Del Monte group of mines owned and being operated by Prof. J. Gny Lewis. He says the Prof. has one of the best mines in Oregon and thoroughly understands how to operate it. The ledge is from 7 to 9 feet in width and will yield from \$40 to \$100 to the ton on an average.

**WILL BOOM SURE.**—The sales of mining property in the Cracker creek district that have already taken place this spring, and the almost certain transfer of other mines in the near future, will, without doubt, give Baker county a genuine mining and business boom before the snow comes again. We are in a position to know that large capital will be invested in Baker county within the next 60 days. Few people realize that we are on the verge of the most prosperous era in the history of Eastern Oregon, but before many days the truth of the claim we now make, that Baker county and Baker City will have a boom, will be recognized.

**BAKER COUNTY.**—*Bedrock Democrat*, June 9: The advent of mining men during the past month from the markets of New York, Chicago, Philadelphia, Boston, St. Louis and San Francisco, their favorable reports to the parties whom they represent, the alacrity with which those parties are taking hold of the opportunities presented, all point to a literal fulfillment of that prophecy. Vast sums of money have been expended here within the past two weeks and small fortunes are now in transit to be exchanged for the greater ores now lying beneath the surface of the rock ribbed and ancient hills of Baker county. The section which at this time appears to be attracting most attention lies in what is known as the Cracker creek and Cable Cove district, distant between 20 and 30 miles from Baker City, rich in mineral resources, and extensive in territory. Within the past few days, in the first named district, several important transfers, involving thousands of dollars, have been made, and we are reliably informed by parties whom we know to be in a position from which they can speak advisedly, that negotiations far greater, financially, are now pending between owner and capitalist in each of these districts. As a result of the sales already made, even, the miner in Eastern Oregon is in a hopeful mood to-day. Said an experienced miner to the *Bedrock* reporter yesterday: "There are three properties (we omit the names) in the Cracker creek district that some day will make things hum loud enough to be heard outside of the State of Oregon." It is rumored that four mills will be planted before very long in these districts. Of this, however, we have no positive assurance. But we do know that already preparations are being made for the accommodation of 100 or more miners, who are to be supplied with the latest improved mining machinery for the prosecution of their work. These and other signs point to but one conclusion, and that is that development work is soon to be engaged in that will determine what possibilities are in store for the miners of Eastern Oregon.

#### UTAH.

**REVIEW.**—*St. Lake Tribune*, June 16: The week has been dull in local mining circles, and there is unquestionably a great depression among mining men, owing largely if not principally to the lavish shipments of Mexican lead ore across the border free of duty and the refusal of the Treasury department to reverse its rulings as to these ores, so as to make the regulations conform to the law. The low price of lead is held to be mainly due to this Mexican influx, and this combined with the fact that silver is now cheaper than it has been at any previous time during this century, fills miners' minds with discouragement. The cheering lining to the cloud is that copper keeps up in price, but for most here that doesn't count. The receipts in this city for the week were to the value of \$116,030.53, of which \$79,365.83 was bullion and \$36,664.70 was ore. For the previous week the receipts were \$85,199.05, of which \$46,668.33 was ore and \$38,530.72 was bullion. The Ontario product for the week was of bullion, 22,525.91 fine ounces; ore sales, \$22,607.31; total, approximately, \$45,133.30. The Horn Silver is understood not to be selling any ore on account of the low price of lead, which is probably a wise policy. Fine bar receipts in this city for the week were to the value of \$22,525; base bullion, \$31,300. The product of the Hanauer smelter for the week was \$8500 in bullion; of the Germania, \$11,640.83.

**PARK NOTES.**—*Record*, June 16: Never before was the mining industry in and around Park City in a more prosperous condition, considering the low price of silver and lead. Old properties are steadily increasing their production and enlarging their possibilities for the future, while new concerns are springing up every day, and partially developed claims are being made to yield up the wealth that is in them. More men are at work in new channels; new and rich discoveries are constantly made.

**THE GREAT ONTARIO.**—About all that can be said concerning the big Ontario, is that it continues and will continue to pay dividends at the rate of \$900,000 a year; that the mine and mill employ about 500 men; that its product for the past six months of '88 will be about \$900,000, fully as good as any like period before, and that this bonanza is but just reaching the first stages of its prolific production.

**THE DALY'S OPERATIONS.**—This fine young property, west of the Ontario, has established its worthiness to be styled the twin sister of the Ontario. Nearly 200 men are employed at the mine developing and prospecting the ledge, and about 100 tons daily are extracted and shipped. It pays dividends at the rate of \$450,000 a year, and soon the first million will have been reached.

**ORE AND BULLION SHIPMENTS.**—On Thursday the Ontario shipped 40 bars of bullion, containing 21,454 fine ounces of silver. During the week the Crescent shipped 156,000 pounds of concentrates and 94,870 pounds of first-class ore. Last Monday 9 bars of Daly bullion 928 fine silver ounces, were shipped from the Marsac mill, and to-day the product was 8 bars. For the week just ended the Mackintosh sampler received 236,080 pounds of Ontario ore; 83,720 of Daly and 175,070 of Sampson ore; total, 394,870 pounds.

**IN SNAKE CREEK DISTRICT.**—Another rich strike was made this week in the Southern Tier group. The Rochester is about ready to make a spurt to the front, the big "fault" in the hill having been gone through, and now developments are going on in the solid formation. The ore showing is encouraging, to say the least.

## MECHANICAL PROGRESS.

## The New Process of Welding.

We have already, some months since, made reference to a new process of welding by the use of compressed oxygen, but the great cost of oxygen made the process quite too expensive for ordinary work. The cheapening of oxygen by Brin's new process of its manufacture, however, has now brought that agent to so low a price as to be made very generally applicable to welding. We find the following reference by a correspondent of an exchange without signature, but by one who is evidently well posted in the matter:

The cheapening of oxygen by Brin's process of manufacture has put into the hands of metal-workers a new power. I have recently made a few experiments with the compressed oxygen and coal gas, and found that with a half-inch gas supply a joint could be brazed in a two inch wrought-iron pipe in about one minute, the heat being very short, the redness not extending over one inch on each side of the joint.

The appearance of the surface, after brazing, led me to experiment further with welding, a process which is not possible with ordinary coal gas and air, owing to the formation of magnetic oxide on the surfaces. Contrary to my expectation, a good weld was obtained on an iron wire  $\frac{1}{8}$ -inch diameter with a very small blowpipe, having an air jet about 1.32 inches diameter. This matter requires to be taken up and tried on a large scale for such work as welding boiler plates, which, it appears to me, can be done perfectly and with far less trouble than would be required to braze an ordinary joint. The great advantage of this would be that the boilers would require no handling, but could be welded with an ordinary large blow-pipe in position, and with about one-tenth the labor at present necessary.

The cost of the oxygen is trifling, and it is evident from the results obtained in brazing that the consumption of gas would be considerably less than one fourth that necessary with an air blast, irrespective of the fact that welding is possible with an oxygen blast, whereas it is not possible if air is used.

The surface of iron heated to welding heat by this means comes out singularly clean and free from scale, and a small bottle of compressed oxygen, with a blow-pipe and a moderate gas supply, would make the repairs of machinery, brewing coppers and other similarly apparatus a very simple matter. The trouble and difficulty of making good boiler crowns, which so frequently "come down," would be very small indeed when the workman has an unlimited source of heat at command under perfect and instant control.

## Nail Production in the United States.

The total production of cut nails in the United States in 1887 was 6,908,870 kegs of 100 pounds each, against 8,160,973 kegs in 1886, 6,696,915 kegs in 1885, and 7,581,379 kegs in 1884. The production of 1886 was the largest the country has ever attained. The decrease is mainly due to the increased competition of wire nails.

In 1886 the production of wire nails was about 600,000 kegs, made by 27 wire-nail works. In 1887 the production is estimated at 1,250,000 kegs, made by 47 works. The smaller sizes of wire nails are those which chiefly compete with cut nails. The displacement of iron nails by steel nails has progressed very rapidly. In 1884 the production of steel nails in the United States (including 500 kegs of combined iron and steel) was only 383,482 kegs, or 5 per cent of the total production of nails. In 1885 the production of steel and combined iron and steel nails was 1,823,127 kegs, or 27 per cent of the total production. In 1886 the production of steel nails alone was 2,968,989 kegs, or 36 per cent of the total production; and in 1887 the quantity of steel nails produced exceeded that of iron nails.

The manufacture of wire nails in America is a comparatively recent industry, but have, notwithstanding the persistent and determined fight against them by the manufacturers of cut nails, forced themselves into a recognized position in the nail trade, and gained steadily in favor, proving to be superior for many uses to the cut nail, until there are at present an aggregate of nearly 1800 machines in use in various parts of the country. At the start, most of the machines used were of foreign make, but Yankee ingenuity was not long in proving itself equal to the occasion, as it usually does, and there are now a large number of American-made machines, of more or less importance and value. The style of nail has also been a subject which has not been overlooked, and studies and experiments have been made in adopting their shape, construction of point, the chisel point being the latest and most approved style, especially for hard wood and thin stock, as they will not split like the square or round point. At the present price of nails, it is necessary to look well to the most approved machinery. With the introduction of wire nails, and their acknowledged superiority for many uses, there is a prospect that this is to become one of the leading industries of the country.

ECONOMY OF BISULPHIDE OF CARBON AS A MOTIVE AGENT.—Mr. Charles H. Haswell read

a paper at a late meeting of the Society of Civil Engineers in which he ascribed to the performance of bisulphide of carbon in an engine cylinder a very remarkable degree of economy. The relative theoretical value of the vapor of the carbon compound as compared with that of steam being given at 5.916 to 1. Test figures which he gave showed for the motor a coal consumption of 1.385 pounds per indicated horsepower per hour. The exhaust vapor from the engine cylinder was passed through a series of surface condensers until perfectly condensed. Mr. Haswell directed attention to the fact that an entire plant designed for the development of the practicability and economy of this type of engine was constructed a short time ago at Cleveland, Ohio, for the Brush Electric Light Company. The chief objection which has heretofore been urged against the use of bisulphide of carbon has been the leakage in consequence of imperfect joints and the great offensiveness of the fumes escaping. More perfect machinery may possibly remove such objection.

GREAT CHANCES FOR THREE INVENTORS.—I have often taken occasion to remark that the world is awaiting the appearance of three inventors, greater than any who have gone before, and to whom it will accord honors and emoluments far exceeding all ever yet received by any of their predecessors. The first is he who will show us how, by the combination of fuel, directly to produce the electric current; the second is the man who will teach us to reproduce the beautiful light of the glow-worm and the firefly, a light without heat, the production of which means the utilization of energy without that still more serious waste than the thermo-dynamic now met with in the attempt to produce light, while the third is the inventor who is to give us the first practically successful air ship. The first two of these problems are set for the electrical engineer, and we may be pardoned excess of faith should it prove to be such, when, contemplating the enormous gain to humanity which must come of such inventions, we look confidently for the genius who is to multiply the wealth of the world to an extent beside which even the boon conferred by the creators of the steam engine and the telegraph will not appear overshadowing. When this inventor comes forward, and most probably not till then, it is very likely that we shall see steam superseded by a rival.—Prof. R. H. Thurston in Forum.

POLYGONAL DRIVING WHEELS NOT A SUCCESS.—It is understood that the Swinerton locomotive has not proved particularly successful, and that it has been withdrawn from active service in order that alterations may be made. The peculiar feature of the engine, as described by us recently, was the form of the driving-wheel tires, which were polygonal rather than truly circular. No less than 210 flats were milled across the tread of each driving tire. Another inventor has gone still further in this direction, and a recent issue of the *Patent Office Official Gazette* contains a patent for making shallow recesses or cavities instead of flat surfaces in the treads of tires.

SASH WEIGHTS FROM TIN SCRAP.—Building, in referring to the manufacture of sash weights from scrap tinued iron, old cans, etc., after noting the difficulty in melting such scrap safely, concludes: "The sash weights produced (from scrap) are of a superior quality." To the above a cotemporary says that there is an opinion that the quality of sash weights is measured—outside of their form and the convenience for attaching the cord—by their avoidance. Just what the tin scrap of which they are made has to do with this is something that Building should explain.

INFLUENCE OF SURROUNDINGS ON THE QUALITY OF WORK.—It is claimed to be a fact, as well settled as need be, that the highest skilled mechanics are found in those places that offer the best inducements for living pleasantly. A wise man, looking for good machinery, will seek it in a pleasant town or city, because he knows that good mechanics are there to make it. A good mechanic will seldom locate in a place subjected to unpleasant surroundings either in prospect, climate or any other circumstance.

STREET-CAR MOTORS.—A few years ago there was considerable stir in the direction of steam street-car motors but the (then) coming electric motor put them in the shade. Now it looks as if the steam car was to have its day again. As a matter of fact, the steam car has never had a fair trial, and there are many who think it is yet to be the popular surface motor.—*American Mechanic*.

THE STOVE BUSINESS.—There are 315 stove manufacturers in this country, and their expenditures in the single item of patterns amounts to \$1,317,500 per annum. More stoves are probably turned out in the United States than in all the world besides. American stoves are to be found all over Europe.

TURPENTINE and black varnish, put with any good stove polish, is the blacking used by hardware dealers for polishing heating stoves. If properly put on, it will last throughout the season.

STEEL when hardened decreases in specific gravity, contracts in length and increases in diameter.

## SCIENTIFIC PROGRESS.

## Influence of the Magnetic Field on Crystallization, etc.

We have already called attention in these columns to the singular influence of the magnetic field upon the process of crystallization, and of its remarkable modification of wire, as shown in the Fraser treatment.

Mr. E. L. Nichols, in the journal of the Chemical Society, describes a set of experiments with aqua regia, nitric acid, hydrochloric acid and sulphuric acid, to illustrate the phenomenon that when finely divided iron is placed in a magnetic field of considerable intensity and exposed to the action of the acid, the chemical reaction differs in several respects from that which occurs under ordinary circumstances. With aqua regia, it was found that the speed of reaction is greater in the magnetic field than without, and that the heat of chemical union is much greater. The production of nitrous fumes under the influence of the magnet, and the yellow color of the resulting solution, show that the reaction was modified in chemical character. With nitric acid, the effect of the magnet was to greatly increase the speed, reducing the average time from eight minutes to less than one minute. Red fumes always resulted from the action within the field. With hydrochloric acid, the rise of temperature was much smaller than in the experiments with aqua regia and nitric acid; the speed of reaction within the magnetic field differed very little from that occurring under ordinary circumstances; and the character of the reaction in the two cases was almost identical. The rise of temperature under the influence of the magnet, however, was found to be slightly in excess of that produced when the magnet was not in action. With sulphuric acid the reaction was uniform and complete, and apparently of the same chemical character within and without the fluid. The magnet was found, however, to increase the speed of reaction, and to decrease the amount of heat produced. A series of measurements was made with nitric acid, in which powdered copper was substituted for iron. The reaction in the field was found to be identical with that which occurred when the magnet was not in action. The results arrived at by the author are shown in a series of curves, the ordinates denoting temperature in degrees of centigrade, and the abscissae time in minutes. The experiments are preliminary to a more complete investigation of the novel series of effects developed.

The *Electrical World*, in noticing the above series of experiments, remarks that they demonstrate the fact that chemical action is intensified whenever substances are placed in a magnetic field, and that such effects show that electro-chemistry presents a vast field for research. In another reference to the experiments described by Mr. Nichols, the same journal further remarks that "The particular phenomenon cited was observed some time ago, and Prof. Ira Remsen of Johns Hopkins University has devoted particular attention to its study, but his results have not yet been made public. In the meantime, however, electro-chemistry is occupying more and more the attention of chemists. Roscoe and Schorlemmer, in their standard work, have begun to classify and discuss the reactions of the elements according to their position in the scale of electric potentials, and the step they have taken has proven a great help to the elucidation of the laws of chemical combination. Electro-chemical analysis, though employed to some extent even now, is destined to be of greater importance, so that the chemist of the future will also, of necessity, have to possess a knowledge of electricity. This case is the parallel of the one cited recently, in which Colonel Flad, the president of the Society of Civil Engineers, remarked in a recent address that the engineer of the future will have to be conversant with electricity as with hydraulics."

## Zinc Etching—New Process.

In the art of etching figures or designs in metallic plates it is the common practice to transfer them upon the metal from photographs or to draw them thereon with an ink capable of resisting the action of the acid employed in the etching process, which eats away the surrounding metal, leaving the design in high relief. In following this method, however, the edges of the figures become almost invariably rounded, thus not producing the desired effect in the prints produced. It is to obviate these difficulties that the present process has been invented, which claims to secure sharp edges or contours in plates either of zinc or other metals. The following is the complete description: A zinc plate having a smooth polished surface is taken, and upon it is drawn the required design with an ink composed of asphaltum, turpentine, and oil (enough to keep the composition in a liquid state), and a little lampblack to darken it. Or, if the object to be reproduced be an engraving, either stone, plate, wood or any other material, it is transferred by the usual mode—that is, by taking an impression from the engraving on "transfer paper," and thence to the zinc plate.

The transfer ink used is a compounding of ordinary lithographic-printing ink and asphaltum, in the proportion of about one-third of the latter to two-thirds of ink. The drawing or transfer having been completed, and before the

ink has become dry, it is covered with a coat of powdered resin or copal, the hack of the plate being also coated with asphaltum to render it acid proof. The plate is now ready for the bath, which consists in muriatic acid of about 1.2 specific gravity (or other suitable acid, either in their pure or diluted state, such as nitric acid, etc.), where it is allowed to remain about five seconds. It is then taken out, washed, dried, and when dry heated only enough to melt the powdered resin or copal, so as to form a crust, which will protect the edges of the drawing or transfer, which have been formed by the first exposure of the plate to the etching agent. The plate is next returned to the bath of muriatic acid, again allowed to remain about five seconds, and washed and dried once more. Those portions which are high enough to print are then covered with asphaltum, and another coat of powdered resin or copal is added, after which it is replaced in the bath and allowed to remain until sufficient depth is obtained on the exposed parts. These operations of covering the plate and returning to the acid may have to be repeated three or four times, according to the nature of the work. The plates used are, of course, restricted to such metals as are affected similarly to zinc. The process will doubtless prove a considerable advance upon present methods.—*Paper and Press*.

OUR TEARS.—Tears in redundancy may strikingly express emotion, but that is a mental side, which is but a small part of their function, as we shall see. The principal element in the composition of a tear is, as may be readily supposed, water. The other elements are salt, soda, phosphate of lime, phosphate of soda and mucus, each in small proportions. A dried tear seen through a microscope of good average power presents a peculiar appearance. The water, after evaporation, leaves behind it the saline ingredients which amalgamate and form themselves into lengthened cross lines and look like a number of minute fish bones. The tears are secreted in what are called the "lacrimal glands," situated over the eyeball and underneath the lid. The contents of these glands are carried along and under the inner surface of the eyelids by means of six or seven very fine channels, and are discharged a little above the cartilage supporting the lid. The discharge of tears from the lacrimal gland is not occasional and accidental, as is commonly supposed, but continuous. It goes on both day and night—though less abundantly at night—through the "condits," and spreads equally over the surface of the pupil, in virtue of the incessant movement of the lids. After serving its purpose the flow is carried away by two little drains situated in that corner of each eye nearest the nose—into which they run—and called the "lacrimal points." The usefulness of this quiet flow of tears to both men and beasts, is manifest. There is such an immense quantity of fine dust floating in the air and constantly getting in the eyes, that, but for it, they would soon become choked. Very little is requisite to keep the ball free, and when some obnoxious substance—smoke, an insect, or the like, that affects the nerves—does make its way in, an increased flow is poured out to sweep it away.—*Ex.*

THE COURSE OF MATERIAL PROGRESS.—A comprehensive review of the economic changes of the last quarter of a century, and a careful balancing of what seems to have been good and what seems to have been evil in respect to results, would seem to warrant the following conclusions: That the immense material progress that these changes have entailed has been for mankind in general, movement upward, and not downward; for the better and not for the worse; and that the epoch of time under consideration will hereafter rank in history as one that has had no parallel, but which corresponds in importance with the periods that successively followed the Crusades, the invention of gunpowder, the emancipation of thought through the Reformation, and the invention of the steam engine; when the whole plane of civilization and humanity rose to a higher level; each great movement being accompanied by social disturbances of great magnitude and serious import, but which experience proved were but temporary in their nature and infinitesimal in their influence for evil in comparison with the good that followed. And what the watchman standing on this higher eminence can now see is, that the time has come when the population of the world commands the means of a comfortable subsistence in a greater degree and with less effort than ever before; and what he may reasonably expect to see at no very remote period is, the dawn of a day when human poverty will mean more distinctly than ever physical disability, mental incapacity, or unpardonable viciousness or laziness.—*Manufacturer and Builder*.

TO DETECT DAMP WALLS.—A very good way to test if a wall is damp (as suggested by Nessler) is to pin a thin sheet of gelatine on it by one end. The thin sheets of French gelatine used for making jelly will answer. If the wall is damp the gelatine sheet becomes curved, its convex side being against the wall.

THE AUTOGRAPHOMETER is the name of a newly devised instrument designed to autographically record the plan of the ground over which it is dragged. It can be carried about on a light vehicle, and when in use indicates the topography and difference of level of all places over which it passes.

## GOOD HEALTH.

## A Scientific Method for the Cure of Stammering.

Noticing the announcement of Prof. J. Whitehorn the other day, a reporter of the *Los Angeles Times* had his curiosity aroused as to this method for the treatment and cure of stammering, paid a visit to the professor's rooms, and made an investigation of this very novel branch of physiological science.

The reporter was informed that the seat of the trouble is generally in the articulatory organs or in the breathing organs. If there is an insufficient control over the diaphragm or over the muscles of the jaws or lips, or all three, that causes stammering. Again, it may be trouble with the tongue or muscles of the throat—that causes stuttering and lisping.

The diaphragm is a membrane which stretches transversely across the body between the stomach and the lungs. The rising and falling of this diaphragm by muscular contraction and expansion acts like a bellows, drawing in air and expelling it from the lungs. The dilation and contraction of this diaphragm is automatic and involuntary. We breathe asleep as well as awake; we breathe without thinking about it or willing it. Sick or well, drunk or sober, that useful but little appreciated organ works faithfully along and keeps us alive. Well, the diaphragm, while the least liable to disarrangement of any organ of the body, is still subject to some little eccentricities. Sometimes it throws in a few extra, spasmodic contractions and expansions, and plays the most fantastic tricks with our breathing. We call that hicoughs. Sometimes it gets into the way of playing these pranks on us just when we are in the act of speaking. The lungs are filled or partially filled with air, which we must expel to create the vocal sounds. The diaphragm, instead of rising to its convex form with an even and steady motion, comes up with a series of jerks and twitches, or rises half way and stops a second or so, and goes down again. That checks the flow of air through the glottis, the organs of speech cease to vibrate, or they vibrate spasmodically—and we stammer.

A very common mistake with stammerers is that they begin to talk with their lungs only half filled. That only exaggerates the tendency to a spasmodic action of the diaphragm.

And how do you treat this very peculiar malady? asked the reporter.

Well, in the first place, I have to show a man how he can gain absolute control over his vocal organs. I generally begin by making him maintain absolute silence for a week or ten days—sometimes the period is extended to 18 or 20 days.

And that is about the toughest job of all, put in one of the professor's pupils who sat by, speaking with somewhat painful deliberation, but without a stammer.

Then my next effort is to teach a patient how to breathe.

Here the professor stood up and exemplified the exercises which he imposes on his pupils. Closing his lips, he inhaled air through his nostrils until it seemed as though he must have filled himself down to his boot tips. Then holding the breath he tapped himself lightly with his finger tips on every part of the chest. That was to force the air into the remotest parts of the lungs and expand all of the air cells. Physiologically considered, the process also depressed the diaphragm to its lowest possible point and held it there steadily. After maintaining this inflation until he began to grow a beautiful maroon in the face, the professor expelled his supercharge of breath with a rush. The month being wide open as in the position of gaping, it was noticeable that the soft palate drew up into the roof of the mouth, and the base of the tongue was depressed, allowing a free opening for the passage of air. Then, after the breathing organs had emptied themselves as thoroughly as possible in a natural way, he placed his hands upon his body about the base of the chest (over the region of the diaphragm) and squeezed himself like a woman tightening her corset, and there was a still further discharge of breath, half as great as the first. That of course involved a full dilation of the diaphragm in a steady and deliberate manner. Thus, without exercising the vocal organs at all, the lungs had been completely filled and emptied, and the diaphragm had been put through its paces in regular form, and shown exactly how it ought to act. The professor explained, as soon as he had recovered his breath, that every organ of the body, like the body itself, is a creature of habit. If you get it into the way of doing right, the most natural thing in the world for it is to do right. Even the diaphragm may be educated.

The next effort, continued Prof. Whitehorn, is to get the mind to properly control the organs of speech. There are, as nearly as I can diagnose it, five speech centers in the brain. These must be in supreme command of their respective functions. They must issue their orders systematically, quickly, correctly, and their orders must be obeyed.

At first we have to forego the point of quickness, and the speech centers must issue their orders deliberately and carefully. Here the parlor organ comes into play.

Then the professor took his seat at the organ and again exemplified his exercises. These consisted of striking a note, with which the voice was required to sound a note in accord. This

note is sounded deliberately and steadily to the full capacity of the pupil's chest. Then it is repeated and repeated, until the note from the throat is as steady and even as the note from the instrument. Then comes a word instead of a note, and that must be uttered in the same measured tone. Then two or three words follow with musical deliberation, and finally a whole sentence, after the manner of a Catholic chant. A variation of this musico-vocal exercise is to sing the words up and down the scale, always accompanying the instrument, and always exercising the greatest deliberation.

After the training at the organ comes reading and declaiming exercises, the treatment being exactly the same as for voice building and elocution. There are also calisthenic exercises to strengthen and develop the muscles of the throat and chest. In this course the lungs are expanded, and as a purely hygienic treatment it is good, toning up the system and increasing the vitality. One object of holding air in the lungs as long as possible is this: The longer the air remains the warmer it gets and the more it expands the lung cells. If a man would follow this treatment scientifically from youth up, he would never die of pulmonary consumption.

How long have you followed this profession of curing stammerers?

About eight years.

And what has been your measure of success?

I have cured every case that has been subjected to thorough treatment except one.

The professor here took a scrap-book from the table and showed numerous written testimonials, in which the writers acknowledge complete cures from the unfortunate habit. A notable instance was that of a man who had been cured after stammering 40 years.

**THEATER AIR.**—An interesting account has been given by Osomo J. Burton of the amount of carbonic acid and organic matter in the Theater Royal and the Royal Lyceum theater in Edinburgh. At the time of the experiments the theaters were by no means full, nevertheless the temperature was from 10 to 15 degrees above that record immediately before the houses were opened, while carbonic acid was multiplied from three to five times. Mr. Burton remarks that the vitiation of the air proceeds with extraordinary rapidity at first, but the rate of change soon decreases till toward the end of the performance the air becomes little or no worse, and, indeed, in a few instances, it appeared to slightly improve. The air of the gallery was worse than that of any other part of the house; the amphitheater, dress circle and pit did not come in the same order as to degree of impurity in the experiments, but the pit was always worse than the dress circle. Headache and vertigo are produced when the amount of carbonic acid in the air of respiration is not more than from 15 to 30 volumes per 10,000. The facts as to all theaters ought to be known, for the public had much better lose an evening's enjoyment than submit to the enforced inhalation of a polluted atmosphere for a number of hours. —*London Lancet.*

**THE BANANA AS FOOD.**—According to one authority, one pound of bananas contains more nutriment than three pounds of meal or as many pounds of potatoes, while as food it is in every sense superior to the wheat bread. Although it grows spontaneously throughout the tropics, when cultivated its yield is prodigious, for an acre of ground planted with bananas will return as much food material as 33 acres of wheat, or over 100 acres of potatoes. It is not generally understood that bananas—fried, baked or roasted—are very appetizing, and that, sliced and placed in a dish with alternate slices of orange, they make a most delicious desert. In the West Indies, where they are grown in profusion, as elsewhere, they are much esteemed as food, and being easily obtained nearly all the year round, they are justly looked upon as being a great dainty by the natives.

**THE USES OF THE EUCALYPTUS TREE.**—The uses to which the products of the eucalyptus tree are put are annually becoming more varied and valuable. A very good cement is now made from the gum of the trees and is being introduced in the local market. From the leaves and tender branches there is compressed a substance used largely by engineers in steam boilers for the prevention of scale. Then, too, the nuts or acorns are, by powerful pressure, made to give forth an oil of which many medicinal preparations are made, chiefly liniment, ointment and lotions. A local manufacturer of rustic furniture for arboreal, summer houses and ornamental grounds says he finds the limbs of the old trees and the trunks of the young ones especially adapted to the purposes of his trade.

**NOT AN INFALLIBLE TEST.**—A "test for sewer gas" has been going the rounds of the papers which deserves notice on account of its misleading character. It consists in exposing to the suspected atmosphere pieces of paper moistened with a solution of sugar of lead, which are supposed to indicate the presence of the dreaded gas by turning black. This test is entirely unreliable, and only indicates the presence of sulphuretted hydrogen, a very disagreeable gas, but not especially dangerous in small quantities. There is no definite test for sewer gas known, and it is much better to avoid all possibility of its presence than to depend upon any chemical tests for indications of its existence.

## USEFUL INFORMATION.

## The Mesquit Bean Tree.

In Arizona and portions of Southeastern California, there grows a tree called the Mesquit bean tree, the timber of which is especially suited for that exceptionally dry, hot climate. When made into felloes for wheels it will not shrink, even if newly cut, as its sap is of an oily nature like lignum vitae. This wood is dark in color, hard and knotty, and rather rough to work. It is valuable, not only as wagon timber, but because it produces a large crop of beans which when ripe drop off and are harvested with a rake. The beans are about ten inches long and quite thin, and about half an inch wide. The seed or bean proper is very small, but the pod and pulp is very sweet and the Indians use them for food, grinding the pods up into flour. The Moqui Indians make this flour into tortillas and bake them on a flat stone from which their fire had been swept. The tree grows in the sandy deserts, but thrives best in the sinks of streams, or ancient riverbeds where, as it forms an obstacle to the drifting sands, great sand hills accumulate around the trunk, from the top of which the branches spread out luxuriantly. When wood is wanted by the teamster to rim his wheels, or by the settler for fuel, the trunk or larger branches have to be dug out, recalling the complaint of an Irishman in Arizona: "Begad it's a queer country where a man has to take a shovel wid him to git firewood and a hoe wid him to cut hay" (the gietta grass).

It is surprising that this wonder of the vegetable kingdom has not been systematically cultivated in Southern California. It will grow anywhere there with small care, and in addition to its value as a wagon hardwood, furnishes shade, fence, fuel and forage, for the beans are excellent food for sheep or hogs. What the Carahua tree is to Cyprus and the shores of the Eastern Mediterranean the now neglected mesquit may yet become to Arizona and semi-tropical California.

## Choosing Wall Paper.

In choosing wall paper great care should be exercised, as the color and general appearance of most of the patterns change very greatly under gas or lamplight. It is, therefore, desirable to select three or four patterns, put them up on the walls of the room and examine their general effects carefully by day and night before making a final choice, for not only do some patterns and colors materially alter by artificial light, but some, especially green and blue, absorb an immense amount of light, and are, therefore, not fitted for any rooms which are to be economically lighted. In papering the walls of a dining-room there are, of course, very many ways of treatment, and among the numerous good examples of paper-hanging now made, there should be no difficulty in selecting some really good patterns, artistic in design and coloring. As before stated, a dado or wainscot forms a desirable basis for a dining-room, a wide frieze a proper finish to the wall instead of carrying up the general tone of color of the wall to the ceiling or cornice; this suggests itself as infinitely more artistic than carrying up the same color or decoration to the top of the room, and thus making a sudden break without any gradation of color between it and the ceiling, excepting, of course, in cases where the ceiling is very low; then the treatment must be made without either wainscoting or frieze. When a plain color is desired as a background for pictures, the very cheapest and commonest paper often makes the most artistic and serviceable finish; the yellow-gray, gray-brown, and yellow brown common wrapping paper—the coarser the better—makes a very effective and cheap covering for a wall. This paper can be bought by the roll.

**CULTIVATE THE USE OF THE LEFT HAND.**—Many are the advantages missed by the non-cultivation of the left hand. Occasionally an artisan is seen who is equally able to handle tools with either hand. Such a one has constant advantages over his fellows, not only in the avoidance of fatigue, but in doing nice work and overcoming with ease difficulties that present themselves to those skilled with only one hand. The man who can use a hammer or knife or perform any other feat with the left hand at the same time that the right is busy will find frequent occasion to exercise his skill. Another and important reason for training the left hand to act with as great ease and precision as possible is that if injury occurs to the right hand the left can exercise readily all the functions possible to one hand, unaided. By training the left hand in you have one would be spared, in such a case, from spending much valuable time in educating muscles hardened by age and unaccustomed to obey the mandates of the will.

**THE PERFECT HORSE.**—I want a horse about 15.02 in height, and weighing about 1000 pounds, for ordinary use. The horse's head should be a spirited, cheerful, cerebral organization, for a horse has moral as well as physical qualities. His forehead should be broad, and his eyes cheerful. He should not have a bulging but a prominent eye. His face below the eye should be chiseled in a graceful and strong way. His nostrils should be wide. An awkward mouthed horse should be avoided, for such a horse betrays an awkward brain. An arched, well-

shaped neck and long throat should be required. Other requisites are a well-rounded shoulder; a short back, as long as you like underneath, as short as you can get it on top; a leg not too long nor too short; a short foreleg; the portion near the knee broad; a strong pastern, well proportioned; a healthy foot, the hoof being round and well proportioned; a hock free from swelling. —*Dr. H. B. Loring.*

**THE CIVILIZING POTATO.**—The potato has been a great civilizer. It commenced its work 300 years ago as a native American, and it has gone all over the world, doing its work in all lands quietly yet steadily, and in two ways—first, by being so cheap and abundant that everybody came to like it; next, by failing until everybody missed it and went to hunting all over the world for it. In 1880 this country produced about 170,000,000 bushels of potatoes. To day we are importing potatoes from Germany, Belgium, Scotland, England, Ireland. Our potato crop failed in a great degree last year because of drought in the West and long continuous rains in the East. Hence, we are importing potatoes and paying a duty of 15 cents per bushel on them besides freight. If there been a total failure of the potato crop we would have ransacked the world for them, for now we must have them however high they come. This shows how the potato has become a civilizer. We are short 20,000,000 of bushels, and must call on the world to make up that shortage. Generally, England is short on potatoes. Luckily this year she and all Europe have a surplus. Next year the situation may be reversed. Ireland ran out of potatoes in 1847, and commenced starving until we supplied her. Six years ago we had a great failure, and Ireland supplied us. But the year before that England and Ireland had to import potatoes. So the potato appears and disappears, to teach the world mutual dependence. The original potato still flourishes in an island off Chili, a gnarled and diminutive tribe, the ancestor of a long and prolific and beneficent line. —*Exchange.*

**THE HOUSE FLY** is a very thirsty animal, and it is said that it cannot go over 36 hours without water at hand; so one of the simplest of observances of the vigilant housewife is to keep no liquids around in anyway accessible to them. They are in this way easily kept away from rooms where food need not be, and the rooms do not have to be shrouded in Semi Egyptian darkness to keep them out, either. The early fly, like the early worm, is, after all, the easiest to catch, the hardships being all in the "up-and-at-it" part of the performance. They come in scant numbers, big and lazy here in March. One finds no trouble in catching them one by one with the fingers. By May they get lively and saucy—too numerous by far, unless kept down by an occasional dose of "huhach" or persistently trapped. Here is a recipe for a good fly exterminator: "Take half a teaspoonful of black pepper, one teaspoonful of brown sugar, and one teaspoonful of cream; mix them well together, and place them in a room on a plate where flies are troublesome, and they will soon disappear." —*Rural Californian.*

**COCOA AND CHOCOLATE.**—The cocoa or cacao tree is an evergreen, said to resemble a young cherry tree. The flowers grow in clusters; the pods are not unlike cucumbers in form, and of a yellowish red color. They contain from 20 to 30 nuts about the size of almonds, containing each two lobes of a brownish hue. After the seeds are freed from the pods they are dried, and then are either simply bruised or are crushed between rollers. Chocolate is also produced from the cacao tree. The seeds are gently roasted, shelled and reduced to a paste, when various spices are added. It is put into molds, and improves by keeping.

**SAND ON THE TRACK.**—Experiments have recently been made in England with a view of proving that a small jet of sand thrown by compressed air or steam directly under the tread of the driving wheels is better than a larger quantity thrown over the entire width of the rail. If the only end to be reached is one of adhesion in starting a train, the smaller quantity of sand will no doubt do, but in case of danger with a slippery rail the larger quantity is necessary. The experiments will doubtless result in improved methods in the treatment of rails to secure the adhesion of the driving-wheels. —*Practical Mechanic.*

**TO PRESERVE BUTTER WITHOUT ICE.**—Put your butter in a small bowl, set this in the deep saucer of a flower-pot, turn the flower-pot upside down over the bowl of butter; plug the hole in the pot with a cork; keep the saucer filled with fresh water, and the evaporation will preserve your butter without ice.

**INK FOR HAND STAMPS.**—To make an ink for hand stamps that will not injure the rubber, mix and dissolve two to four drams aniline color, 15 ounces alcohol and 15 ounces glycerine. The solution is poured on the cushion and rubbed in with a brush.

**A WOMAN'S INVENTION.**—Vanderbilt paid Miss May Tillinghast \$30,000 for inventing a new kind of tapestry hanging for his house.

**ELECTRICAL PATENTS.**—There were 1248 patents of an electrical nature issued in this country in 1887.

## Passing Events.

We devote a large amount of space this week to a description of the Lick Observatory, which, having been completed, will, in a few days, be formally delivered to the University of California by the trustees, who have built and equipped it. As it stands it is now the most complete astronomical observatory in the world.

The great mortgage suit against the Sutro Tunnel Co. has been compromised and settled. The suit was for \$1,600,000, but the settlement, it is understood, was for \$900,000.

The failure of Savage, Son & Co., the pioneer foundrymen of this city, is greatly to be de-

plored. All the existing contracts, are, however, to be completed. The failure was due to large expenditures incurred in extending this business.

The Cogswell Polytechnic College is almost completed, and it is now announced that it will be opened by Aug. 6th.

For the first time in California a building was illuminated with natural gas this week. The Crown Mills at Stockton obtained an abundance of natural gas from a 1000-foot well, which was sunk on the premises. The gas is also used as fuel under the furnaces.

## Gold-Bearing Deposits that Should be Worked.

We have in these columns often alluded to the widely varied character of the gold-bearing deposits found in California, some of these being primary and others secondary formations. Belonging to this first class are our auriferous quartz lodes, and to the second our placer deposits, resulting for the most part, from the disintegration and eluviation of the quartz lodes. These deposits are wide-spread and multifarious. They are found in all parts of our principal gold fields, occurring sometimes under conditions so strange that they excite alike our curiosity and wonder. Hardly anything in nature is calculated to awaken a deeper interest than the "Dead river" system of California. The mysterious history of these rivers appeals the more strongly to the imagination just because we do not know when or how they perished.

To the matter-of-fact man the gold these extinct rivers contain will, however, prove their greatest attraction. Where do they carry the most treasure and how can it best be reached is with the practical man the great question; nor is it one that can always be easily solved. The exploration of these Pliocene channels is generally an expensive and very often a difficult and hazardous work. In most cases long tunnels have to be run to open them, it being sometimes impossible to drive these adits on the proper level to reach that end. Occasionally when properly opened the channel fails to pay, or the pay stratum before being worked out dips below the tunnel level, cutting off the drainage. Working under ground and in the dark with hard rock and water, and many uncertainties to contend with, this branch of mining is beset with as many difficulties as almost any other.

There is in the province of placer mining another class of deposits that appear to have been singularly neglected. We refer to the tailings which in such great quantities have gathered in the gulches and river channels, the greater part of them coming originally from the hydraulic washings. The most of these deposits, it is true, contain comparatively little gold and are incapable of being handled to advantage, owing to lack of outlet. Such is the case wherever these tailings have lodged in the beds of the larger rivers or in the gulches and canyons that have but little fall. It is estimated that over 50,000,000 cubic yards of this material rest in the beds of Bear river and its tributaries, and even a larger quantity in the beds of the main Yuba. But nothing probably can ever be done with it owing to the causes above mentioned. For its bulk it contains but little gold, and there is nowhere fall to be had for moving it. There seems, in fact, to be but two large deposits of this kind in the State against which these objections do not lie; one of these rests in the basin of Slate creek, Sierra county, and the other in Shirt Tail canyon, Placer county.

While the deposit at neither of these localities is so large as that on the Bear or Yuba river, the material is rich and there exists at both places good facilities for moving it, this remark being especially applicable to the Shirt Tail canyon deposit. Precisely how much of this waste stuff there is in either of these localities we are not advised, though the quantity reaches many million cubic yards. It would really seem as if by this time something ought to have been done with these tailings. In a few instances where some of the smaller deposits have been washed over they have paid remarkably well. That these larger accumulations if worked would yield equally well admits of no doubt.

That something has been gained by deferring this work of rewashing is probable. The longer these tailings are left exposed to the action of the elements, the more they become disintegrated, or, as the miners term it,

"slacked." Portions of them consist of cemented gravel rich in gold, but which only years of this "sleeking" process can dissolve setting the precious metal free. A great deal more gold could therefore be gathered from them now than could have been done had a second washing taken place many years ago. Not only so, but the longer this material is left in these canyons the more it becomes concentrated, the lighter and more worthless stuff being carried away by the water while the gold is left behind. The bed of the stream becomes a great sluice, doing its work slowly but efficiently and without any aid from man. But these natural processes, so long in operation, having accomplished about all they are capable of doing, it is time the business of gold gathering were here accelerated by recourse to artificial means. If the owners of these properties have not the money to put them in shape for active production, they ought to have no trouble in getting enough to effect that end. We don't know where capital could look for a better investment.

## Our Special Edition.

We print this week a 32-page edition of the MINING AND SCIENTIFIC PRESS, devoted mainly to a description of the Lick Observatory. The description of the Observatory and its appliances will be found very complete. The details of construction of the great dome are here given from drawings. In fact this is the first detailed description of the Observatory as a whole which has been published. The numerous engravings will convey a better idea of the Observatory and its appliances than words. Some of these engravings we have had made direct from photographs to ensure accuracy. In scientific matters, especially, accurate representation is of importance to many. The photoplates printed in this edition are photo-facsimiles, made direct from negatives without redrawing. While not as clear in detail as a photographic print, they represent the instrument photographed exactly as it is.

We feel assured that our efforts to present a complete description of this California Observatory will be appreciated. Containing, as it does, the largest telescope in the world, and the most complete equipment of any similar institution, it has become famous before active practical work has been commenced. We have refrained from publishing this edition until the observatory was complete and ready to be turned over to the Regents. The informal transfer was made a few weeks since, and on the coming Wednesday the formal ceremonies of transfer will occur.

This edition of the PRESS will give to the reader not only a general idea of the importance of the observatory itself, but will give interesting details of the appliances and the operation of the instruments. It will serve for reference at all times, as dimensions, etc., are correctly given. The biographies of the gentlemen who are to do the work are published. Most of the observers are already on Mt. Hamilton preparing for active scientific work.

For a number of the engravings we are indebted to Prof. Holden, by whose permission the blocks were used. They were made for "Vol. 1, Publication of the Lick Observatory," a work issued by the Lick trustees, and which is not for sale. Much of the descriptive matter relating to the instruments and buildings has been compiled from the same source. Prof. Holden has furnished all the information asked for from him, and has done it in so pleasant and prompt a manner, that we feel indebted not only for his kindness but his courtesy as well. We have received assistance also from Mr. Keeler, Mr. Barnard and Mr. Hill of the Observatory staff, Mr. Fear of the Union Iron Works, and Mr. Burckhalter of the Chabot Observatory. Mr. Matthews, secretary of the Lick Trust, gave us permission to use any of the photographs made by him, and Mr. Taber, the photographer, furnished the prints desired. In fact all to whom we applied for assistance in getting up this edition very kindly complied with the request.

The expenses at the Con. Cal. and Virginia mine for May amounted to \$209,550.76, and included \$48,992.25 for salaries and wages, \$30,360.04 for mine supplies, \$94,780 for reduction of ore, \$10,192.84 for bullion tax, \$13,540 for Sutro tunnel royalties, and \$1311.75 for transportation and hauling.

## Investing in Fancy Shares.

The New York Financial and Mining Record in a recent issue asks through an editorial heading "Why not Invest in Sound and Conservative Mining Enterprises?" citing numerous examples of mining properties, arguing in favor of such investments. Among these is the Consolidated California and Virginia, selling at \$11, while it pays a monthly dividend of 50 cents per share—a yearly interest of more than 50 per cent—also the Eureka Consolidated and the Standard doing nearly as well.

If, while the shares of these companies are selling at prices that really ought to attract buyers, these sales are yet limited in amount, this finds explanation, perhaps, in the fact that these several companies have a bad habit of intermitting their dividends for long periods, sometimes substituting assessments in their place. It is this unhappy feature of the business that tends to discourage investments in this class of securities.

What the Record has to say in extenuation of mining share deals as compared with certain other speculative transactions is more to the purpose, such comparison inuring to the great advantage of the former. As our contemporary remarks, the most damaging of these mining deals had their origin in the exchanges established for promoting gambling operations in telegraph, railroad, petroleum and other speculative stocks, in some of which the movements have been so infamous that the worst of these mining proceedings become respectable beside them. The manner in which the members of these institutions plundered their clients was hardly better than open robbery. The business of cheating shareholders was reduced to a system, railroad wrecking being one of its well-recognized features. The money invested in railroads prior to 1879, amounting to the enormous sum of a thousand million dollars, was nearly all lost through foreclosure of mortgages on these properties, which were bid in by the syndicates formed for the purpose, and who had planned these proceedings throughout. According to the Record, more than 14,000 miles of railroads, with all their rolling stock and appurtenances, were in this manner passed from the ownership of the shareholders to that of these robber leagues, the whole business having been accomplished during the few years preceding 1879. Aggregate all the losses that meantime came through mining investments and they shrivel into absolute nothingness compared with those resulting from these monster frauds.

Nor did this era of railroad wrecking end with the year last mentioned. In the year 1881 as many as 29 railroads, covering a linear extent of 2617 miles, with a total capital stock of \$51,277,661, and a bonded debt of \$76,644,936, were sold out under like foreclosure proceedings, with a loss of all the stock and part of the money covered by the bonds and floating debt. Since 1881 financial disasters from this same cause, though somewhat diminished in extent, have been steadily going on; and yet, despite these losses, money is easily obtainable for building railroads, nearly 10,000 miles of new road having been constructed last year. Millions upon millions have been lost through speculation in telegraph and petroleum shares, but notwithstanding this the wires continue to be put up and the oil wells continue to be put down, the same apparently as if every dollar ventured in these stocks had returned a profit.

So has it been and so will it continue to be with mining, for the reason that the business as a whole has been profitable, and because it is being steadily purged of the abuses that have heretofore tended to bring it into disrepute. As in this, so with our other leading interests and industries, there is reason to believe the gambling spirit is beginning to subside, and that less money will hereafter be lost in stock speculations than has happened during the past 20 years. There is, evidently, a growing tendency on the part of all classes to invest their means in land, or solid manufacturing pursuits, rather than in stocks of any kind. This is a healthful sign, and should this disposition to gamble meet with general abandonment, the ill-gotten gains of the speculators will be greatly diminished while the common prosperity will be advanced in a corresponding degree.

The Northern Pacific train was robbed near Billings, M. T., on Sunday last.

ing vertically through holes in the ceiling and floor work the lavers by which the shutters are opened. All the mechanism is within the building, between the roof and ceiling, and consequently protected from the weather. These shutters are perfectly weather-tight, stand at all points of partial opening, and were invented by Mr. Thomas Fraser. A round aperture in the wall below the south shutter allows the meridian mark on a pier 80 feet to the south to be viewed with the meridian circle telescope.

#### The Transit House.

The transit house adjoins the meridian circle house, into which it opens through the vestibule in the base of the ventilating tower, by a door in the east wall. It is built of iron, with a wooden lining, after the manner of the meridian circle house, but the air spaces are smaller, and no means of access to them are provided. The transit occupies the center of the inner room, which measures 18 feet in an east and

partitioned off from the east end of the building and communicating by another door with the laboratory. The south end of the hallway contains a small stove.

The laboratory is 13x12 feet. It is lighted by two windows, one of which is of red glass, in the west end. Both are provided with shutters. Immediately below the windows is an iron sink with water supply. On the north is the brick pier which supports the plate-holder of the photoheliograph. The sides of the laboratory not otherwise occupied are fitted with shelves for receiving chemical reagents and photographic materials.

#### The Dwelling-Houses.

The astronomer's dwelling consists of a brick building 63x60 feet and three stories high, situated on a level piece of ground, excavated for the purpose, to the eastward of the observatory and about 22 feet below the summit. A long flight of steps leads up from the lower plateau

tendent. One large cottage and two smaller ones are but a short distance off, with sheds for poultry, etc. A little further away on the road to the reservoir is a large barn, with stables, and west of this a long, low house which has been used by workmen. These buildings are either painted white or whitewashed.

On the observatory plateau, east of the main building, wooden shops have been temporarily erected for the convenience of the builders. The largest is 28 feet square, and is used as a carpenter shop. It also contains a lathe, drilling machine, pipe-outter, etc.

Adjoining is a small shed used as a paint-shop. A blacksmith shop, with forge and necessary tools, is situated farther to the southward, close to the great dome. These buildings will shortly be torn down and a substantial brick structure will be built on the plateau.

#### Description of the Water Supply.

The principal source of water is a spring, sit-

on Huyghens' peak is filled from the main one on Kepler by means of the 1½-inch pipe above mentioned. In addition to these reservoirs, four wooden tanks, two of 5000 gallons each, one of 2000 gallons, and one of 1000, collect the rain-water from the roof of the meridian circle house. The valves for controlling the supply from the large reservoirs are in a small brick house near the double cottage on the saddle of the mountain.

During the summer of 1886 a third reservoir, to contain about 30,000 gallons, was built on Mt. Copernicus, 170 feet above the observatory floor and 4000 feet distant. This can be filled either directly by the steam pump at the springs, or by a wind-mill pump erected on the Huyghens' peak reservoir. The water from this source will serve to turn the large dome and to elevate its lifting floor, as well as to run the laths and other tools on the summit. It is also an important safeguard against fire.

During the summer of 1887 a reservoir hold-

THE GREAT LICK TELESCOPE IN ITS POSITION ON THE PIER UNDER THE DOME.

west and 14 feet in a north and south direction. The roof is arched, and the central opening is covered with a curved shutter, which is controlled by levers inside. Sliding shutters on the north and south allow the instrument to point to the northern horizon and to the object-glass of the photoheliograph, which serves as a collimating lens. The roof of the photoheliograph house obstructs the view to the south at a zenith distance of 85°.

Besides the transit instrument, the building contains the sidereal clock Hohwa No. 35, mounted on a sandstone pier directly west of the transit, the Fauth chronograph No. 3, and tables or desks, provided with drawers and hook shelves for the convenience of the observer. The entrance to the transit house from the outside is directly in front of and only 18 feet distant from the door opening into the north hall of the main building. This entrance is protected by a small vestibule.

#### Photographic Laboratory.

This is in a small wooden house with brick foundation, 16 feet in an east and west and 12 feet in north and south dimensions, situated 60 feet south of the transit house.

The tube of the photoheliograph telescope enters the building 2½ feet to the east of the center. A door in the north side opens into a vestibule, and this into a hallway 3 feet wide,

no which the workmen's cottages are situated to the principal entrance, and a large archway in the center of the eastern side of the building communicates with a wide hall extending completely through to the western side and dividing the lower story into two similar parts. The second and third stories are also divided by partitions directly over the lower hall, so that the building contains two distinct and precisely similar dwellings, which, however, may be made to communicate when desirable, by doors in the partitions. The floors of the third story and the summit plateau are on the same level, and are connected by a bridge, which gives easy access to the observatory. Two roads, one on the north and the other on the south, lead up to the observatory from the second floor, on the west side of the house.

In each dwelling there are 16 rooms, two of which are bathrooms. They are substantially finished with hard white walls and polished woods.

#### Shops, Barne and Quarters for Workmen.

The quarters for workmen are situated on the saddle of the mountain connecting the observatory and other peaks, where a level place was cleared for the purpose. At the foot of the flight of steps leading up to the astronomer's residence is a large double cottage containing 11 rooms, formerly occupied by the superin-

uated on the northern slope of Mt. Copernicus, about three-fourths of a mile from the observatory. Five large wooden tanks, each holding 2000 gallons, collect the water, which is then forced by a steam pump through a 2-inch pipe three-fourths mile long into the reservoir on Mt. Kepler, 338 feet above the spring. Steam is supplied to the pump from a 20 horse power boiler, for the transportation of which a road had to be cut from the observatory in the side of the mountain. The reservoir on Kepler is built of brick and cement, and has a capacity of 35,000 gallons. Pipes lead from it to supply the buildings of the workmen, the astronomers dwelling and the observatory. The head of water at the level of the plateau is 48 feet. A 1½ inch pipe also leads to a reservoir on Huyghens' peak, an elevation near the workmen's quarters. This reservoir is built in the same manner as the first, and has a capacity of 65,000 gallons. It is below the level of the buildings on the summit, and in winter and spring is kept full of rain-water collected by their slate roofs. For this purpose a 2-inch pipe was laid deep in the ground before blasting was begun on the mountain. As the carrying capacity of this pipe is not sufficient during very heavy rains, a reservoir 10x6x4 feet, in which the surplus water can accumulate, is provided under the main building. In the summer or dry season the reservoir

ing about 27,000 gallons was built at the springs, so that the permanent storage capacity at Mt. Hamilton is 200,000 gallons.

#### The Great Lick Telescope.

[Written for the Press by E. E. BARNARD]

Majestic on its grand old mountain stands the great refractor of the Lick Observatory—an enduring and noble monument for all time to the man whose patient industry accumulated the means for its erection and whose honest peaceably beneath its mighty and vigilant eye.

This magnificent instrument, complete at last in all its details, not only stands a monument to the man whose money called it into being, but it will remain a still greater monument to the genius of the men whose brains and energy called forth from the sand and the mines the subtle materials and formed them into this noble telescope.

It is quite needless to explain how even the rough casting of the glass from which its lenses are made met with a score of failures, each failure meaning months of delay. Nor how these glasses finally made the hazardous journey across the ocean; nor how the great optician who fashioned their meaningless forms into the wonderful lens, lived but to see his work just

finished, crowning thus grandly the end of a remarkable life. Nor need we mention the endless difficulties that were overcome in the mechanical construction of its mounting, so that when the great glass was finished it could be used successfully; nor the danger it ran in being transported across the continent and finally carried up a steep mountain over 4000 feet high. These are subjects that have been well gone over by others, and a mere description of the telescope and its purposes is all that is needed here.

The Lick is the largest refractor ever constructed, and is the most powerful telescope in existence. It is not the largest; the great reflector of Lord Rosse at Parsonstown in Ire-

land is the greatest telescope yet constructed, but in that style of instrument the rays of light, instead of being transmitted through a refracting medium, are reflected from a concave or rather a parabolic surface made of metal and which absorbs a great percentage of the light. They are much inferior to the refractory form of telescope and have now gone out of use almost entirely. [This last remark does not include the silver on glass reflecting telescopes, some of which are doing valuable work and are not much inferior to refractors for certain purposes.]

middle where it is 4 feet in diameter to the ends which are 38 inches in diameter. The weight of this tube with all of its attachments is 8600 pounds.

The center of motion of the tube about the head of the pier is 37 feet above the base, and when observing in the zenith the object glass is 65 feet above the same point.

The object-glass forms a small image of an object at its principal focus—at the eye end of tube—this image by the aid of small microscopes, or eye-pieces, as they are called, can be magnified at will, only limited by the brightness of the object and the steadiness and purity of the atmosphere. The eye-pieces of this great instrument magnify from 180 to 4000 diameters,

east in one sidereal day, the telescope is made to move in the contrary direction and at the same rate, so that when once pointed on a star it will follow it ceaselessly for any length of time, from rising toward setting. This great telescope, besides being the most powerful in existence, consists of really three distinct instruments. The visual telescope for observing and measuring the celestial bodies, a gigantic spectroscope for analyzing their light, and an immense photographic camera for accurately picturing and recording forever their physical appearance. In a few minutes the telescope is converted into a photographic one, by placing in front of the visual objective a correcting lens 33 inches in diameter, which shortens the focus

Though an assistant is required upon the gallery, near the center of motion, when the telescope is to be moved to distant points of the sky, an observer at the eye-end can control all the motions of the instrument when observing any special object without leaving his seat and without assistance.

#### Micrometers.

A beautiful filar-micrometer has been made for the large equatorial by Fanth & Co. of Washington. The design for this micrometer, after having been drawn by the makers, was revised by Mr. Burnham. The completed instrument is very convenient in every respect.

SECTIONAL ELEVATION OF 75-FOOT DOME.—(The Elevating Floor is Shown at Its Highest Position.)

but the actual working power will be much less than the mean of these two numbers.

Three finders (small telescopes that take in a considerable portion of the sky, which are used for bringing an object into the field of the great telescope), one of which is shown in the cut, are placed on the side of the telescope near the eye end. The largest of these has an object glass six inches in diameter—an instrument that a few years ago was considered a large and certainly a powerful one; and arrangement is also made for attaching the object glass of the 12-inch equatorial to the big telescope for a finder in photographic work, should it be required as a pointing telescope. In the upper part of the pier an opening shows the clock-room in which is the double conical pendulum driving clock, which gives the telescope a slow but uniform motion about the polar axis (which is set perfectly parallel to the axis of the earth) at the rate of one complete revolution in 24 hours of sidereal time. As the earth rotates once upon its axis from west to

some 10 feet and brings the rays from that part of the spectrum beyond the violet, which are strong in actinic power, to a sharp focus forming an image, which, though invisible to the eye, is rich in photographic power.

With this it is intended to photograph the moon, the planets, the nebulae, comets and stars. Measurements of the photographs of the stars will give in many cases the means of determining their distances. As the photographic plate is more sensitive than the human eye, it is expected that many discoveries will be made by thus photographing the heavens that the eye alone could never reach.

With the visual objective and the large spectroscope (which was made by Brashear from designs by Mr. J. E. Keeler) the light from the celestial bodies can be analyzed and their chemical composition made known. With this instrument the motions of the celestial bodies will be studied and their velocities toward or from us will be determined by the displacement of certain lines in their spectra,

The makers say that after many trials they made a screw which is perfectly satisfactory to them. After it has been investigated at the observatory, it may be of interest to our readers to describe it further.

It is used to measure the distance apart of two stars *A* and *B* by placing a fixed spider-line over *A* and moving another spider-line by the screw until this last line bisects the star *B*.

The distance apart of double stars, of satellites from their planets, etc., may be so measured. The angles of the lines *A-B* with the meridian

can be measured on the position circle attached to the instrument.

A duplex micrometer, so called, has been provided by Sir Howard Grubb of Dublin. The idea of this instrument was published by Alvan Clark, Sr., long ago, but only one was made by him. In its improved form it ought to be a most useful instrument. It consists essentially

PLAN AND ELEVATION OF SHUTTERS FOR 75-FOOT DOME.

and the star is placed on the intersection of two of the lines ruled on the glass plate, thus:

The other star, *B*, is now placed under one of the eye-pieces movable in the straight grooves, and the distance of *B* from the nearest line ruled on the glass is measured by a spider line attached to a micrometer screw in the usual way. The advantages of this form of micrometer are two. In the first place, long distances can be measured, since the eye-pieces over *A* and *B* may be much further apart than the field of a single eye-piece; and, second, the screw of the micrometer is used only to measure small arcs. The largest part of the distance of *A* and *B* is determined by counting the number of squares of the reticle included between them.

### The Spectroscope.

The spectroscope was constructed by Mr. J. A. Brashear of Allegheny, from plans furnished by Mr. Keeler, and is of very admirable workmanship. In form it resembles the simple spectroscope more closely than is usual with instruments of its kind. The frame carrying the collimator and pivots for the observing telescope is carried by two brass rods, six feet long and three inches in diameter, which project from the revolving jacket on the eye end of the great equatorial. This jacket is provided with position circles, clamp and slow motion screws, and the spectroscope rods can be rotated freely around the axis of the great telescope.

The collimating and observing telescopes are each  $20\frac{1}{2}$  inches focal length, and of 2.2 inches aperture. The range of the collimator slide is four inches, and the slide is provided with a millimeter scale which shows the position of the slit with respect to the focus of the great object glass. The slit has a great variety of attachments, among which are a separate rack and pinion motion and clamp, a double-motion screw for adjustment of width, with micrometer head, a double slide with pinion for adjustment of length, a slide which can be worked from the eye end for the reflecting prism of the comparison attachment, and a diagonal eye-piece for viewing the slit from behind, and thus setting it with great exactness upon a star. There are also a number of cylindrical lenses in suitable mountings.

The observing telescope is provided with a 12-inch circle, divided on silver to 10 minutes and reading by two verniers to 10 seconds, filar micrometer with a variety of eye-pieces, electric illumination for circle and micrometer, with apparatus for varying the color of the illumination, rack and pinion, clamp and graduation scale for the eye-pieces.

A "reversion attachment" containing a half-prism, reversion prism, and delicate micrometer, can be inserted in front of the object glass of the observing telescope, for measuring the motions of stars in the line of sight.

There are various prisms of different powers by Steinheil (some of them refugured by Mr. Brashear) which can be readily interchanged. The prism table can be turned readily by hand or by a tangent screw, or clamped to a contrivance which keeps the prism automatically in the position for minimum deviation. A fine diffraction grating by Rowland can also be mounted upon this table.

In addition to the apparatus already described, the instrument is provided with a comparison apparatus for spectra of gases and metals, spectrum tubes, induction coils and other accessories. It is mounted, when not in use on the telescope, in a case which rolls on rubber casters, and can then be used for laboratory experiments without at all interfering with its adjustments for astronomical work.

### The Mounting for the 36-Inch Telescope.

This mounting was made by Warner & Swasey of Cleveland, who had previously made many mountings for instruments of smaller size. They had diligently studied the problem for several years before undertaking this work, and by consultation with practical observers had learned just what conveniences were requisite or desirable.

The mounting proper rests on an iron column 37 feet high, made in sections of suitable size for transportation. The base of the column is 10x17 feet, and the top is 8x4 feet. The whole column weighs 36,000 pounds. Above this is the head, which weighs 8000 pounds and supports the polar axis. Around this head is a balcony on which an assistant astronomer can be stationed. By a system of wheels, the assistant can adjust the instrument on any star desired, and can read the position of the telescope by microscopes, illuminated by electric light. The polar axis is of steel 12 inches in diameter and weighs 2500 pounds. The declination axis is of steel 10 inches in diameter and weighs 2300 pounds. The tube is also of steel, 56 feet long. It is 4 feet in diameter at the center and tapers to 38 inches at each end. The tube complete weighs 8600 pounds. The entire weight of the mounting is 65,000 pounds.

The eye end of the telescope is made from designs by Prof. Langley and Prof. Holden, and is fitted for use with micrometers, spectroscopes, photometers, photographic apparatus, etc. This is the first mounting in which the wants of an observer with a spectroscope, a micrometer or a photographic apparatus are

in a glass plate ruled off into squares and viewed by several eye-pieces. To measure the distance apart of two stars, *A* and *B*, the telescope is moved until the star *A* is under the central eye-piece. The telescope is kept always directed on this star by means of the driving clock,

fully provided for in a convenient manner. The mounting has been inspected by competent authorities and pronounced to be entirely satisfactory. Reports to the contrary seem to have

rest. As it was not certain what the size of the large objective would be, nothing of importance was done in regard to this structure until 1885. At this time it became tolerably certain that

the University of Wisconsin), and together these gentlemen made a complete project of the cylindrical drum and a complete computation of the strains on one of the main arches of a 75-

at the disposition of the Union Iron Works, by whom the dome was built. The cylindrical drum proposed by Professor Holden consisted of a series of brick arches buttressed so as to give

been inspired by envy and spread by ignorance.

The 75-Foot Dome.

The first sketch of a large dome was prepared by Profs. Newcomb and Holden in 1874. It provided for a cylindrical drum of brick arches on which the iron hemispherical cupola was to

the observatory would ultimately possess a 36-inch objective of about 60 feet focus, and that a dome of some 70 feet interior diameter would be required. Prof. Holden, then director of the Washburn Observatory, obtained the permission of the Lick Trustees to employ a very competent mechanical engineer (Prof. Ball of

foot dome. This computation was necessary to determine such dimensions of the main arches as would resist the enormous wind pressures due to the high winds at Mount Hamilton (70 to 80 miles per hour).

The plans and reports were submitted to the Lick Trustees in 1885, and were finally placed

the requisite strength. A few of the openings were used as windows. The rest were filled up by corrugated iron shutters on the inside and iron louvre-work on the outside. In this way the complete ventilation of the dome was insured. This is a most important and essential point. It is not too much to say that no

one of the large telescopes now mounted, excepting only the 26-inch of the Naval Observatory, is in a position to do its best work on account of the inefficient ventilation of its dome. The air inside and outside must be of precisely the same temperature, in order that

according to careful and elaborate drawings prepared by Mr. Dickie. This cupola was temporarily erected at the Union Iron Works in March, 1887, and completely finished at Mount Hamilton in October. The following account of the dome we owe to the kindness of Mr. H.

### Description of the 75-Foot Dome at Mt. Hamilton.

[Written for the Press by HUGO P. FREAR.]

The iron cupola is 75 feet 4 inches in outside diameter and 71 feet diameter on the inside. The inner circle of the dome is thus 224.05 feet. The dome rests on a circular brick wall which is finished with the diameter of the dome on the outside and stands 35 feet 2 inches above the exterior ground. The wall is 3 feet 2 inches thick at the base, being reduced on the inside to 2 feet 5 inches at the top.

The total height of the dome from the base to the zenith is 76 feet 10 inches. The brick wall is capped by a coping of 44 sandstone blocks 10 inches thick and 3 feet square. To each of these blocks a cast-iron sole plate is rigidly bolted. Each of these plates is 3 feet x 3 feet x 1 1/4 inches and has a facing on top 24 inches square, upon which the track of the dome rests. The faced surfaces are therefore 5.09 feet apart on the inner circle of the dome. This allows for expansion and contraction which, with the extremes of temperature on Mt. Hamilton, is about one-half inch in diameter, and three times as much in

means are provided for forcing oil between the two bearing surfaces of the sole plate and the base of the track. This is accomplished by a screw 6 inches long and three-fourths inch in diameter, which screws the oil into a central reservoir, from which a groove is led to each of the four corners of the surfaces. As power is applied to the screw, the oil is spread over the surfaces from all directions. A shoulder is cast on each sole plate on the inner edge to prevent the track from working away from its central position.

This is especially necessary as the dome expands and contracts more on the sunny side, and as this expansion has a positive tendency to move the dome bodily from its normal position.

The lower track upon which the live-ring rollers of the dome revolve is of cast iron and made in 22 segments, each a little more than 10 feet in length. The best idea can be obtained by referring to the cut (No. 22). There are two rails on this track which are a part of a conical surface, the apex of which lies in the vertical axis of the dome and in a plane with the top of the rollers. One of the main features of this track, which is peculiar to this design, is a well-ribbed flange carried up on the outside to a line passing through the center of the rollers and the apex of the cone of the track. At the upper edge of this flange two smaller flanges are carried all around, one inside and the other on the outside. These serve a double purpose. The inside flange resists any tendency of the rollers which form the live ring to slide outward or down the cone.

Such a thrust is received in a line with the center of the rollers. The outside flange guides the dome during its revolution by means of 22 horizontal rollers carried on brackets which extend down from the base of the cupola. Each of these rollers has a flange on its lower edge which slips under the guide flange and thus resists all lifting tendency. Every effort was made to have the conical track as accurate as possible. Upon the accuracy of this and of the live ring, the excellence of the dome depends in a great measure. It is a difficult problem to face up a cone 75 feet in diameter. To accomplish this an attachment was put on the 25-foot boring-mill or upright lathe of the Union Iron Works. This attachment consisted of a pedestal firmly bolted to a concrete bed and of a massive radius bar of cast iron 42 feet long, pivoted at one end on the pedestal and carried at the other end in a horizontal plane by the cross motion of the boring-mill. After the segments of the conical track were planed up on the ends to the correct angle, two of them were bolted together and placed on the table of the boring-mill concentric with the pivot pedestal at the correct radius. As the radius bar was carried back and forth a tool working on an incline set to the angle of the cone was fed along the track, thus forming a perfect conical surface.

The live ring consists of 21 conical rollers. Each roller consists of three wheels. The base plate of the cupola rolls on the center wheel of the three, and the other two rollers travel on the lower track described above.

The outside wheel is about 30 inches in diameter, and the inside wheel about 23 1/2 inches in diameter. The three wheels are of cast iron pressed on to a steel spindle 3 1/2 inches in diameter. The webs are cast so that those of the inner and outer wheels stand vertical to the lower track and so that the webs of the central wheel stand vertical to the upper track. Thus the strain is taken directly and there is no tendency for the wheels to warp. Thus they have been made much lighter than otherwise would have been necessary. Each set of rollers is surrounded by a light brass frame hung by means of anti-friction roller journals at the extremities of the spindles. Each journal has 13 hardened steel rollers three-fourths inch in diameter fitted very nicely, and thus nearly all sliding friction is avoided. At the ends of the brass frames opposite the main guide track horizontal rollers are carried on steel center points which are capable of adjustment in both vertical and horizontal planes. These rollers travel on the guide-track and resist any tendency to throw the conical rollers of the live ring out of their true position and serve to keep the axes always pointing toward the center of the dome. The rollers have a flange on the upper edge which slips over the top of the guide-track and prevents any rocking motion of the frames. The different frames are connected together, making the live ring continuous by 1 1/4 inches gas pipe screwed up against rubber washers whose elasticity allows slight expansion and contraction.

Though not absolutely necessary, it was desirable to have the top of the conical rollers in a horizontal plane, so that if the dome drifted slightly from its position it would not affect its working. Extreme care was taken in turning up the conical rollers themselves. The diameters were first calculated and the rollers roughed off to the size. Then a segment of the conical track was leveled up with respect to the surface, which rests on the sole plates, and a roller was placed on it in the correct position. With a micrometer the distance between the top of the roller and the bottom surface of the casing was then accurately calipered. The taper of the cone, of which the roller formed a part, was changed until the upper part of the rim was in a horizontal plane. After the lathe was properly set to turn up the correct taper, a very light cut was taken off all the rollers with the same tool, making them exactly alike.

The upper track or base-plate of the cupola, which travels on the center wheel of the conical rollers, is of cast iron, and also in 22 segments,

the telescope may do its best work. Even at Washington the performance of the object glass becomes better and better until after midnight—that is, until the whole objective and the inside and outside air have attained the same temperature. The plan submitted was not accepted by the trustees, who decided on a solid cylinder of brick with only a few small openings for windows. This drum was built in 42 working days under the energetic supervision of Mr. Fraser in the summer of 1886. The iron cupola was built by the Union Iron Works, ac-

P. Frear, Chief Draughtsman of the U. I. W., who made all of the drawings of the cupola, and most of those for the elevating floor. We have to thank Mr. Irving Scott and Mr. Dickie of the U. I. W. for permission to print this and to reproduce the accompanying cuts.

circumference of the dome. This feature removes the greater part of a strain from the walls, which otherwise might produce injury to them. The walls have, however, to resist the friction produced by the sliding of the superstructure on the sole plate due to expansion and contraction. To reduce this to a minimum

The surface of the track lies in a horizontal plane which makes a great circle of the cupola above. The segments were carefully planed up radially on the ends and bolted together with reamed bolts. The track was planed to a true surface. Each segment was cast with a vertically ribbed flange in the center on the outside, to carry the brackets which hold the guide rollers of the dome which are described above. These brackets were so constructed that the rollers could be adjusted to suit the guide track. A narrow flange was carried all the way around on the outside to connect the base plate with the skin of the dome. A similar flange was also carried all around on the inside for stiffness. At each of the joints a vertical flange was carried on one segment above the main casting to connect with the main frames of the dome.

The framing of the dome consists of two continuous main arches or slit girders parallel to each other and 10 feet between centers, symmetrical with the vertical axis of the dome, which are solid plate girders 26 inches deep with webs  $\frac{1}{2}$  inch thick, and double angles on the inner and outer edges  $2\frac{1}{2}$  inches  $\times$   $2\frac{1}{2}$  inches  $\times$   $\frac{1}{2}$  inch. The girders not being in a great circle of the dome necessitated beveling the angles, so that they would lie fair with the skin. These are rigidly riveted to the cast-iron base plate at the bottom and might well be termed the backbone of the dome. Nine radial frames or girders are equally spaced on each side of the slit, stepping on the base plate at the bottom, and putting on the slit girders at the top. These are also plate girders 26 inches deep and have double angles on the two edges  $1\frac{1}{2}$  inches  $\times$   $1\frac{1}{2}$  inches  $\times$  3-16 inch.

The webs are 3 16 inch steel plate lightened with large oval holes about 4 feet long and 19 inches wide. Ten intercostal girders are carried all around horizontally, spaced about 5 feet apart, the first one being 26 inches above the top of the conical rollers.

These are of the same depth as the main frames with single angles on the outside to connect with the skin, and double angles on the inside. The webs are lighted by oval holes. At the intersection with the main frames on the inside, gussets 12 inches square were riveted on for strength and also to add to the appearance of the interior. The intercostals not only hold the main frames in position and brace them against wind pressure, but also by their hoop tension greatly strengthen them to resist a vertical load.

This structure not only must sustain its own weight, but it must resist the great strains due to the high winds on Mt. Hamilton, which at times blow at the rate of 70 to 80 miles an hour. It was also designed so that it could be used for slipping the tube and mounting of the telescope, and raising any ordinary weights by blocks attached to the inner side of the main girders.

The dome is covered with galvanized steel plates carried around in horizontal strakes about 26 inches in width. The lower or shear strake is three-sixteenths inch plate well riveted to the outer flange of the base plate. The huts were carefully shifted with the joints of the castings.

The dome was laid down full size in the molding loft of the Union Iron Works. The slit girders were built to the line and riveted in segment as large as could be shipped conveniently. The stations where the radial girders butted at the top were lined and the holes punched. All the radial girders were projected in their true shape, built to the line and the holes at the ends punched to match the rest of the work. Each intercostal was expanded to its true shape on the floor, and the angles set and riveted on. These intercostals being normal to the skin, formed frustra of cones, and after being riveted were set to their proper shape.

Every segment of plating was expanded on the floor, cut to the size and the holes punched on two sides. They were then hammered to a spherical shape. In this way the whole of the framing of the dome was completed ready for erection, each piece ready to fit into its own place. The framing was erected at the Union Iron Works. Everything came together so nicely that it was considered unnecessary to try the plating, which was immediately shipped to Mt. Hamilton. A temporary Bishop derrick was erected in the center of the dome and used for lifting all weights, both at the Union Iron Works and at Mt. Hamilton.

It was considered important to make the dome rain and snow tight. To accomplish this an umbrella of No. 18 B. W. G. gal. steel plate was attached to the guide brackets before mentioned and carried down all the way round. The lower edge of this umbrella dipped into a cast-iron trough which can be filled with glycerine and water, or any non-freezing liquid. This sealing trough was connected to the brick wall, thus making the dome absolutely rain-tight at the bottom.

The slit is 9 feet 6 $\frac{3}{4}$  inches wide in the clear, and extends from the first intercostal at the bottom to 3 feet 6 inches beyond the zenith, giving ample space for observing from the horizon to the zenith. The shutters are constructed on the general plan described by Professor Holden in the *American Journal of Science*, November, 1873, with important improvements in the position of the pivots devised at the Union Iron Works, and with Mr. Fraser's rain-tight joint.

The slit is closed by two shutters which open like a pair of scissors and are pivoted 6 feet beyond the zenith and 20 inches each to the

opposite side of the vertical plane, symmetrically dividing the slit. This eccentric pivoting keeps the shutters closer to the dome and avoids expense and also exposure to violent winds. The track on which the lower end of the shutters travel is supported by the guide brackets and is made to radii struck from vertical lines passing through the pivots. These radii are considerably greater than the radius of the dome, being 45 feet 3 inches. The center of each portion of the shutter track was shifted to the opposite side of the center, as was said. Theoretically, these centers would lie in vertical planes perpendicular to tangents to the dome at points equally distant between the center and ends of the track. Practically, it was not easy to place the centers quite in these positions, as it required very long arms which crossed each other and consequently could not be made sufficiently deep for the strength required to support the load. The rollers at the bottom were turned up to a true cone and were fitted with anti-friction roller bearings. At the extreme bottom of the shutters, two pairs of horizontal guide rollers keep them on the track. The rollers have flanges which lip under the track to prevent the wind from lifting the shutters. The shutters are supported at the outer corners at the top by conical rollers that travel small tracks, whose centers are the pivots. The track girders are built up of steel plates and angles similar to the slit girders. They are placed both on the inside and outside with No. 18 B. W. G. gal. steel plate.

An air space of 18 inches is allowed between the two skins to prevent condensation of water and consequent dripping on the telescope. That part between the slit girders not occupied by the shutters is also plated on the inside for the same reason.

The telescope when in use is always in the plane of the slit girder. The shutters are operated by hand by means of a wire rope winding off two right and left hand drums coupled together and geared down by a train of wheels.

A combing six inches high is carried all around the slit. A rubber gasket is bolted to the edge of the shutter, which closes up against this combing to form a water-tight connection. The shutters also come together against a rubber gasket. Rain troughs are placed on the inside as a safeguard.

An iron ladder is carried up on the outside of each shutter. Similar ladders are also carried up at three other points of the dome 90° apart. These make the outside work easily accessible for inspection and painting. At the base of the dome a narrow gallery runs all around outside excepting at that portion occupied by the shutter tracks, and it is supported by the guide brackets. From this gallery the guide rollers can be inspected and platforms can be suspended, from which all the ironwork below can be painted.

A gutter is carried around at the base of the dome to collect the rain-water, which in the dry season has to be used very economically.

The power for turning the dome is transmitted by a water engine through an endless wire rope which passes around the base of the dome and over two sheaves, thence down around the driving sheave and thence up again around a tightening sheave which can be raised or lowered by means of a screw and hand wheel. The rope is five-eighths inch diameter well served with manila. The driving sheave, which is five feet in diameter, has two grooves with rubber seats. The rope takes a full turn and a half around this sheave, thus allowing sufficient friction for turning the dome without requiring an excessive friction on the rope, which would increase the tension in the journals and require more power. Then there is sufficient tension on the rope to take the weight of the driving sheave, there is ample grip for driving the dome. The tightening sheave is twisted sufficiently out of the plane of the driving sheave to allow the rope a fair lead from the two grooves.

The water engine is a three-cylinder single-acting trunk-water engine, designed to work under the head obtained at Mt. Hamilton, which is about 65 pounds to the square inch with the present hydraulic arrangements. The cylinders are 8 inches diameter by 6 inches stroke, and have each a single port and piston valves without lap or lead. All the working parts of the engine are inclosed in a neatly-shaped cast-iron box-frame, and made accessible by hand-holes. This is done to save the water, due to leakage, if there should be any, which now passes off through the drain pipe at the bottom. The engines are reversed by changing the feed to the discharge and vice versa. This is accomplished by two pipes leading from either side of the piston valves to an auxiliary *D* slide valve, which, as it is moved in either direction, distributes the water to or exhausts from either pipe. A differential hand gear, which is operated from the elevating floor, is attached to this valve. The valve spindle (which is vertical) is hinged to the center of a short lever, which is horizontal in its normal position. One end of this lever is screwed up or down by a hand-screw extending to the top of the elevating floor. The other end is screwed up or down by a screw geared directly to the main shaft of the engine. So long as the hand-screw is turned, the valve will be pushed open in one direction or the other. As the engine runs the other screw will be following up in the opposite direction with a tendency to close the valve.

When the hand-screw is stopped the engine runs until the valve gets on its center and then comes to rest. The dome revolves in either direction, according as the hand-wheel is turned

one way or the other. As time is valuable while making observations, it is desirable to move the dome in the direction of the shortest path. For this reason the screws are made sufficiently long to allow the dome to make 12 complete revolutions in either direction.

#### Elevating Floor (Sir Howard Grubb's Plan).

This floor or elevator is 61 feet 6 inches in diameter and has a travel of 16 feet 6 inches. It has a circular aperture 25 feet in diameter in the center surrounding the pedestal of the telescope. When at its lowest position it is on a level with the first gallery to which the main entrances of the dome lead. At its highest position it is flush with the second gallery. A stairway leads up from the first to the second gallery, from which the floor is accessible in all positions. The galleries and floor have movable band rails, which can be taken away when they interfere with the observing chair.

The floor consists of 20 radial girders built up of plate and angles similar to the main framing of the dome. At the outer end they are connected together by a continuous vertical plate 24 inches deep, and also by a horizontal continuous stringer plate 12 inches wide top and bottom. The inner ends are connected in the same way except that the vertical plate is 4 feet 4 $\frac{1}{2}$  inches deep. The radials are stiffened at the center by intercostals. The floor proper is laid with ash 2 inches by 2 inches in circular strakes. The floor is perfectly balanced by 8 cast-iron weights hung by a flat steel rope 2 $\frac{1}{2}$  inches wide and  $\frac{3}{8}$  inches thick, passing over sheaves carried by rectangular columns. These columns are built up of four-corner angles with lattice sides and the counter weights move up and down within them. A 2 $\frac{1}{2}$ -inch screw with 1-inch pitch containing 198 threads is carried up on four of these columns to the full height. It is by means of these screws that the floor is raised and lowered. Beneath the floor a line of shafting two inches diameter is carried around, connecting the four screws by miters, causing them to move together. This shafting is driven by a water engine of the same pattern as that used for turning the dome. It is operated by the same style of differential hand-gear from the top of the floor, so that both can be worked at the same time by one man.

#### Hydraulic Rams for Elevating the Floor.

The water engines previously described were found to be too slow in action (requiring 50 minutes or more to raise the floor 16 $\frac{1}{2}$  feet), and on this and other accounts it was decided by the president of the Lick Trustees to use them only as an auxiliary motive-power (available should the substitute for them break down temporarily) and to provide a new device which would be more rapid and which would use less water.

The new arrangement consists of four (4) telescopic hydraulic rams placed at equal distances around the outer rim of the floor. The rams are eight inches in diameter. They were made telescopic in form so as to reduce the depth of the holes in the rock beneath the dome which receive the cylinders.

To keep the floor level as it moves up and down, a 2 $\frac{1}{2}$  inch shaft is carried all around the floor, so arranged that four pinions keyed to this shaft engage in vertical racks fastened to four of the columns which support the gallery.

The rams are operated by the same differential valve which operates the engine. If the floor is down and the valve is opened, the floor commences to rise and at the same time automatically closes the valve. Similarly as the floor sinks it automatically closes the valve. This is designed to prevent any possible accident. An indicator is attached to the valve, which shows the observer how much the valve is opened, and it is so arranged that its indications can be read in the dark. In the preliminary trials these rams raised the floor 16 $\frac{1}{2}$  feet in less than 9 minutes and lowered it in less than 5 minutes.

#### The Astronomical Instruments.

The descriptions of the 36-inch and the 12-inch telescopes are given elsewhere. There is also a 6 $\frac{1}{2}$  inch equatorial telescope, the objective by Clark & Sons and the mounting by Warner & Swasey. In ordering the Repsold meridian circle it was stipulated that the three objectives of equal size, which belonged respectively to the circle and to the two collimators, should be made by Alvan Clark & Sons. The north collimator is to remain always in position. The south collimator will be used in connection with it for determination of the horizontal flexure by the method of opposite collimators, but can be replaced for determinations of collimation by the south *mirre* about 80 feet distant.

Its objective thus becomes available for other purposes, and Messrs. Warner and Swasey have provided a portable mounting for this objective, which is shown in the engraving. It is the work of a few moments to detach the col-

limator objective in its cell and to adapt it to the tube of the six-inch mounting. The east-iron column of this mounting is hollow and contains the driving clock and weights. It can be taken apart just below the clock for greater convenience in transportation, when the instrument is used on eclipse or other astronomical expeditions. The clamp and slow-motion screws in right ascension and declination are very conveniently arranged so as to be under the control of the observer at the eye end of the telescope. The polar axis is adjustable to any latitude down to 10 degrees.

#### The Micrometer of the 12-Inch Equatorial.

The illustration of the micrometer of the 12-inch equatorial is engraved from a photograph of the Lick Observatory micrometer, the construction of which will be understood from a brief description. The Council of the Royal Astronomical Society allowed the Lick Trustees to use the engraving in their "Publication." The cut shows Burnham's illuminating apparatus attached. Mr. Burnham's description is as follows:

"The micrometer is of the usual form made by the Clarks, *B* being the graduated head of the micrometer screw, and *A* another graduated head turning on the same axis for giving the whole revolution of the screws. *C* is the head of a pinion attached to the plate under the micrometer-box, and gearing into the teeth of the rigid circular plate containing the position circle, for moving the wires in position angle. *D* is the head of another small pinion for sliding the eye piece over the wires. *E E'* are heads of the bisecting-screw for moving the whole system of wires and the box *S* in a direction parallel to the micrometer-screw and at right angles to the wires.

"The light from the lamp *L* is reflected by a mirror in *N*, and passes down that tube and through *M*, and then through a hole in the end of the box to the wires. A condensing lens is placed in *N*, for the purpose of concentrating the light on the wires. On the opposite side of the wires, toward the micrometer head, a small reflector is placed, which reflects the light back, thereby symmetrically illuminating the wires on both sides. The lamp swings freely on its axis in the line of *OT*, but always maintains a vertical position, whatever may be the direction of the wires or the pointing of the telescope. The tube *N*, with the lamp and its attachments, has an axle *R*, supported by the fixed arm *K*. The bearings *T*, and the axle of the lamp, are kept always horizontal by the weight of the counterpoise *P*. The tube *M* is fixed to the micrometer-box and projects loosely over *N* far enough to allow for the necessary movement of the box by the bisecting-screw *B*. The supporting arm *K* is attached by the set-screw *J*, not to the box, but to the plate underneath it, so that the weight moved by the bisecting-screw is not increased at all by the illuminating apparatus. Attached to the same plate, on the opposite side by a set-screw *I*, is the rod *H*, bent so as to be thrown forward out of the way of *B* and *B'*, with a weight *F* to balance the weight of the lamp attachments. The whole device can be instantly detached when desired, by loosening the screws *I* and *J*.

"In the tube *M* is a slot *V*, in which is placed a slip of red or other colored glass, held in any desired place by a light spring pressing against it. All or any part of the light can be made to pass through the colored medium. The mirror in *N* is attached to a tube which slides into the tube *O*. By turning this tube by the milled edge projecting at *O*, the inclination of the mirror may be varied to any extent, and the light reduced from the maximum amount until the wires become just visible. By turning the mirror 90° or more, the light is entirely shut off. It will be seen that the lamp can revolve freely through the bent arm, *Q*, and the whole movable part of the device, lamp, arm *Q*, and counterpoise *P*, can turn through the supporting arm *K*, the lamp at all times remaining vertical and in exactly the same position with respect to the wires. It might at first be supposed that the lamp, or some of the parts, would be in the way of the observer. I have never found it so in practice, and, although it is but a few seconds' work to either attach or detach it, I have very rarely removed it, whatever might have been the use of the telescope at the time.

"It is important to preserve the relative positions of the micrometer head, bisecting screw and pinion *C*, as here shown. No other arrangement will be as convenient. In every possible position of the micrometer the necessary use of both hands at the same time will be found to be convenient and easy for the observer. Naturally the more delicate motions of the micrometer screw and the pinion will be effected by the right hand, and the corresponding movement of the bisecting screw by the left hand. When the micrometer-box is anywhere near a horizontal position with respect to the observer (the wires at right angles to the line joining the eyes), *C* and *E* are used by the right and left hand respectively in measuring angles, and *B* and *E* in measuring distances. When the box is more nearly vertical with respect to the observer, the head *B* of the bisecting screw will be worked by the left hand in each case. The convenience and practical value of this arrangement can only be appreciated by one who has used the old plans and then tried this one.

With respect to the practical working of the illumination, I will briefly say that it has proved a complete success in every respect,

Any object that can be seen under any circumstances, however faint, can be well and accurately measured. There is no such thing as a star too faint for measurement, if it can be seen at all. A very feeble light is sufficient to illuminate the wires perfectly for any object."

A complete set of eye-pieces of various powers has been obtained from Steinheil. These are furnished with adapters of various sizes, so that they can be used with any of the equatorials.

#### The Driving Clocks.

The driving clock for the 6½-inch telescope has several features of interest. The double conical pendulum is so hung that its period of revolution is very nearly independent of the height of the balls, which always assume the position proper to their velocity of rotation, although the retarding friction increases continuously as the balls diverge. The rate of the clock is controlled by simply turning the balls, whose center of gravity does not coincide with the geometric center about their axis, the position being indicated by a graduated arc on the face of the ball. The performance of this clock is very satisfactory. The same clock is used in the Warner & Swasey chronograph, with the addition of an effective control from a clock bending seconds. The design of the driving clock for the 36-inch equatorial is similar to this.

#### The Comet-Seeker and the Photoheliograph.

The four-inch comet-seeker (by Alvan Clark & Sons) has an aperture of four inches and a focal length of about 33 inches. The rays from the objective fall on a reflecting prism midway in the tube, and are bent into a horizontal plane. The observer has only to move his eye in azimuth while the telescope tube is moved in altitude, in order to cover the whole sky. The motion in altitude is effected by means of a crank. The instrument was ordered on the recommendation of Prof. Newcomb in 1880, and delivered in 1881. In the latter year it was used to observe the transit of Mercury.

The photoheliograph (by Clark & Sons) is mounted due south of the transit house; the transit instrument serves to determine the position of the axes of the photoheliograph; and conversely, the photoheliograph is used as a south collimator for the transit. The instrument is substantially of the same form as those employed in the United States transit of Venus expeditions of 1874 and 1882, which have been described (with plates) in the "American Observations of the Transit of Venus, 1874, Part I." The Lick photoheliograph has an objective five inches in diameter. Its focal length is al-

Messrs. Repsold, and thoroughly inspected by Professor Auwers and by Professor Krueger, who were kind enough to do this at the request of the Lick Trustees. A few very small changes were made at their suggestion. In a

meridian circle pattern were omitted. It was mounted in October, 1881, and has since served for time determinations.

In 1885 it was remodeled by the makers according to designs by Prof. Holden. The ob-

ment. Some minor details are omitted in the cut.

#### Declinograph.

In April, 1885, Dr. Johann Palisa, of the Observatory of Vienna, kindly undertook to have a declinograph made which would fit either the 12-inch or the 6-inch equatorial. This instrument was delivered in 1886.

It will not be necessary to give here any elaborate description of the apparatus. Its principle has been set forth in communications by Dr. Knorre of Berlin, and by Dr. Palisa in the *Astronomische Nachrichten*.

#### Universal Instrument by Repsold.

A universal instrument by Repsold was delivered in 1885. Its telescope tube is broken at the middle, where a reflecting prism sends the rays through the axis to the eye. Its aperture is 2.15 inches; the length of the axis between bearing surfaces of pivots to 11½ inches; the horizontal circle, 10 inches diameter, is divided to 4', and reads by two microscopes to 2". The vertical circle is 9½ inches in diameter, is divided to 4', and reads by two microscopes to 2".

This instrument, together with the six-inch equatorial and a chronometer, constitutes an outfit which can be packed in a few hours, and which is very suitable for astronomical expeditions. All these instruments pack readily into boxes of convenient size and shape.

#### The Clocks, Chronometers and Chronographs.

There are two clocks by Hohwn, each of essentially the same pattern. One is mounted in the transit-house on a sandstone monolith and the other is mounted in a closet in the clock-room.

The Dent clock is mounted on a closet in the meridian circle house. It has a double four-legged gravity escapement and mercurial compensated pendulum. The pivions have 18 leaves. The workmanship throughout is of very great excellence.

The Frodsham clock is intended for the dome of the 36-inch equatorial. It closes an electric circuit every odd second and also on the zero second of every minute. The pendulum carries a single large jar of mercury.

The Howard clock is regulated to mean-time. Its face shows "Pacific time," i. e., the local time of the meridian 120° west from Greenwich. ("Pacific time" is 6m 34s. 29 faster than Mt. Hamilton time). It is used as the standard mean time clock, and especially to send a time signal at 12 m. daily (except Sunday) to the larger cities, to railways in California, and to send signals every 2s during the day-time to various places in the city of San Jose.

THE 6 1-2 INCH EQUATORIAL.

letter of May 6, 1884, Professors Auwers and Krueger say that "we assure the Trustees that the meridian circle ordered of the Messrs. Repsold is in its construction in every way suited

jective (which is a very excellent one by Alvan Clark & Sons) received a new cell. The eye end was remodeled so that the micrometer can be revolved 90° in position angle between metal

MICROMETER FOR 12-INCH EQUATORIAL.

DRIVING CLOCK.

THE FAUTH TRANSIT.

most exactly 40 feet. The diameter of the mirror is a little greater than seven inches, and unlike the instruments of the Transit of Venus Commission, the mechanism supporting the mirror is compactly connected with the clock-work which drives it, all being mounted on a single pier. Prof. David P. Todd used this instrument at Mt. Hamilton in his observations of the transit of Venus in 1882.

#### The Six-Inch Repsold Meridian Circle.

This instrument was ordered by the Lick Trustees in 1882 and delivered in 1884, when it was mounted by Mr. Fraser and Professor Holden. Previous to its dispatch to America it was temporarily mounted at the obse of the

to be the chief instrument in an observatory of the first class."

#### Four-Inch Transit and Zenith Telescope Combined.

This instrument by Fauth & Co. was ordered on the recommendation of Prof. Newcomb in 1880, and delivered in 1881. The aperture is 4.1 inches. It is essentially of the same pattern as the meridian circle of the School of Science at Princeton, New Jersey, by the same makers. As originally ordered, it had two circles 16 inches in diameter, one divided coarsely on the edge and read by verniers to 1', the other provided with an undivided hand of silver. The microscope hearers, etc., of the

stops. In this way it can be used either in R. A. or in Z. D. The undivided circle was divided so as to read by opposite verniers to 10', and a sensitive level in Z. D. was provided, with a clamp and tangent screw attached. In this way the instrument becomes a zenith telescope also, and can be used for an independent determination of the latitude by Talcott's method.

It is possible that instrument may find an application in determining stars of equal Z. D. north and south, and thus affording a check on any system of standard declinations. The east Y is movable in azimuth. The adjusting screw has 60 threads to the inch and each thread is about 100". The west Y is movable in level. The clamp in Z. D. reverses with the instru-

The escapement is Graham's. The pendulum is a steel rod which carries four steel jars in a cluster, each jar being filled with mercury. The seconds arbor has a steel scape-wheel of 30 teeth (one being cut away). This wheel touches a spring every 2s and sends a signal through a relay. The 58th second is omitted in every minute. A wheel on the five minute arbor has a notch 10s long cut into its rim. Into this notch a detent falls once in five minutes, and the signals are interrupted every five minutes from 50s to 60s. The clock thus sends break-circuit signals (to its own "hack-contact relay at the switch-board) every 2s with the exception of the 58th second in every minute, and the 52d, 54th, 56th and 58th, in every 5th min-

ute. From the relay either break or make signals can be sent. On the pendulum rod just above the bob is a screw thread, on which a little nut can be moved up and down about three inches of the length of the rod. This nut is made in the shape of a pilot wheel with eight spokes, one of which has been painted black. The nut is so placed as to bring the correction of the clock to as nearly zero as possible at noon of each day.

The mean time and sidereal chronometers have all been furnished by Negus & Co. of New York.

Messrs. C. Frodsham & Co. have provided a thermometric chronometer which was delivered in 1885.

The three chronographs of the observatory are all of the American pattern of single pen chronographs invented by the Messrs. Bond.

Chronograph No. 3 is mounted in the Transit

with the poles of a battery and a current flows through the key, clock or chronograph circuit corresponding to the plug. If two, three or four plugs are put under any spring jack, a battery current flows through the two, three or four instruments with which the plugs are connected. Thus any keys, clocks and chronographs can be united in the same circuit by placing their plugs under any battery spring-jack.

#### Measuring Engine.

The measuring engine is mounted upon a pier in the instrument room. It is very solidly constructed of brass, and rests upon a tripod base with foot-screws for leveling. A frame at the top 13½ inches square is fitted with a system of tracks and carriages, giving two motions (at right angles to each other) to the large central microscopes, whose position is indicated by glass scales parallel to the tracks, and read by

#### The Meteorological Instruments.

Although the Lick Observatory was not primarily destined for a meteorological station, its very exceptional situation creates a responsibility on its part to engage to some extent in making routine meteorological observations, and a suitable outfit for this purpose has been obtained. Correspondence was begun in 1883, looking to the making of observations of earth temperature, and in 1885 regarding the very important research of earthquake measurements. The elevated and isolated site of the observatory will render researches on astronomical refraction of especial value, and the disposition of the buildings and instruments has been made with this end in view.

#### Draper's Self-Registering Barometer.

In the pencil barometer the glass tube is 36

brass frame *d*, fastened to the back of the case. This frame also holds the upper ends of the steel springs *e e'*. The glass reservoir *c* is of the same diameter and length as the upper part of the tube *a*; on its open end is turned a flange to hold it in a brass frame *f*, to which are fastened the lower ends of the steel springs *e e'*; it also carries an ink-pencil *g* that touches the ruled paper on the board *h h*, which is drawn aside by the clock *i*. The spring *e'* is for the correction of temperature on the other springs, as will be described below.

The springs for weighing the reservoir are of steel wire, No. 22 English wire gauge, closely wound round a mandril one-half inch in diameter and 10 inches long, on which they are tempered hard, and afterward lowered to a suitable temper by being dipped in oil and ignited two or three times, the burnt oil forming a japan that prevents them from rusting.

HOWARD MEAN-TIME CLOCK.

SPHEROMETER.

ELECTRICALLY-CONTROLLED CHRONOGRAPH.

THE FAUTH CHRONOGRAPH.

house. It was made by Fauth & Co. in 1881. No. 1 is mounted in the large dome. It was made by Fauth & Co. in 1886. Chronograph No. 4 is by Warner & Swasey, and is mounted in the meridian circle house. The movement of the barrel of this instrument is electrically controlled by the marking clock.

#### Electric Switch-Board.

An electric switch-board was made in 1884 by Royce and Marsan of Washington from designs of Prof. Holden. The general principle of the board is that every observing key, chronograph and clock is connected with the board by a double line of wire. The wires are run in the shallow cellars below the main floors and in a tunnel between the main building and the Transit house. The key circuit wires are covered with blue covering; the clock circuits with brown; the chronograph circuits with blue and white. The battery circuits are covered with red and white covering, and from each battery a double line is run to the switch board.

All the key, clock and chronograph circuits terminate in plugs which consist of two plates of brass, one to each wire, separated by hard rubber. The battery circuits terminate in spring-jacks, which are plates of brass pressed together by a spring, but so made that ordinarily they do not touch. Hence no current usually flows. If any plug is put under any spring-jack its opposite sides are brought into contact

auxiliary microscopes. The object to be measured is placed upon a glass stage below the upper frame, and this stage is carried by a positive circle 12 inches in diameter, divided on silver to 5' and read by two verniers 65". The sliding tracks are provided with standards carrying small telescopes, which, when directed to collimators, serve to detect any deviation of the carriage from a straight line and to determine the necessary corrections.

For use in connection with the measuring engine, Professor W. A. Rogers of Harvard College Observatory has provided a standard bar 20½ inches long, containing a half-yard divided into inches and tenths, with two inches at one end minutely subdivided. This bar is of steel, its upper surface being truly plain and polished.

#### The Level-Trier and Spherometer.

The Messrs. Repsold have furnished the Observatory with a level-trier of refined construction. It seems to be perfectly adapted for the investigation of level tubes under various circumstances of temperature.

A spherometer by the Messrs. Fauth was furnished with the four-inch transit together with an apparatus for measuring the irregularity of pivots according to the plan described by Prof. Harkness, U. S. Navy in "Monthly Notices of the Royal Astronomical Society," Vol. 38, page 487. The spherometer has various other applications in the Observatory.

inches in length, the upper portion being of a larger diameter than the lower; it is held firmly in a fixed position, and filled in the usual manner with quicksilver; its lower or open end dips into a tube or reservoir containing the same metal. This reservoir is suspended on two spiral steel springs, and has freedom of motion up and down. When the pressure of the atmosphere diminishes a portion of the mercury flows out of the tube into the reservoir; this becoming heavier, stretches the steel springs, causing the ink-pencil fastened to them to mark downward. If the pressure increases the reverse movement takes place. The ink-pencil makes its mark on a ruled paper register, carried at the rate of half an inch per hour from right to left by a clock.

There is a third steel spring of the same length and strength as those on the reservoir, stretched by a weight to a distance equivalent to 30 inches on the barometer scale. The object of this spring is to give the correction of temperature for those sustaining the reservoir. The movements of the mercury on the register can be magnified to any required extent by increasing the length of the spiral springs.

The tube marked *a b* in the cut is of glass; the upper part is of a larger diameter than the stem *a*, being three-fourths of an inch internal diameter and 10 inches long, while the stem *b* is one-eighth of an inch bore and 26 inches long. The total length of the tube is therefore 36 inches. The reservoir *c* is suspended from a

Steel springs for instruments are generally made too short and thick; that is, there is a very small range between their normal condition and limit of elasticity. These barometer springs may be stretched five times their length without taking a set, while in the instrument they are never extended more than twice their length. Heat has a slight effect on them, causing them to lengthen about 1-16 of an inch for 90 degrees Fahr. To allow for this, the third spring *e'* is weighted with a lead weight and pencil; it marks its fluctuations on the upper line of the register sheet. Otherwise this instrument gives the correction for temperature (or reduction to 32 degrees) from the fact that it weighs the mercury instead of measuring its length, which is affected by heat.

Ink pencils of the barometer and other instruments are made by drawing narrow glass tubing to a fine point, which lightly touches the paper register, leaving a mark of red ink that has been diluted with about one-quarter of its volume of glycerine. The glycerine prevents the ink from drying too rapidly. The advantage of this form of pencil over lead ones is that it requires little or no pressure to produce a mark.

To receive the register of atmospheric fluctuations, a suitable ruled paper is fastened by means of small brass clamps, *h h*, to the board, *h h*, which is hung by rollers to the thick steel rod fastened to the sides of the case, on which

the paper is carried from right to left by the clock, *i*, at the rate of one-half an inch per hour, by means of the pulley on the hour arbor of the clock. The wire that connects the register board to the clock is of soft steel, number 28 wire gauge. Having only one turn round the pulley, it readily slides, so that the board can be pushed sideways for the adjustment of time, or for the renewal of the sheet of paper.

#### Draper's Self-Registering Rain Gauge.

About two feet above the roof of the building is placed the usual circular rain-gauge receiver, marked *a*; it is eight inches in diameter, funnel-shaped at the bottom and leads into a black-tin pipe *b*, three-eighths of an inch in diameter. This gauge is mounted on a square box that will be described below. The pipe descends from the gauge to the receiving or gravity bucket *c*, which is made of brass and is of a triangular prismatic shape, balanced

The observatory has two mercurial barometers, one by John Roach of San Francisco and the other by H. T. Green of New York. The latter has a bore of fifty-five hundredths of an inch and its index is so arranged as to read directly the twentieths of English inches—the argument of the Pulkowa refraction tables. The Green barometer is hung in the meridian-circle house. The cistern is 4306 feet above sea level. The Roach barometer has its cistern the same height. Its scale gives English inches and thousands.

The self-recording anemometer or wind-gauge is of the U. S. Signal Service pattern, and was mounted on the roof of the central portion of the main building in 1884.

#### The Earthquake-Recording Instruments.

The Observatory possesses a set of earthquake recorders, made from the designs of Prof. J. A. Ewing of Dundee. The cuts and description

movement by resolving it into three rectangular components—one vertical and two horizontal—and registering these by three distinct pointers on a sheet of smoked glass, which is made to revolve uniformly by clockwork. A single earthquake always consists of many successive displacements of the ground, hence the record traced by each pointer on the moving plate is a line comprising many undulations, generally very irregular in character. The amplitude, period and form of each of these are easily measured, and by compounding the three we obtain full information regarding the direction, extent, velocity and rate of acceleration of the movement at any epoch in the disturbance.

This group of instruments is shown in Fig. 1. In the center is a plate of smoked glass which gets its motion through a friction-roller from a clock furnished with a centrifugal governor, acting by friction fluid, and balanced so that its speed is not sensibly affected by the shak-

at right angles to each other, but with their indices inclined so that they write side by side on one radius of the plate. The pendulums are supported on a single stand, but with independent adjustments for position and stability. Each has two pivots, consisting of hard steel points which turn in sapphire centers. At the pivots and at the tracing point's every effort has been made to avoid friction. The indices are of aluminum, and a part of their weight is taken by springs (not shown in the figure), so that their pressure on the plate may be no greater than is necessary to produce a trace on the sooty film. The vertical component of motion is recorded by the instrument which appears behind the clock. A massive bar, free to move vertically about a horizontal axis, is held up by a pair of long spiral springs. Its equilibrium is made nearly neutral by applying the pull of the springs at a suitable distance below the horizontal plane through the axis of support, in the

DRAPER'S SELF-RECORDING BAROMETER.

just above and forward of its center of gravity in a square frame *d*, by two pivots, one of them marked *e*. These allow it to tilt when the water has reached a certain height or quantity. The leaden weight *f* is an adjustable counterbalance for the regulating of the tilting of the bucket. The square frame which carries this bucket is suspended to two steel springs *g g*, placed as is shown in the drawing; that is, parallel to the register sheet, the object being that when the bucket is emptying the pencil rises from the register and makes no return mark. The upper ends of these springs are fastened by suitable means to the top of the case. Between the springs and attached to the square frame is an upright rod *h*, going through a steady bracket *i*, and on its upper end an ink pencil *j*, which delicately touches the sheet of paper moved sideways by the clock *k*.

The square box alluded to in the preceding paragraph not only affords a support for the gauge, but retains warm air admitted from the gas-burner in the room below by means of an iron pipe *l*, which delivers the heated air close to the bottom of the funnel, melting any snow or sleet that may collect.

The funnel of the rain gauge is 36 inches above the roof, 33 feet above the summit level and 4333 feet above the sea.

are from *Nature* of August 12, 1886. There is a horizontal seismograph with clock and driving plate. The clock is started by an electric contact at the beginning of the earthquake, and the two rectangular components of the horizontal motion are registered side by side on a moving plate. There is a vertical-motion seismograph to register the vertical movement of the surface of the earth on the same plate. There is also a duplex pendulum seismograph, to give independent records of the horizontal motion on a fixed plate, the pencil being free to move in all azimuths. A chronograph attachment is used, which is set in motion at the beginning of a shock, and records the time of the occurrence by one of the standard clocks. It also marks the clock records on the revolving plate of the horizontal seismograph.

In the design of these seismographs (which we have before described in the *PRESS*) the object has been kept in view of making them easily capable of use by observers who have not made seismometry a special study. They are entirely self-recording and require little attention during the long intervals which must, in most situations, be expected to elapse between one period of activity and the next.

One group of instruments is arranged to give a complete record of every particular of the

DRAPER'S RAIN AND SNOW GAUGE.

ing of the ground. The clock is started into motion by means of a Palmieri seismoscope, which appears in the figure behind the plate on the right. This is a small common pendulum, whose bob carries at the bottom a piece of stiff platinum wire that projects into a recess in a cup of mercury below—the recess being formed by an iron pin standing lower than the surface of the surrounding mercury. On the slightest shaking of the ground, contact with the edge of mercury takes place, and this closes a circuit which releases an electro-magnetic detent and starts the clock. This occurs during the preliminary tremors which are usually found in advance of the main movement of an earthquake. The same circuit starts another clock (of the escapement type), which fulfills two functions: It marks time on the revolving plate during a part of the first revolution, and then continues to go as an ordinary clock, so that, by inspecting its dial afterward, the interval which has elapsed from the occurrence of the earthquake is known, and the date of the shock in hours and minutes is thus determined with as much precision as the phenomenon admits of. This part of the apparatus is omitted from the figure.

The two horizontal components of motion are recorded by a pair of horizontal pendulums set

manner described in the article, to which reference has already been made. A bell-crank lever with a jointed index gives a multiplied trace of the apparent vertical oscillations of the bar, which correspond to vertical displacements of the ground. In this instrument, as in the others, sapphire centers are used to minimize friction.

Records inscribed on the plate are preserved by varnishing the plate and using it as a negative to print photographs. The motion, as recorded, is magnified to an extent which experience of Japanese earthquakes has shown to be desirable in dealing with disturbances ranging from those which are just recognizable as earthquakes up to those which are, to some extent, destructive. For great earthquakes, separate apparatus of the same type is designed, in which the multiplying indices are dispensed with, and the scale and style of the other parts are considerably modified.

Another and distinct instrument is the duplex pendulum seismograph, shown in Fig. 2. A massive bob is hung by three parallel wires from the top of a three-cornered box, and is reduced to nearly neutral equilibrium by being coupled by a ball-and-tube joint to the bob of an inverted pendulum below it. The two form a system which can be made as nearly astatic as

is desirable, and so furnish a suitable steady point for the horizontal part of earthquakes movement in any azimuth. The motion is magnified and recorded by a vertical lever geared to the upper bob by a ball-and-tube joint supported on gimbels from a bracket fixed to the box, and furnished with a jointed index which writes on a fixed plate of smoked glass. Records of the kind which the duplex pendulum gives are, of course, incompletes in two important particulars; they show nothing of the vertical motion (which, however, is usually a comparatively small part of the whole) and they show nothing of the relation of time to displacement throughout the disturbance. But they exhibit very clearly the change of direction which the movements undergo, and the actual direction taken by any pronounced element of the shock.

### The Transfer.

On Friday, June 1st, the Lick Trustees, represented by Trustees Mastic and Plum and James T. Boyd, attorney for the Trustees, formally transferred to the University Regents, represented by Regents Hagar, Hallidie and Phelps, and John B. Mhoon, the attorney for the Regents, the Lick Observatory on Mount Hamilton, with all its appliances and appurtenances.

R. S. Floyd, President of the Lick Trustees, who was unable to be present, owing to his illness, sent the following statement, which details the history of this great undertaking from its inception to its completion and transfer:

To the Regents of the University of California—GENTLEMEN: The third trust in the deed of trust of Mr. James Lick reads as follows:

Third—To expend the sum of seven hundred thousand dollars (\$700,000) for the purpose of purchasing land, and constructing and putting up on such land, as shall be designated by the party of the first part, a powerful telescope, superior to and more powerful than any telescope ever yet made, with all the machinery appertaining thereto, and appropriately connected therewith, or that is necessary and convenient to the most powerful telescope now in use, or suited to one more powerful than any yet constructed; and also, a suitable observatory connected therewith. The parties of the second part hereto and their successors shall, as soon as said telescope and observatory are constructed, convey the land whereupon the same may be situated and the telescope, observatory and all the machinery and apparatus connected therewith, to the corporation known as the "Regents of the University of California," and, if, after the construction of said telescope and observatory, there shall remain of said \$700,000 in gold coin, any surplus, then said parties of the second part shall turn over such surplus to said corporation, to be invested by it in bonds of the United States, or of the city and county of San Francisco, or other good and safe interest-bearing bonds, and the income thereof shall be devoted to the maintenance of said telescope and the observatory connected therewith, and shall be made useful in promoting science; and the said telescope and observatory are to be known as "The Lick Astronomical Department of the University of California."

Richard S. Floyd, Charles M. Plum, George Schonewald and Edwin B. Mastic, surviving trustees of the James Lick Trust, have the honor, gentlemen, through me, their president, to report that:

First—We, together with our co-trustee, William Sherman deceased, have by purchase, and through gift by Congress, procured the necessary land at the site selected by Mr. James Lick himself for his observatory. This site is the summit of Mount Hamilton, in Santa Clara county, Cal., and the land secured amounts to 1571.59 acres.

Second—That after cutting off more than 75,000 tons of solid rock, to level the western summit of this land, "designated by the party of the first part," we have now successfully "constructed and put up" thereon, a powerful telescope which is "superior to" and is "more powerful than any telescope ever yet made." That we have provided it with all the "machinery appertaining thereto and appropriately connected therewith, or that is necessary and convenient" to this great telescope, "more powerful than any yet constructed," and that we have also completed the construction of a suitable observatory connected therewith.

Third—And that in further pursuance of this third trust the Lick Trustees are now practically ready, and offer to deliver and convey to you this land, telescope and observatory and \$90,000 in gold coin of the United States, and afterward whatever balance of the settlement of all accounts will show to be remaining of the \$700,000 set apart by Mr. Lick for this object.

Volume I, "Lick Observatory Publications," gives detailed descriptions of all the subsidiary instruments of the observatory. The instruments obtained since are immediately appurtenant to the great telescope, such as the star spectroscope, filar and duplex micrometers, photographic apparatus, etc., and are listed in an inventory to be submitted to you with the deeds of conveyance. Detailed and scientific description of these and of the great telescope will probably be left to your director for the next volume of "Lick Observatory Publications." The subsidiary equipment is considered excellent, but, of course, all such instruments have been made before and gave little trouble beyond ordering the most modern patterns from the best makers.

What really makes the Lick Observatory is the great telescope, with its machinery and its peculiar but splendid situation. To attempt a telescope greater than any ever yet made in the world involved new and experimental work, and in adapting it to its fit and proper site the peculiar circumstances of an exposed mountain peak new difficulties and problems constantly confronted us.

The most momentous question of all that have arisen in this work respected the style of telescope that should be attempted in order to achieve the most powerful instrument possible—whether a great refracting telescope or a great reflecting telescope. The most eminent astronomers of the world were divided or undecided upon this question. With the light of the best opinions, pro and con, a practical

consideration of the atmospheric conditions of our exposed site determined the trustees to decide in favor of a great reflector. It is doubtful if a very large reflector could have its power practically realized at a sight like Mt. Hamilton.

I do not propose to enumerate the many and varied difficulties encountered in accomplishing this observatory. There have been delays and disappointments, but these are unavoidable in a work of this kind. Time in such work is as insignificant a consideration as would be the danger that the heavens might fly away before we got ready to look. Considering all things, the trustees feel a grateful surprise that this observatory, with the most powerful telescope in existence, is an accomplished fact at all. Not until the great objective had safely arrived at the observatory on December 27, 1886, could the trustees feel any assurance that such would be the case. Then came the anxieties with the risks of transportation, of the mounting and the photographic lens, until December and January last. Any accident to these might have consumed the entire fund without completing the observatory as it now is. We feel reason to congratulate ourselves that more than our most sanguine expectations have been realized.

It was the special desire of Mr. Lick that this work should not be carried out according to one man's particular notions, nor built according to any single groove. The trustees have earnestly endeavored to carry out this broad idea of the donor.

FIG. 1.—Complete Three-Component Seismograph, for Motions in all Directions.

FIG. 2.—Duplex Pendulum Seismograph for Horizontal Motion.

### SELF-REGISTERING INSTRUMENTS FOR RECORDING EARTHQUAKES.

and in the Lick Observatory we submit to you a work which is the resultant of the most carefully studied and thoroughly discussed selections from the best advice and information that the trustees could obtain from the most eminent astronomers and the most famous opticians and mechanicians in the world. To gather from many sources the best information on every point and to shape the best ideas into a great observatory on a remote mountain has been no easy task.

Confident that the Lick Observatory will soon speak for itself in the world of science and to the honor and fame of our University of California, I am very truly yours, (signed) R. S. FLOYD, President Lick Trustees.

The deed of transfer was elaborately engrossed on parchment. It was decided that a public transfer of the observatory to the University, with appropriate speeches and ceremonies, be made at Berkeley on Commencement Day. Thomas E. Frazer, who was superintendent of construction at Mt. Hamilton, and who was present at the transfer, was deputed as messenger to convey to Mr. Robey, in charge of the observatory, notice of the transfer having been made, and to instruct Prof. E. S. Holden that he had been placed in sole charge of the observatory for the Board of Regents.

The trustees are preparing a medalion of James Lick to be placed on the pier of the great telescope, and marble tablets commemorative of those engaged in the work to be placed on the walls.

On Wednesday of next week, June 27th, which is Commencement Day at the University, the public ceremonies connected with the formal transfer of the Observatory will take place at Berkeley.

### The Organization.

The complete organization of the "Lick Astronomical Department of the University of California" is as follows:

HON. HORACE DAVIS, President of the University;  
EDWARD S. HOLDEN, LL. D., Director and Astronomer;  
SHERBURNE W. BURNHAM, A. M., Astronomer;  
JOHN M. SCHAFERBERG, C. E., Astronomer;  
JAMES E. KEELER, A. B., Astronomer;  
EDWARD F. BARNARD, Astronomer;  
CHAS. B. HILL, Asst. Astronomer, Sec'y and Librarian;

JOHN McDONALD, Machinist;  
CHARLES HARKORT, Janitor;  
CHAS. MCGUIRE, Laborer.

### Professor E. S. Holden,

The Director of the Lick Observatory.

Prof. Edward S. Holden has been identified with the Lick Observatory almost since its inception, having been consulted by the Lick trustees concerning the various important steps to be taken in the construction and equipment as the work progressed. When he was chosen by the Regents of the University of California as president of that institution of learning it was understood that when this observatory was

servers with the great 26-inch equatorial. Other astronomical researches in which he has been engaged with noticeable success are the distribution of the stars and the rectification of important star catalogues. In this former, he has carried on laborious observations and reductions in correction or reversal of the long-accepted hypothesis of the elder Herschel, that star distribution, taking the celestial regions as a whole, is quite uniform. Professor Holden's results tend, on the contrary, to show the decided non-uniformity of the general distribution.

In 1833 he conducted the Government expedition to the South Pacific to observe the transit of Venus. This work and results of this expedition are regarded as of the highest character. A similar quality is recognized in those of this Government party, likewise in his charge, sent to Colorado in 1878, to observe the total eclipse of the sun, with a view, particularly, to ascertain the nature of the corona. In 1881 he was appointed professor of astronomy in the University of Wisconsin, and Director of the Washburn Observatory at Madison in that State. There he engaged largely in researches on comets and star distribution.

The Wisconsin State Journal says of his work: During the five years of Professor Holden's administration, three volumes of the publications of the Washburn Observatory have been printed, and a fourth volume is ready for the printer. The astronomers have discovered and measured many new double stars, new nebulae, etc., and have lately been engaged in determining the positions of 303 fundamental stars for the southern zone of the Astronomische Gesellschaft. A number of important researches on the latitude of the observatory, on the astronomical refraction, etc., are far advanced, but must be left to be completed by Professor Holden's successor.

Professor Holden is well known as a writer in the field of his favorite sciences, partly as the joint author, with Professor Simon Newcomb, of notable mathematical and astronomical textbooks, but in a more important sense as an independent author. Besides his original researches, he has given to the public a life of Sir William Herschel, a work based on original materials previously inaccessible, and distinguished by every merit proper to the biography of a man of science. In this, as in all his writings, he shows himself not only the master of his technical specialty, but as a man of large general culture. He superintended the mounting of the instruments at the Lick Observatory. These have been mainly manufactured under his instructions, and are all of the most modern design, and the best calculated to perform the work required of them.

Prof. Holden has received the following honorary degrees: LL.D., University of Wisconsin (1886); LL.D., Columbia College (1887). He is a member of National Academy of Sciences (Washington), Philosophical Society (Washington), Amer. Ass'n. Adv. Sci. (Salem), Cal. Acad. Sciences (S. F.), Cal. Historical Society (S. F.), German Astronomical Society (Leipzig), Corresponding Member of Appalachian Club (Boston), Microscopical Society (S. F.), Acad. of Sciences (St. Louis), Honorary Member Rensselaer Society of Engineers (Troy), Honorary Associate Liverpool Astronomical Society, Associate Fellow American Acad. Arts and Sciences (Boston), Foreign Associate Royal Astronomical Society (London).

While Professor Holden was president of the University, he prepared, under the direction of the Lick trustees, Vol. I of "Publications of the Lick Observatory of the University of California." This work of some 300 pages gives a history of the Observatory and descriptions of some of the appliances.

The most valuable portion of the volume to the scientific reader, and what will most interest astronomers, is embraced in the various tables. As a general rule, during the first year of practical work of an observatory, a large amount of time is consumed in preparing necessary tables. But the astronomers will find all this done for them by Professor Holden. The tables are the most complete ever published, so that the work ought to be reduced with great accuracy. Any one who will examine these tables intelligently will readily understand that Professor Holden certainly occupied well what time he could spare from active duties at the University while president.

Table I gives the star factors  $A$ ,  $B$ ,  $C$  and  $D$ , for every 10' of declination from 47° to 40' south declination to north 80°. These are the usual factors for azimuth, level and collimation of the transit instrument; the fourth quantity,  $D$ , is the numerical value of the tangent of the declination, which is used in the computation of Bessel's method, wherein the "constants" of the transit are supposed to vary but little and are known. The second part of the same table includes the same factors for every individual star of the Berliner Jahrbuch, computed for the period 1900, and with the changes for 100 years.

Tables III, IV and V comprise extensions of Bessel's well-known refraction tables, with correction for the atmospheric and barometric conditions prevailing at the altitude of the observatory; also differential refractions in right ascension and declination for the circle and micrometer observations. They are preceded by a discussion on the theory by Prof. Comstock, who has elaborated all the terms of the formula to meet all possible conditions.

Table VI is an extended tabulation of the sun's parallax in right ascension and declination, with auxiliary lists for extending the ta-

completed he would resign from that position and assume the directorship of the Observatory, and this program has been carried out. The Observatory, under the terms of the James Lick trust deed, is under the general control of the University Regents.

Prof. Holden has achieved a wide and lasting reputation as an astronomer, and the value of his work is thoroughly recognized in the scientific world. His unusual attainments in mathematics were acknowledged early in his life. He graduated from the scientific department of the Washington University as B. S. with the highest distinction in 1866. With the view of a mathematical career, he secured an appointment as cadet in the United States Military Academy. Here he graduated in the foremost rank in 1870. The exceptional extent of the preparation for the West Point course, which his college graduation and his rare opportunities that a great mathematical mind had given him, enabled him to devote an unusual amount of time outside of his class routine to the private mathematical studies that formed his absorbing pursuit. He was Second lieutenant of the Fourth United States Artillery from 1870 to 1872, when he became Second-lieutenant, United States Corps of Engineers. In 1873 he resigned, and was commissioned Professor of Mathematics in the United States Navy, which commission he resigned in June, 1882. He was Assistant Professor of Natural and Experimental Philosophy at West Point, 1871-72, and Instructor in Practical Military Engineering, 1872-73. In 1873 he was appointed Astronomer of the United States Naval Observatory at Washington. He was there long one of the ob-

bles to other parallaxes of the heavenly bodies, and for adapting the same tables to other observatories.

Table VII gives the hour angles and azimuths of a body in the horizon; and VIII the true zenith distances for the latitude and elevation of the Lick Observatory.

Tables IX to XIV are tabulations of several quantities useful in abridging the work of computation, to be undertaken by Prof. Holden and his assistants; and the six other tables which conclude the list are copied from the Leipzig observations (as stated in the introduction), and do not particularly appertain to the location of the Lick Observatory.

S. W. Burnham.

S. W. Burnham of Chicago is a most distinguished astronomer. He is a Fellow of the Royal Astronomical Society and a member of the German Astronomical Society of Berlin. He is a regular contributor to the Royal Society Monthly Notices. His specialty is the discovery and measurement of double stars, with the correction, codification and arrangements in the order of right ascension, of the work that has been done by previous observers—the Herschels, Struves and others. His "General Catalogue of the Double Stars" will soon be printed by the Naval Observatory at Washington, and will comprise a work of some 500 pages. All the discoveries and observations which gave him such a reputation abroad have been done with a six-inch telescope. The work done with this has tested the sight of the best European observers.

At the suggestion of Prof. Holden, the Lick Trustees invited Mr. Burnham to Mt. Hamilton in 1879 to test the site of the observatory astronomically. This report is printed in Vol. 1 of the "Publications." When Prof. Holden was elected director of the Lick Observatory, his first nomination for any position was that of Mr. Burnham. Up to this time he has had to support himself as a stenographer, and only "followed" astronomy in his leisure moments. Mr. Burnham is a skilled amateur photographer, and at the recent meeting of the National Association of Photographers at Chicago the gold medal was awarded to him above all the professionals. He will have a chance here to test his skill with the fine photographic lens of the Lick Telescope. An eminent astronomer, in speaking of Mr. Burnham, says: "He is the greatest double-star observer that ever has lived; he is the greatest double-star observer now living, and the greatest that ever will live."

J. M. Schaeberle.

Professor Schaeberle is of German birth (born in 1854) but came to this country as a child. He served his apprenticeship as a machinist. During that time he procured a small telescope, and went back to school desiring to become an astronomer. When he graduated at the University of Michigan in 1876, he was appointed assistant to Prof. Watson, director of the Ann Arbor Observatory. He was gradually promoted until he became assistant professor of astronomy in the University.

He has built several reflecting telescopes with his own hand. His astronomical work has been mainly observing with the meridian circle, and his numerous papers published in the astronomical journals have been upon problems connected with meridian circle work usually. He has discovered two comets with telescopes made by himself.

James E. Keeler.

James Edward Keeler was born in La Salle, Illinois, September 10, 1857. As a boy he was always fond of mechanical and scientific pursuits. In 1869 he went to Florida with his parents, and in 1875 and 1876 was engaged in surveying around the mouth of the St. Johns river, and became interested in astronomy by endeavoring to find a meridian line. He began astronomical observations at this time with a telescope and transit instrument of his own construction, and also studied for college. In 1877 he went to the John Hopkins University in Baltimore. He observed the total solar eclipses of July 29, 1878, with the party in charge of Professor Holden, at Central City, Colorado.

Mr. Keeler graduated (A. B.) from the university in June 1881, and was engaged by Prof. Langley as an assistant on an expedition to Mount Whitney, Cal., to observe the sun from a great elevation. On returning from Mt. Whitney, he remained at the Allegheny observatory to assist in preparing the results of the expedition for publication. In May 1883 he went to Europe and studied physics with Prof. Quincke in Heidelberg and Prof. von Helmholtz in Berlin. On returning, after 14 months absence, he was again engaged as a regular assistant at the Allegheny observatory, working principally on the determination of obscure wave-lengths, and the distribution of energy in the lunar spectrum.

Mr. Keeler was appointed assistant astronomer under the Lick Trust in April 1886, and has resided on Mount Hamilton since that time. He was appointed astronomer in the Lick observatory January 14, 1887, to date from the official transfer of the observatory.

Most of the work done at Allegheny is embodied in the publications of the observatory, and at Mount Whitney in the official report of Professor Langley (Professional Papers of the U. S. Signal Service, No. XV). Other published papers of Mr. Keeler are the following:

Report on the Total Solar Eclipse of July 29, 1878, Washington obs. for 1876.

The Transit of Venus of Dec. 6, 1882, *Sidereal Messenger*, Feb. 1883.

On Repolishing Optical Surfaces of Rock Salt, *Sidereal Messenger*, July, 1886.

The Absorption of Radiant Heat by Carbon Dioxide, *American Journal of Science*, Sept. 1884.

The Total Eclipse of the Moon, June 11, 1881, *Sidereal Messenger*, July, 1881.

Article "Bolometer," *Encyclopædia Britannica*, supplement.

The Time Service of the Lick Observatory, *Sidereal Messenger*, September and October 1887.

Electrical Contact Apparatus for Astronomical Clocks, *Sidereal Messenger*, Jan. 1888.

First Observations of Saturn with the 36 Inch Equatorial of the Lick Observatory, *Sidereal Messenger*, Feb. 1888.

Mr. Keeler is also the writer of many newspaper articles. He has never joined any societies or associations.

The special work on which he will be engaged at the Lick observatory will be spectroscopic observations with the great telescope, and physical observations in general.

E. E. Barnard.

Edward Emerson Barnard was born in December, 1857, in Nashville, Tennessee. His mother was early left a widow, and our young astronomer was her only support. He entered the employ of a photographer, and, by hard study during his leisure hours, soon became familiar with the great science of astronomy, and, first with a "spyglass" and then with a more pretentious telescope, he began systematic work, studying at the university in the mean-

time. Several brilliant discoveries attracted attention to his work, and his profession of photographer was given up in 1883 to accept a position as astronomical observer at the Vanderbilt University Observatory, having charge of that observatory until September, 1887, when he resigned his position and that of instructor in astronomy in the Vanderbilt University to accept the position of astronomer at the Lick Observatory.

He graduated from the School of Mathematics of the Vanderbilt University in June, 1887.

He was elected Fellow of the American Association for the Advancement of Science in 1885, and in February, 1888, was elected Fellow of the Royal Astronomical Society of London.

In 1879-80 he made a special observational study of the planet Jupiter with five-inch refractor, making a complete series of drawings and observations of that planet.

In 1881 he began comet-seeking and miscellaneous observations, and through patience and perseverance discovered the following comets: Sept. 17, 1881, discovered comet 1881 VI; Sept. 13, 1882, discovered comet 1882 III; July 16, 1884, discovered comet 1884 II, short period (5.3 yrs.) comet; July 8, 1885, discovered comet 1885 II; Dec. 3, 1885, discovered comet 1886 II; Dec. 27, 1885, discovered comet 1885 V, (independent discovery); Oct. 4, 1886, discovered comet 1886 IX; Jan. 23, 1887, discovered comet 1886 VIII; Feb. 16, 1887, discovered comet 1887 III; May 12, 1887, discovered comet 1877 IV. He also discovered a group of companion comets to the great comet of 1882, and was the first person to discover and announce the breaking up of the nucleus of that comet.

He discovered the duplicity of the seventh magnitude star Beta, one Capricorni, on Nov. 6, 1883, at the moment of occultation by the moon. This star could not be seen as a double in the telescope with which its duplicity was discovered. This peculiar discovery was made by noting that the disappearance of the star was not absolutely instantaneous, as it would have been if it had a single star. He published his observation and his expectation that he had discovered a close double star which was con-

firmed by some of the giant telescopes of the country.

He has already discovered 7 new nebulae since he began his work at the Lick Observatory, making 30 altogether that he has found.

He experimented at the Vanderbilt Observatory in celestial photography, making a number of good photographs of the moon with the 6-inch refractor. He has made a special study of the Gegenschein, a peculiar zodiacal phenomenon; also of the trains of meteors, with special references to air currents in our upper atmosphere. He has published numerous astronomical papers in the *Astronomische Nachrichten*, *Gould's Astronomical Journal*, *Sidereal Messenger*, *Science* (of N. Y.), etc.

At the Lick Observatory he will be engaged in celestial photography, comet-seeking, and observations with the 36-inch equatorial and smaller telescopes.

Charles B. Hill.

Charles B. Hill, assistant astronomer, secretary and librarian, is well known in this city, where he has resided since 1873. Mr. Hill was born in Philadelphia, Pa., Sept. 17, 1863. He attended the West Pennsylvania Square Academy, Philadelphia, and the Tamalpais Academy, San Rafael, and afterwards Heald's Business College, graduating from the latter institution in 1876. He graduated from First-Grade Lincoln School, in this city, in 1887, and from the Boys' High School in 1880. He gave up the Harvard Post-Graduate preparatory class and entered the employment of Prof. Geo. Davidson, sub-office U. S. Coast and Geodetic Survey in San Francisco in 1881. Mr. Hill became interested in astronomical work in the

## Naming Mt. Hamilton.

The following letter from Prof. Wm. H. Brewer, so well and favorably known on this coast and elsewhere, settles all doubts as to the naming of this mountain made famous by the erection of the Lick Observatory. It effectually discards the weak story that the mountain was named after some rancho in the vicinity named Hamilton:

Yale University, Sheffield Scientific School, }  
New Haven, Conn., January 31, 1888. }

Mr. A. T. Dewey, San Francisco, Cal.—

DEAR SIR:—Yours of the 4th ult. is just received, asking me for the facts concerning the naming of Mt. Hamilton, upon which the Lick Observatory is located, etc.

I made the acquaintance of Rev. Laurens Hamilton at Ovid, N. Y., in 1853, where his first pastorate was, and where he remained about two years—1853 to 1855. I was then a teacher in the "Ovid Academy," as was also Miss Isabella Mead, whose acquaintance he there made and whom he married in May, 1855, just before his starting for California. Certain personal matters, which need not be given, made our mutual friendship with both him and his wife especially intimate and pleasant. I next met him in August, 1861, when, in charge of the little field party of the State Geological Survey, I camped in the suburbs of San Jose, where Mr. Hamilton was then preaching, and during our short stay there I was often at his house. Prof. Chas. F. Hoffman, topographer of the State Survey was with us, and thus became acquainted with Mr. Hamilton.

We had already been on all the chief points about San Jose, Pacheco's Pass, New Almaden, etc., and from various points had noted about where the highest point in the mountains east of the Santa Clara valley was located.

On Sunday I attended Mr. Hamilton's church, and, in the afternoon, took tea with him and mentioned that we would attempt to reach the highest peak east on the next day. He wanted to go with us, and early the next morning (Monday, August 26, 1861) he was at our camp. He, Mr. Hoffman and I made up the party.

There were no special difficulties met with, other than those incident to the absence of tracks, the occasional fields of brush, and our ignorance as to the best route. There were no trails, nor had I obtained any information of the country beyond the laguna (probably at Smith's creek). We finally picketed our mules and made the last three miles on foot. Hoffman and I were encumbered with our instruments, and, as we neared the summit, Mr. Hamilton pushed on ahead of us, and reaching it, swung his bat in the air and shouted back to us: "First on top—for this is the highest point."

The air changed to be unusually clear for the time of year, and the views were correspondingly fine, especially to the westward.

Night caught us while still in the mountains, but we reached our camp before midnight.

I thought it probable that this peak which is somewhat conspicuous from the heights on the opposite side of the valley, must have already some name, but I failed to find any. I made diligent inquiries then and later both thereabouts and elsewhere. Indeed, any definite information about the interior of that chain was seriously scanty, considering how long the Santa Clara valley had been settled. It had been well prospected over between 1849 and 1860, but beyond the fact that paying gold was not to be found in the streams, and that there were plenty, I got little information.

When we worked up our notes in the office, and failing to find any old name in use, Hoffman and I, after discussing two names, agreed to call it Mt. Hamilton.

This is how it happened that the now celebrated mountain came to bear the name of that able and true man.

I have a clear remembrance of the events, and I write this letter after referring to my original notes made at the time.

Yours Truly, Wm. H. Brewer.

The Rev. Dr. Hamilton was a well-known divine on this coast, and a very popular one in Oakland, where he resided for many years. He was a man of progressive spirit, a deep thinker, and a writer of ability. He "died in harness," as the saying goes, being suddenly stricken while in the pulpit delivering a sermon. In view of what has been stated in the above letter his name was fittingly bestowed upon the now famous mountain, from the summit of which, by the way, the old home of James Lick, who originated and endowed the Lick Observatory, may be seen.

**SALARIES.**—The salary of Prof. Holden as Director and Astronomer of the Lick Astronomical Department of the University of California is \$5000 per annum; that of S. W. Burnham, astronomer, \$3000; J. M. Schaeberle, astronomer, \$2000; J. E. Keeler, astronomer, \$1400; E. E. Barnard, astronomer, \$1200; C. B. Hill, secretary, \$1000; John McDonald, machinist, \$700; Chris. McGuire, laborer, \$720, and Charles Harkort, janitor, \$720.

THE reports on Mt. Hamilton geology were made by Prof. C. R. Van Hise, of the University of Wisconsin, and Prof. A. Wendell Jackson, of the University of California.

E. S. HOLDEN, DIRECTOR OF THE OBSERVATORY.

## James Lick.

The philanthropy of James Lick has made his name more famous than that of any other Californian. For some time before his death (which occurred in October, 1876) he was engaged in plans for devoting his great wealth to the benefit of the public. His dissolution was painless and peaceful. The body was free from disease, and death was simply the result of the complete wearing out of the system. He had been gradually sinking for the previous ten days, and he was fully conscious of his earthly career was rapidly drawing to a close. He conversed cheerfully of his approaching death, and manifested a spirit of thorough resignation. His thoughts were chiefly centered on the execution of his will as expressed in the deed of trust, and his conversations related principally to the consummation of his public benefactions. The only regret with which he surrendered his life was that he was not permitted to see his various projects carried out.

Although Mr. Lick, whose portrait is published in this number of the PRESS, was a resident of California for many years, he was very little known even in San Francisco, being a man of eccentric and peculiar habits and avers to mixing with his fellows. When, however, he suddenly announced his intention of giving his immense fortune to scientific and charitable objects, his name and fame was spread abroad through the land, and no Californian was better known abroad than James Lick. The money which he had accumulated during his long life was given to a board of trustees, who were to carry out the plans devised by the donor on broad and generous principles. The philanthropist changed the board of trustees several times, which led some persons to believe that he had repented of his resolution, but in each instance the property was turned over to a new board in the same manner as to the first. He also changed the trust deed once, by modifying certain bequests, increasing others, and leaving a certain amount of money to his relatives.

Whatever may have been his reasons for making the change, the fact remains that the bulk of his immense wealth is being distributed in various practical ways to the people. He was considered an eccentric man, but surely the eccentricity which leads a millionaire to divest himself of property valued at millions and give it, during his lifetime, to the people among whom he lived, is to be commended. This he did, and whatever may have been his idiosyncrasies, the crowning act of his life shows that the heart was in the right place and that his fortune was bestowed in accordance with long-cherished convictions and matured plans. Mr. Lick was a man whom even those nearest to him did not understand or appreciate. He never had credit for the sterling qualities he possessed. His greatness of wisdom and generosity will be more and more appreciated as the years roll on and all his bequests are carried out.

For presenting a biographical sketch of James Lick the materials are meager. He lived in seclusion, and even when engaged actively in business pursuits was little known even to those with whom he was brought in contact. He was born August 25, 1796, in Fredericksburg, Penn. He was a descendant of one of the Revolutionary fathers, William Lick, who emigrated from Germany to America previous to the war of Independence, in which he took an active part. James Lick was taught the trade of a cabinet-maker and carpenter, and served for a while in a pianoforte manufactory in Baltimore, Maryland.

His restive spirit, however, attracted him in 1820 to Buenos Ayres, and there he remained for 12 years, accumulating by industry and his speculative insight the good round capital of \$40,000. For a season Mr. Lick returned to Pennsylvania, and seriously bent himself toward establishing a manufactory of pianofortes in Philadelphia, but after leasing ground and erecting buildings he gave up the project and returned to Buenos Ayres. Matters were there not to his liking, and he is heard of next at Valparaiso, in Chili, where commerce and pianos gave him occupation for a few years. From Chili he went to Peru, and there devoted himself to his business in cabinet-work and pianofortes for 10 or 11 years.

Mr. Lick arrived in San Francisco in 1847, having with him his entire wealth, amounting to the sum of \$30,000. He invested all his capital and all earnings in real estate. The most promising portion of the city in those days was then what is known as North Beach. Most of Mr. Lick's investments were made in that locality, and owing to the subsequent abandonment of that section as a business center, advanced but little in value. He extended his investments, however, to other parts of the peninsula which have since become the very heart of the great city. Then the lots he purchased were more and more and cost him but a trifle. The lot on which the Lick house now stands is said to have been bought by him for an ounce of gold. All the city property, outside of North Beach, in which Mr. Lick invested, multiplied in value rapidly and he built up the immense fortune which he in later years enjoyed. He also invested money in Santa Clara and Los Angeles counties, purchasing in the latter county a portion of the Rancho de Los Felis and the island of Santa Catalina. With the exception of the Lick house lot and the property in Santa Clara, Mr. Lick was rather conservative in this matter of improvements. The structure which bears his name was, however, at the period of its

erection, far in advance of the times. The property at Santa Clara he improved for his own residence, and, on a piece of land near San Jose, erected a flour-mill, on which he lavished about \$200,000, almost all the woodwork in the same being of mahogany.

After a lifetime spent in the pursuit of riches, on the 2d of June, 1874, Mr. Lick executed a deed of trust in which he divided nearly all his vast fortune for public benefactions, and appointed a board of trustees. Estimates of the estate at that time placed its value at \$5,000,000. We append a list of the donations of the last trust deed as it now stands. We omit any account of the schedule of property, and, in speaking of the gifts, summarize them from the deed:

To his son, John Henry Lick, he gave \$150,000; to John H. Lick, of Fredericksburg, Pa., \$3000; to Henry Lick, of same place (his half-brother), \$5000; to his sister, Sarah Hepler, \$5000; to his niece, \$2000; to another niece, \$2000; to his nephew, James W. Lick, of Santa Clara, \$2000; to Thos. E. Fraser, of San Jose, \$2000.

The trustees were required to expend the sum of \$700,000 for the Lick Observatory. The provisions concerning the telescope are printed in another column in this number of the PRESS.

The Society for the Prevention of Cruelty to Animals, of San Francisco, receives \$10,000,

monument to Francis Scott Key, author of the "Star Spangled Banner." This is being erected in Golden Gate Park, and will be uncovered on the 4th of July next.

The sum of \$100,000 is to be expended in a group of bronzes statuary at the City Hall, San Francisco, which shall represent by appropriate designs and figures the history of California; first, from the early settlement of the Missions to the acquisition of California by the United States; second, from such acquisition by the United States to the time when agriculture became the leading interest of the State; third, from the last named period to the 1st of January, 1874.

The trustees are to found and endow, at a cost of \$540,000, an institution to be called "the California School of Mechanical Arts," the object and purpose of which shall be to educate males and females in the practical arts of life, such as working in wood, iron and stone, or any of the metals, and in whatever industry intelligent mechanical skill now is or can hereafter be applied; such institution to be open to all youths born in California. The institution shall be founded and endowed under the direction of said Dr. J. D. B. Stillman, Horace Davis, A. S. Hallidie, John Oscar Eldridge, John O. Earl and Hon. Lorenzo Sawyer, and the survivors of them.

After making these payments, the residue

JAMES LICK—THE FOUNDER OF THE OBSERVATORY.

with a hope that similar societies will be organized in other towns of California.

The Protestant orphan asylum, of San Francisco receives \$25,000.

The sum of \$25,000 is given to the city of San Jose to erect a free orphan asylum, without regard to creed or religion of parents.

The Ladies' Protection and Relief Society, of San Francisco, receives \$25,000.

The Mechanics' Institute, of San Francisco, receives \$10,000 for the purchase of scientific and mechanical works.

The sum of \$5000 has been expended in a monument to his mother, Sarah Lick; \$5000 for a monument to his father; \$5000 for a monument to his grandfather, William Lick, who died near Morristown, Pennsylvania, at the age of 104 years, to commemorate the services rendered by him in the American struggle for independence, and the hardships he suffered at Valley Forge and other places during the struggle; all of said monuments were erected at Fredericksburg; and the further sum of \$5000 in the erection of a granite monument to the memory of his sister Catherine, at her burial place, Pennsylvania.

Out of the proceeds of the estate the sum of \$100,000 is set aside to found an institution to be called the "Old Ladies' Home," as a retreat for women who are unable to support themselves and who have no means of their own. The trustees of this are A. B. Forbes, J. B. Roberts, Ira P. Runkin, Robert McEroy, and Henry M. Newhall.

The sum of \$150,000 is to be expended for free baths in the city of San Francisco. H. M. Newhall, Ira P. Runkin, J. D. B. Stillman, and John O. Earl are the trustees.

The sum of \$60,000 has been expended for a

and proceeds of the estate is to be conveyed in equal portions to the California Academy of Sciences and the Society of California Pioneers, to be expended in the purchase of a library holding natural specimens, chemical and philosophical apparatus, rare and curious things useful in the advancement of science, and generally in carrying out the objects of the societies.

Mr. Lick reserved to himself his homestead in San Jose, during his life, but on his death it went to the Pioneers and Academy of Sciences. He had previously given to these societies each a lot 80x275, on Market and Fourth streets, the lots being valued at about \$200,000 each. These lots are aside from the deed of trust, and the societies have possession, the Pioneers having put up a fine building on their property.

It is now known that had the property of James Lick been sold soon after his death, at a time of real estate depression in this State, it would have barely realized sufficient to carry out his plans, leaving little for the Pioneers and Academy of Sciences. Now, however, the real estate has advanced materially and those two organizations expect to realize \$300,000 to \$400,000 each as residuary legatees after all the bequests are fulfilled. The Lick Trustees have been receiving a steady income from the real estate and bonds since the donor's death, and a handsome sum has accumulated.

The largest single sum left by Mr. Lick was that intended for the observatory, which is as completely described in this number of the PRESS. This observatory fittingly forms his monument. According to an arrangement made before Mr. Lick's death, Mt. Hamilton was selected as the permanent resting-place for his remains. This was not by his direction, and it must not be thought that he had any vain idea

of securing a lasting monument for himself in his establishment of the observatory. It was thought fitting by his friends that his tomb should be the solid pier of masonry upon which rests the magnificent telescope which he has given to the people of this State—the greatest telescope that the world has thus far seen. In January, 1887, the remains of Mr. Lick were removed from San Francisco to Mt. Hamilton and are now safely inclosed as was planned years ago. The final burial was conducted with simple ceremonies, as will be described.

The remains were taken from San Francisco to San Jose by rail on Saturday, January 8, 1887, with an escort of gentlemen representing the various institutions which have been intrusted with the management of Mr. Lick's benefactions. San Jose was reached at 11 A. M., a procession of citizens of San Jose followed the remains to the borders of the city, and thence to the mountain the body was accompanied by those who went from this city and by the Mayor of San Jose. The mountain-top was reached at about 5 o'clock P. M., and the party proceeded at once to the rotunda, where the casket was opened and the remains identified by Capt. Fraser and others. They then proceeded to the library, where Prof. George Davidson read the memorial document of identification as follows:

This is the body of JAMES LICK, who was born in Fredericksburg, Penn., August 25, 1796, and who died in San Francisco, Cal., October 1, 1876.

It has been identified by us and in our presence has been sealed up and deposited in this foundation pier of the great equatorial telescope this ninth day of January, 1887.

In the year 1875 he executed a deed of trust of his entire estate, by which he provided for the comfort and culture of the citizens of California, for the advancement of Handcraft and Redecraft among the youth of San Francisco and of the State; for the development of scientific research and the diffusion of knowledge among men, and for founding in the State of California an astronomical observatory to surpass all others existing in the world at this epoch.

This observatory has been erected by the trustees of his estate, and has been named the Lick Astronomical Department of the University of California, in memory of the founder.

This refracting telescope is the largest which has ever been constructed, and the astronomers who have tested it declare that its performance surpasses that of all other telescopes.

The two disks of glass for the objective were cast by Ch. Fell of France, and were brought to a true figure by Alvan Clark & Sons of Massachusetts.

Their diameter is 36 inches and their focal length is 56 feet 2 inches.

Upon the completion of this structure, the Regents of the University of California became the trustees of this Astronomical Observatory.

The board of trustees of the Lick estate:

RICHARD S. FLOYD, President.  
E. B. MASTICK,  
CHAS. M. PLUM,  
GEORGE SCHONEWALD.

The President of the Board of Regents of the University of California and Governor of the State of California.  
WASHINGTON BARTLETT,  
(by J. W. Winans.)

The President of the University of California and Director of the Observatory.  
EDWARD SINGLETON HOLDEN.

The President of the California Academy of Sciences and of the council thereof.  
GEORGE DAVIDSON.

The President of the board of trustees of the California Academy of Sciences.  
GEORGE E. GRAY.

The President of the Society of California Pioneers.  
GUSTAVE REIS.

A director and ex-President of the Society of California Pioneers.  
PETER DEAN.

The Mayor of the City of San Jose.  
C. W. BREYFOGLE.

The preparation of the above document was assigned to Prof. Geo. Davidson. It was approved and then engrossed in handsome style with India ink on fine parchment.

After the signatures given above were affixed the document of identification was inclosed between two finely tanned skins, hacked by black silk and soldered in a leaden box 18 inches long and of the same width, and one inch in thickness. It was placed upon the iron casket, after which the lining of the oak casket was soldered up air-tight and the oak lid screwed down. The casket was then draped with an American flag and left in charge of a watchman until the following morning.

On Sunday morning at 11 o'clock the gentlemen who had escorted the body to Mt. Hamilton ascended the gang-plank leading to the foundation-stone, and, arranging themselves around the vault, now containing the casket, with uncovered heads, were addressed by the president of the Lick trustees, Captain R. S. Floyd, in the following words:

"Gentlemen: We are here to place the remains of James Lick in their final resting-place beneath this stone foundation of the pier upon which will be mounted the great telescope that he has given to California and the world of science."

"Mr. Lick left no positive instructions as to the disposition of his remains. The idea of making this place a tomb for his body did not enter the motive of his magnificent bequest which has created this great work. The idea was suggested to him long after he made his trust deed, and it met with his approval."

"The trustees have concluded, with the approbation of his son, John H. Lick, now in Pennsylvania, to place his remains in this pier, believing that the most powerful telescope so far made in the world will make his most appropriate monument, and this commanding site overlooking his California home his most fitting resting-place."

At the conclusion of the president's remarks,

workmen placed strong iron bars upon the abutments of the vault, upon which was placed heavy iron sheeting. The vault was then built with brick and mortar to the level of the foundation-stone.

A great stone weighing 2½ tons was then swung, being already suspended for the purpose, and let slowly down upon the brickwork, beneath which was the casket. Three other stones of the same weight were then placed in position, when the four were bolted by suitable bolts, running down to the foundation five feet. On top of the stones has since been set the first section of the iron pier of the great telescope. The heavy pier itself has been completed, and the telescope mounted in position.

### The Trip to Mt. Hamilton.

#### A Magnificent Mountain Stage Ride.

The road from San Jose to Mt. Hamilton was built at the expense of the county of Santa Clara and cost about \$90,000. No more magnificent mountain road exists in the United States when all the circumstances of line scenery, excellent road-bed and extensive and commanding views are considered. The road rises 4000 feet in 22 miles, and the grade nowhere exceeds 6½ feet in 100, or 343 feet to the mile. Most of the road is materially less steep than this. The first four miles (of the 20) is a fine nearly level avenue, laid out in perfectly straight lines, in the Santa Clara valley. The ascent of the foothill is then commenced, and the road begins a series of twistings and turnings which are necessary in order to keep the gradient low. Toward the end of the route the road winds round and round the flanks of the mountain itself and overlooks one of the most picturesque of scenes. The lovely valley of Santa Clara and the Santa Cruz mountains 2000 to 3000 feet to the west, a bit of the Pacific and the Bay of Monterey to the southwest, the Sierra Nevada (13000 to 14,000 feet) with countless ranges between to the southeast, the San Joaquin valley with the Sierras beyond to the east, while to the north lie many lower ranges of hills, and on the horizon Mount Shasta or Lassen's Butte (14,350 feet) 175 miles away. The Bay of San Francisco lies flat before you, like a child's dissecting map, and beyond it is Mt. Tamalpais (2587 feet) at the entrance to the Golden Gate. Monte Diablo (3843 feet) lies to the northeast, 41 miles distant. Mt. St. Helena (4343 feet) is not visible. Mt. Hamilton thus dominates all its neighbors and holds a singularly isolated place.

The City of San Jose, the nearest point of railroad communication from Mt. Hamilton is 50 miles south of San Francisco. Mt. Hamilton by the highway is 26 miles from San Jose, nearly east. The distance between the Observatory and San Jose in an air line is only 13 miles.

The approximate geographical position of the Observatory peak is: Longitude, 2 hours, 58 minutes, 22.2 seconds (Washington). Latitude, 37° 20' 25". The elevation of this point is 4210 feet above the level of the sea. The north peak, which is about three fourths of a mile distant, is 146 feet higher. The ridge between is lower, along which is a good trail connecting the two peaks. The sides of the mountain in most directions are very steep, and form an acute angle at the summit. The view from the peak is unobstructed in every direction, there being no higher ground within a radius of 100 miles.

At sunset the Pacific ocean is seen over the summit of the Coast Range at various points; and occasionally a snow-covered mountain is seen in a northerly direction. The great range of the Sierra Nevada, about 130 miles distant, comes out sharp and distinct at sunrise.

On the mountain there is but little to be feared from the ocean fogs, as they seldom reach this elevation. Very frequently commencing at or soon after sunset, this fog comes in from the Pacific at the Golden Gate on the north and the Bay of Monterey on the south, and covers the whole valley between the base of Mt. Hamilton and the Coast Range with a dense mass of vapor, resembling, when seen from above, a great white sea, the tops of the lower hills standing up through it like islands. Ordinarily it is perhaps 2000 feet lower than the summit of Mt. Hamilton.

Ever since the smaller telescope was put in position on the mountain, the place has attracted sight-seers. As the observatory approached completion, and the instruments were placed, the desire to see the largest telescope in the world has greatly increased the number of visitors. Tourists who come to California look forward to seeing the Lick telescope as much as they do to seeing the Yosemite valley. Tourists can go to the mountain and return to San Jose the same day, and very shortly arrangements will be made so that every Saturday night, from 7 to 10 o'clock, will be set apart for visitors.

The Regents of the University intend shortly permitting the Mt. Hamilton Stage Co. to erect a suitable "public house" a short distance from the summit of the mountain, and plans are now being prepared. It will be an artistic-looking building, capable of accommodating from 150 to 200 persons. There will then be accommodation for visitors who desire to remain on the mountain on each night as the observatory is open to the public. At present the nearest hotel is at Smith creek, some miles distant.

The exceptional excellence of the stage accommodations has much to do with the increase in number of visitors to the mountain. The Mount Hamilton Stage Company, of which F.

S. Chadbourne of this city is president, has a number of fine well built coaches made especially for this route. The coaches are the best that could be procured, and are handsome, roomy and comfortable. Exceptionally skillful

Francisco. The road is so well built and the stage equipment so exceptionally good that the old idea of a "stage ride" is done away with, and the trip to the mountain is really a pleasure drive. The luxuries of modern travel on

ON THE WAY TO MT. HAMILTON.

drivers have been employed. Horses are changed frequently so that rapid time is made. The stage line is sufficiently equipped to carry 100 passengers a day to and from the mountain. Each coach carries 11 persons.

The coaches of the Mt. Hamilton Stage Co. connect at San Jose with the trains from San

Pullman cars are paralleled on this stage line. The horses are carefully selected and the drivers are uniformed and required to be polite and attentive to patrons. People can enjoy a mountain drive without fear of danger. The stage company intend sprinkling the road during the summer months, so that the trip

will be free from dust. Not only is the view from the mountain exceptionally grand, but the scenery along the route is alone well worth the trip. The cuts on this page were made from photographs taken some months since. On page 417 is an engraving of one of the elegant new style coaches now in use by the company.

The St. James hotel at San Jose has been selected as the headquarters of the Mount Hamilton Stage Co. This, the leading hotel in San Jose, is excellent in its appointments and arrangements. It has recently been freed and refitted peculiarly with a view to the accommodation of visitors to Mt. Hamilton. Many interesting landscape paintings of a local nature may be seen at this hotel.

### Stellar Photography at Mt. Hamilton.

In 1887 the International Congress of Astronomers met at Paris and considered a scheme of international co-operation in the work of making a complete photographic map of the heavens from the north to the south pole. A plan was perfected by which a number of observatories by similar methods can obtain a series of negatives, which, taken together, will constitute a picture of the whole sky. The chief object of the deliberations was the determination of the means of making a complete survey of the whole heavens, by means of photography; and they also discussed the best methods of securing photographs of nebulae, comets, star clusters, binary stars, planets, etc. Their conclusions were formulated in resolutions, one of which reads thus: "To make a photographic chart of the sky for the present epoch, and to obtain the data for determining the position and magnitude of all the stars to the 14th magnitude." The work is of such paramount importance that, so far as possible, the Lick Observatory will join in it.

In the *Overland Monthly* for June Prof. E. S. Holden contributes an article on "Stellar Photography," in which he says:

"The whole question of making charts by photography is so recent that the Lick Trustees did not include in their plan, by my advice, the purchase of one of the 13 inch photographic telescopes recommended by the Paris conference in April, 1887. To have done so would have involved postponing the transfer of the Lick Observatory to the Regents of the University (and hence postponing the beginning of its active work) for many months, and perhaps for several years.

"Still, it is now known that this important work will be begun, and it is quite possible for the Lick Observatory to take a very active part in it, provided the necessary instruments are available, and an extra observer is forthcoming.

"If any friend of astronomy will give us \$20,000 for this purpose, I can promise for the Observatory that it will engage in this international undertaking with vigor. And I think that it is quite safe to promise that our work will be done as well as any other. I am sure that we shall be able to finish our task more quickly than other observatories, owing to the continuous clear weather of our summer and fall months.

"But the Lick trustees acting on my advice have provided a photographic attachment to the 36-inch telescope, which will enable this to be used as a gigantic camera for photography.

"It cannot be used to make maps according to the scheme of the Paris Congress, since that scheme requires a focal length of 13 feet, while ours will be 47. But we shall have a vast deal of work to be done falling under the resolution of the congress quoted.

"I have so far said nothing of the photography of the moon, of the planets, of nebulae and comets. Here the Lick telescope will have some important advantages. But it is in the photography of stars—of double and binary stars, of all the fainter stars, of all star clusters—that the Lick photographic telescope will find its chief application and demonstrate its immense superiority."

**APPARATUS FOR EXAMINING ORES.**—An apparatus for examining rocks, to determine whether they contain metallic ores, has been patented by Messrs. John R. Williamson of Seattle, Washington Territory, and Wm. W. Hickie of Oakland, California. One pole of a battery is connected with one terminal of a telephone receiver by means of a wire in the usual way, the remaining pole of the battery being connected by a conductor with a brush provided with a suitable handle, while the remaining terminal of the telephone receiver is connected by a conductor with a similar brush having a like handle. In examining rocks in place, the two brushes forming the terminals of the conductors connected with the telephone and battery are drawn along the face of the rock, while the telephone is held to the ear of operator. If the rocks contain metals they conduct the current, and the movement of the brushes along the rough face of the rock causes variations therein, which are audible through the telephone, there being no sounds produced when the rock contains no minerals. In examining detached portions of rock, the latter are placed upon a conducting plate connected with the telephone through the battery, and the brush at the other terminal is touched to the rock, which, if it contains metal or metallic ores, will cause sounds to be heard in the telephone. Instead of using the conducting plate, the fragments of rock may be examined by being placed upon insulating material, and bringing both brushes in contact with each specimen. —*Scientific American*.

## About Obtaining Patents.

### Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

### Secure a Good Patent.

An inventor should first ascertain whether or not his invention has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously patented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do not feel we can without appealing the case.

### Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

### Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 28 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications intrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

### Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the inventor to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the inventor is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional. To enable us to prepare caveat papers, we require only a sketch and description of the invention.

### Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

## MINING MEN

And the Public Generally!

AN UNPARALLELED OPPORTUNITY FOR INVESTMENT.

S. P. DORSEY, representing over three-fourths of the capital stock of the Maryland Gold Quartz Mining Company, of Grass Valley, which is divided into 500,000 shares, par value, \$20 per share, desires to dispose of a sufficient number of shares to develop this property, the value of which has been thoroughly demonstrated by the continued prosperity of the ledge, from its commencement in the Eureka, through the Idaho to the Maryland line; the product record of said mines being about \$15,000,000. The wealth of this wonderful and world-renowned ledge is shown by the latest workings in the Idaho to be as finely developed close to the Maryland line as in the richest part of its past course. Any one investing in this property, can be assured of a continued success equal to its predecessors, viz.: Yielding 25 per cent in dividends per year upon the price at which the stock is offered for sale—viz., \$2 per share. For further particulars inquire of

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

### FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, - - - 461 Howard St., San Francisco

HOOKE & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

LIFE SCHOLARSHIPS, \$75.

No VACATIONS. DAY AND EVENING SESSIONS. Ladies admitted into all Departments. Address: T. A. ROBINSON, M. A., President.

**Books on Assaying.**

By C. H. AARON.

**PART I.—Gold and Silver Ores.—Price \$1.**

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

**Table of Contents:**

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

**PARTS II AND III.**

**Lead, Copper, Tin, Mercury, etc.**  
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

**Table of Contents:**

Gold and Silver Bullion; Apparatus; Melting Bullion, Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assay; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co. Publishers, No. 252 Market St., S. F.

**HORACE D. RANLETT,****Ores, Mining, and Commission,**

420 Montgomery St., S. F.

Twenty years experience, in California, purchasing Dred and deal in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper products

## Foreign Capital in Mexican Mines.

The benefits of railways are in no country more apparent than in Mexico. The advances that have been made in that country during the past four years would make the old ones turn over in their graves could they realize it. The agricultural and commercial interests have reaped a vast benefit; the mining interests have been given a new lease of life, and we might say that the present stable state of the Government is, in a great measure, due to the advanced civilization which always follows the building of railroads in sparsely settled districts.

The principal railroad of the country, the Mexican Central, was built by American capital. It passes through a mineral country from El Paso on the north to the city of Mexico on the south, and, as a natural consequence, American capital is now largely being advanced for the purpose of developing the known mineral wealth.

The improved methods of working ores, which are rapidly supplanting the old methods, such as working lead ores with the Serpentine and silver ores by the Patio method, are making dividend-paying mines of properties which for years have been idle, as the expense of production was in many cases greater than the hullion output.

That country tributary to the Vera Cruz line, which runs from the City of Mexico to Vera Cruz on the Gulf of Mexico, has for a number of years enjoyed the benefits of English machinery for mining and milling purposes, but even here it has been found remunerative to supplant existing machinery with the more improved as it is manufactured in the United States. At the present time a plant, manufactured in San Francisco, is being erected in Pachoa, to work the tailings of the Santa Gertrudis Hacienda. The original plant of this Hacienda was brought from England and considered one of the finest in that part of the country. One of the richest and most prosperous mines in the State of Zacatecas, the Candelaria de Pinos, is, or soon will be, once more in bonanza, when the pumping machinery, introduced by a New York syndicate, is in full operation.

The properties in the State of Chihuahua, known as the Batopilas, under the management of "Boss" Shepperd, is among the largest, if not the largest, mining corporation in the world. The success of this company is due, aside from good management, to the improved American machinery with which the property is equipped. On the west coast of Mexico, American companies are rapidly absorbing all the better properties. Hardly a Pacific Mail steamer leaves this port that has not, as part of its cargo, machinery for Mexico.

The Mexican Government has seen the benefit of foreign capital in developing its mineral resources; they are constantly legislating for its benefit, though it is true that in some States the local Government still believe that a foreigner should be *cinched*, and it is but a question of a short time when mining will be as free of taxation in that country as in this.

**MINING ACCIDENT.**—On Saturday morning last, in the Consolidated Virginia shaft, Nev., a bad accident occurred. Three men were taking some timbers from the 1400 level to the 1300 station on the double decked cage. In ascending the shaft one of the timbers (12x14 inches in size) in some way slipped from the grasp of Drysdale and swung out so far that the top of it caught under a wall-plate. This brought the cage to a halt with a great jar and threw it off the guides. The sudden stopping of the cage threw Hanna off it. In falling, his feet caught between the edge of the cage and one of the wall-plates of the shaft, where he hung suspended, head downward. Drysdale was jammed between the timbers and the side of the shaft, and fell to the floor of the cage. Fitzgerald was not injured, though a good deal shaken up. It was nearly half an hour before the rescue party could reach the cage, and all this time John Hanna was hanging head downward. Drysdale was, however, much the worse hurt and may probably die.

The Coroner's jury in the case of Jim Harrington, the miner killed in a cave in the St. Lawrence mine, at Butte, M. T., found that the cave was unavoidable and could not have been foreseen, and exonerated the management from blame.

## The Advisers and Constructors.

Captain R. S. Floyd, President of the Lick Trustees, has taken the most earnest interest in the building of this observatory. He has worked early and late to perfect the arrangements. To his intelligent action in the various steps taken much of the success is due. Thomas E. Fraser, the superintendent of construction, was formerly Mr. Lick's confidential agent. To his unceasing care and ready comprehension, the Lick Trustees state, the excellences of the observatory is due in no slight degree. The Board of Trustees seconded heartily all efforts to accomplish the object as Mr. Lick would have desired.

Many astronomers interested themselves in the work and showed by personal visits or correspondence their appreciation of the importance of the undertaking. Among them were the late Dr. Henry Draper of New York; the late U. J. Le Verrier, director of the Paris Observatory; Dr. Wm. Huggins of London; Dr. David Gill, H. M. Astronomer at Cape of Good Hope; Dr. Johann Palisa of Vienna; Prof. Krueger of Kiel; Prof. Auwers of Berlin; Prof. Langley of Alleghany; Prof. Young of Princeton; Prof. Harkness of Washington; Prof. Hastings of New Haven; Prof. Ewing of Dundee. The chief astronomical advisers were Prof. Newcomb and Prof. E. S. Holden.

The glass disk for the great lens was made by Charles Feil of Paris. Alvan Clark & Sons were the makers of the lens for the 36-inch objective, and did other important work mentioned in the text of the descriptive article in this number of the PRESS. The mounting of the instrument was made by Messrs. Warner & Swasey of Cleveland, Ohio. The Clarks made the micrometer, the 12-inch and 6½-inch equatorials, the objectives belonging to the meridian circle and the collimator, the comet-seeker and the photo-heliograph. The meridian circle was made by Messrs. Repsold. The spectroscope was made by J. A. Brashear of Alleghany.

The four-inch transit and zenith telescope combined were made by Fath & Co. (objective by Clark & Son). The universal instrument is by Repsold. There are two clocks by Howden, one by Dent, one by Frodsham and one by Howard. Chronometers are by Negue & Co. The thermometric chronometer is by Frodsham & Co. Three chronographs are by the Messrs. Bond, one by Fath & Co., and one by Warner & Swasey. The electric switch-board was made by Royce & Mearns of Washington. The measuring engine was made by Stackpole & Bro., New York. The level-trier by Repsold & Sons, and spherometer by Fath & Co.

The mercurial barometers are by John Roach of this city, and H. T. Green of New York. The thermometers by Green of New York, and Roach of San Francisco. The rain and snow gauge and the self-registering barometer are Draper's. F. H. McConnell of this city, a skilled horologist, will attend to repairs, etc., on the clocks at the Observatory.

In putting up the buildings most of the work was done by day's work under supervision of the Lick trustees, and immediate supervision of Thos. E. Fraser, superintendent of construction. There were, therefore, few contracts let. The observatory house was, however, built under contract by James Treadwell of San Francisco.

The great dome was made under contract by the Union Iron Works of this city. They also made the hydraulic rams for raising the floor. The bricks for the building were made on the spot by T. W. Peterson & Co. of San Jose. The sand was brought from Smith Creek. For order of San Francisco put the metal roof on the building. Small individual contracts were made for portions of the work, but it was mainly done under order of the trustees.

THE receipts of coal at this port last week were 3050 tons coast and 2660 tons foreign, which is very light. However, there is a vast quantity of Australian coal loading for and on the way to this port. This impending influx of coal from Australia is leading importers to shade prices so as to keep their yards reasonably clear for the next four months.

LIEUTENANT BRITTON DAVIS, manager for the Corralito Company in Mexico, from which it was reported that 400,000 acres of land had been purchased for a Mormon colony, declares that the company has sold no land and intends to sell none.

## The Famous Telescope Makers.

The completion of the great 36-inch lens of the Lick telescope was the crowning feat in the life of Alvan Clark of Cambridge, the famous maker of telescopic lenses. He had attained an advanced age before commencing the work on this, the largest lens ever made, and was anxious to complete it. After repeated failures the casting was delivered to him, and his skillful hands completed the work not many months before he passed away.

His son and partner, Alvan G. Clark, who assisted him in his work, and continues his business, visited Mount Hamilton last January. He was greatly pleased with the clearness of the atmosphere there, and the facility offered for astronomical research. He has visited most of the noted observatories, and is of the opinion that this possesses advantages which no other has—the largest telescopes and the clearest atmosphere. He is confident that with the very efficient corps of observers and complete outfit of instruments, the Lick Observatory will bring fame to California. In conversation with him shortly after his visit to the mountain, he stated to the editor of the PRESS that he never saw a place where there were such good nights for astronomical observation. Even from his little experience there, he is of the opinion that the location is an admirable one—wonderfully good.

At that time he said that, if finished as proposed, all the appliances would be of the very best. The atmosphere exceeds that of any place he had ever seen for observing purposes. Some of the nights there, which those familiar with the locality did not call very good, he considered first class, as compared with other places.

Mr. Clark was pleased to find so much interest in astronomical work in California. He has, he says, a desire to build a little larger telescope than the Lick. He is more certain of the advantage of large glasses than he had been. Better material can now be procured than formerly. He is of opinion that the limit of size has not yet been reached in refracting telescopes. A young Frenchman, Edward Mantoir, successor of Fiel & Mantoir, shows great skill in producing the optical glass. He has very fine appliances and an enlarged establishment for the purpose.

Another 36 inch glass could now be made much more easily than when the Lick lens was commenced. Mr. Clark thinks a 40-inch could be made as easily as the 36-inch one. He has a strong desire to "beat their own record," although he is perfectly satisfied with this lens "as far as it goes." He now has no fear of

## Meeting of the Academy of Sciences.

The academy held a very interesting session at its regular meeting on Monday evening last. The occasion was an informal reception to Prof. Frank Cushing, who has become quite famous by his explorations and researches into the habits, customs and remains of the ancient Zuni Indians. These researches have been conducted in Arizona, and have already resulted in a very large and interesting collection of remains which throw much light on the habits and customs of this remarkable people, and prove that they had reached a very great degree of skill in many of the arts more than a thousand years ago, particularly in agriculture and architecture. Extensive remains of buried cities have been brought to light, one of which covers an area of fully three miles in length by a half a mile in width, built upon the banks of what must have been a very large and extensive canal designed for both irrigation and commercial purposes.

Professor Cushing visited the academy under special instructions from his physicians not to make any special effort at a lecture; but notwithstanding such instructions he made a brief opening address, and then taking his seat, expressed his willingness to answer any questions which might be asked in regard to his explorations.

Many questions were put to him, and the large and appreciative audience present were much interested and instructed by his answers. The crowded state of our columns this week will not admit of any extended report of his remarks; but we hope to be able to give quite a full report of the same in our next issue.

The professor will probably spend some little time in this city, and it is hoped will be able to be present at the next meeting of the academy, and give still further information in regard to his explorations and discoveries. He announced that quite a number of valuable specimens were now on their way to this city to be presented to the academy.

Among the donations received for the evening were 84 birds, obtained by Walter E. Bryant in California, Oregon, Nevada and Lower California, and prepared by him, and a coyote from R. E. Rowland.

It was also announced that within a month the trustees of the academy will begin building on the Market-street lot left by James Lick. The edifice will cost about \$200,000.

MT. HAMILTON STAGES.—On this page is given an engraving of one of the coaches of the Mt. Hamilton Stage Co., running between San

COACH OF THE MT. HAMILTON STAGE COMPANY.

"flexure" in a large lens, experience having shown that fears in this direction were groundless.

SAVAGE SON & CO.—This well-known firm of foundrymen made an assignment this week. Richard Savage, when asked the cause of the failure said: "The assignment is due to the efforts made by the firm to do more business than our capital would warrant. During the last few years we have put several new irons into the fire, which have not turned out as profitably as we supposed they would. To lengthen the enterprises we borrowed large sums of money, principally from the Nevada banks, which we have been unable to repay." The firm employed about 200 men. The contracts on which they are at work will be finished, and whether they will resume again depends on the creditors. There is not much unfinished work on hand.

Jose and Mt. Hamilton, taking visitors to and from the observatory. The stages were specially built for this route and are strongly built and roomy. Those who have used them speak of the coaches as exceptionally "easy riding."

THE building of the Cogswell Polytechnic college, Twenty-sixth and Folio streets, is almost completed. The first session for the reception of students will be held on Monday, Aug. 6th.

THE Santa Paula Chronicle reports the shipment of 184 tank cars of oil from that place during the month of May, the largest shipment ever made in one month.

JOHN ROSS has resigned as superintendent of the Winnemucca Mining Co., to accept a position at the Lang Syne mine at Dun Glen.

A DESTRUCTIVE fire occurred at Kingman, A. T., on Sunday. Loss, \$50,000.

WM. H. TAYLOR, President.

R. S. MOORE, Superintendent.

## HEINE SAFETY WATER TUBE BOILER.

Has the Following Advantages:  
**SAFETY,  
DURABILITY,  
ECONOMY,**  
AND FACILITY OF INSPECTION and REPAIRS.  
60,000 Horse Power now in use.

Boilers can be seen working in San Francisco at Palace Hotel, Spring Valley Water Works, Hueter Bros. &amp; Co., California Jute Mills, and other places.

Guaranteed More Efficient than any other Boiler made.

**QUARTZ MILLS**—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.  
**AIR COMPRESSORS**—Rope Power Transmission.  
**HYDRAULIC PUMPING** and Hoisting Machinery.  
**WROUGHT-IRON WATER PIPE** a Specialty. **NOTE**—Have just completed order for 35 miles of 44-inch pipe of 4-inch iron for Spring Valley Water Works Company, San Francisco.  
**SAW-MILL MACHINERY** of all kinds.  
**STEAM ENGINES**—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.  
**SOLE MANUFACTURERS** for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 60,000 horse power now in use.  
**MACBETH PATENT STEEL-RIM PULLEYS**—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

**BUILDERS OF**  
**REFRIGERATING MACHINERY** for Steamships, Breweries, and Cellars.  
**WILSON'S PATENT GAS-PRODUCER.**  
**STEAM BOILERS** of all descriptions.  
**SUGAR MACHINERY**—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.  
**STEAMSHIPS**—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.  
**Builders of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 60-stamp Mill for Quartz Mountain Mining Company.**  
Send for Circular and Price Lists.

## NOTICE TO GOLD MINERS! SILVER-PLATED AMALGAMATED PLATES For SAVING GOLD!

Sectional View of Pulverizer.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

### POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon sulphurets and ores containing rusty gold. The light weight and simplicity of construction of the pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

## NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ &amp; CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

MARSHUTZ &amp; CANTRELL

Send for Circulars and Price List.

## THE RAND DRILL COMPANY,

23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40-inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in the field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

### WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and  
high heads are utilized, and are guaranteed to give more power with less water than  
any other wheel made. Being placed on horizontal shaft, the power is transmitted  
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in  
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the  
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,  
by applying to the manufacturers.

American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

**FRUIT-STONING MACHINES.**—Benjamin A. Little, S. F. No. 384,371. Dated June 12, 1888. This is one of the class of machines for stoning fruit, and is especially adapted for the larger and flesh clinging fruit, such as cling-stone peaches, etc. The invention consists in the novel jutting and gripping knives, their peculiar arrangement, and the mechanism by which they are operated; in the scrapers on which the fruit rests and their novel arrangement and operation.

**AUTOMATIC SAMPLING APPARATUS.**—Allen Bradford, Wardner, Idaho, assignor of one-half to Victor M. Clement. No. 384,420. Dated June 12, 1888. This apparatus is intended for sampling the pulp or tailings of quartz-mills. It consists of an improved vibratory sampling-cup arranged to traverse the stream of pulp or tailings, whereby a portion of said stream is directed away from its general course into a suitable receptacle. There is a pivoted swinging frame which carries the sampling cup, having a cross-head on each end of what is a self-discharging vessel for water. A tilting tank is adapted to receive water on each end alternately, and to discharge it into the vessels of the swinging frame, whereby the movement of the frame is made automatic. This apparatus is complete in itself and automatic in all its workings, being absolutely accurate in the sample taken, and capable of being regulated to any degree of speed so as to obtain any size of sample, the sample being ready, at any period of the run for the assayer. It is adapted to any class of pulp and can be placed in any part of the mill where a periodical sample is desired.

Mining Share Market.

The stock market still continues dull and unattractive. The recent advance in prices is not by any means sustained. Meantime the Comstock mines are turning out more bullion than ever. During May the Chollar mine worked 1500 tons of ore, yielding bullion to the assay value of \$24,551.60. The cost of reducing was \$10,500, and the net proceeds in bullion were valued at \$14,051.60. The average assay value of the ore per ton was \$21.73, and the gross average per ton in bullion was \$16.36. The net average per ton was \$9.36.

The official statement of the ore worked and bullion produced for account of the Consolidated California and Virginia mine during the month of May is as follows: There was worked at the Morgan mill 5240 tons of ore yielding bullion valued at \$150,111.41, of which \$71,012.62 was gold and \$79,098.79 was silver. The yield in bullion per ton was \$28.64, and the average assay value of the battery samples was \$35.91 per ton. There was worked at the Eureka mill 3300 tons of ore yielding bullion valued at \$261,061.72, of which \$120,689.21 was gold and \$140,372.51 was silver. The average yield in bullion per ton was \$31.45 and the average assay value of the battery samples was \$36.12 per ton. There was worked at both mills a total of \$13,540 tons of ore, yielding bullion valued at \$411,173.13, of which \$191,701.83 was gold and \$219,471.30 was silver. The yield in bullion per ton of ore was \$30.36 and the average assay value of the ore per ton was \$36.04. Attention is directed to the unusually large amount of gold contained in the bullion produced last month, which affects a great saving to the company on account of the heavy discount on silver.

The ore-producing sections of all the leading Comstock mines are looking and yielding well.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, June 16, \$65,431; Confidence, 15, \$16,067; Hale and Norcross (for May) \$141,921; Hanauer, 12, \$27,000; Crescent, 12, \$33,500; Queen of the Hills, 12, \$85,000; Hanauer, 12, \$22,225; Germania, 13, \$39,900; Richmond Con., 15, \$14,925; Eureka Con., 15, \$20,600; Germania, 14, \$16,999; Hanauer, 14, \$15,500; Queen of the Hills, 14, \$10,000; Argus, 15, \$13,271; Hanauer, 15, \$18,000; Germania, 16, \$15,555; Hanauer, 16, \$22,000; Crescent, 16, \$4,500; Chollar, 17, \$33,334; Confidence, 16, \$18,694; North Belle Isle, 20, \$26,000.

AN Eastern manufacturer is visiting Marysville, and is seriously thinking of building a cotton factory there. He says cotton can be shipped at a less expense from Texas to California than it can from North Carolina to Massachusetts.

GENERAL SHERIDAN continues to improve in health.

A STANDARD WORK.

This practical work of 233 pages gives with full illustrations and complete detail how to build or repair all kinds of mill dams. Plans have been taken in thoroughly illustrate dam construction and rudimentary hydraulics. It contains fine cuts of all the well-known dams now in use, with a complete description as to their mode of construction. Mill owners will find this a valuable work of reference. Besides complete directions for building and repairing all kinds of dams, it contains much other valuable information regarding hydraulics, in all its branches. No engineer can afford to be without this handy pocket assistant.

**FOR SALE.**

A half interest in a gold bearing quartz mine, situated at Mokelumne Hill, Calaveras County. Two shafts sunk 60 and 110 feet, respectively; also a level run at the bottom of the 110 foot shaft about 100 feet. The ore body averaged three feet strong, and varied from \$10 to \$20 per ton. A tunnel was since run 300 feet, and a ledge has been struck which is four feet in width. This ore will yield \$5 to \$6 per ton. It is only sixty feet from the surface. The object of selling the above-named interest is to obtain some responsible party, with means, to sink a shaft 300 feet, and run several drifts along the ledge. The present owners ceased operations for want of working capital. None but principals need apply. The party purchasing must commence operations within thirty days from date of signing contract and work continuously and systematically till the shaft is completed. It is patented property. Address,

ABRAM SHEAR,  
 No. 506 Battery St., San Francisco, Cal.

**MINES WANTED.**

Advertiser wishes to bond good mines for the foreign market. Those in active production preferred. Time required. Address,

### GREAT REDUCTION! BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates. I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

### PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses. Inventor and Manufacturer of the celebrated Slot-Cut burr and Slot Punched Screens. Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

**San Francisco Pioneer Screen Works,  
21 & 223 First St., San Francisco, Cal.  
JOHN W. QUICK, Proprietor.**

### THE PELTON WATER WHEEL

Gives the highest efficiency of any Wheel in the world and is everywhere recognized as the standard for high pressure service.

UPWARDS OF 500 IN USE.

From 12 to 20 per cent better results guaranteed than can be produced from any other Wheel in the country. It is not only most economical of water, but the most ample and reliable power for Quartz Mills, Hoisting, Pumping, or any other purpose where water power can be used.

### ELECTRICAL TRANSMISSION.

Power from these Wheels can be transmitted by electricity several miles with small loss, and made available for running Mills, Pumping and Hoisting Works, Tram cars, etc. Address

**The Pelton Water Wheel Co.,  
127 FIRST ST., SAN FRANCISCO, CAL.**

### QUARTZ SCREENS

A specialty. Round, slot or burr slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

2 Triumph Concentrators.

1 New 12-inch, 35 H. P. Engine.

VERY CHEAP. Apply

130 Sansome St., room 12.

# \$1,000 CHALLENGE!

**THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.**

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave each satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

**ADAMS & CARTER, Agents Frue Vanning Machine Co.,  
Room 7, No. 109 California Street, SAN FRANCISCO, CAL.**

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, hearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

**JOSHUA HENDY MACHINE WORKS,  
Nos. 39 to 51 Fremont St., San Francisco, Cal.**

1850. BUILDERS OF 1888.

**MINING MACHINERY.**

GENERAL OFFICE AND WORKS:

New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ore and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

# The Pelton Water Wheel

Gives the highest efficiency of any Wheel made, and is the standard for high pressure service in all parts of the world. Over Five Hundred are in use on the Pacific Coast alone, running Quartz Mills, Hoisting and Pumping Works, Electric Plants for power and light, as well as for various manufacturing purposes.

They are adapted to any head of water from 20 feet up to 2000 feet. These Wheels are now coming largely into use in connection with Electrical Transmission, furnishing power which is carried long distances with but small loss.

Address:

**THE PELTON WATER WHEEL CO.,  
127 First Street, San Francisco, Cal., U. S. A.**

A. P. BRAYTON, JR., General Manager.

L. A. PELTON, Consulting Engineer.

## ATTENTION, GOLD MINERS!

WE ARE SELLING

## Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,**

E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

# PALM VALLEY!

## Tropical Wonderland!

Scenes on and near the property of the Palm Valley  
Land Co., San Diego County, Cal.

**EARLIEST FRUIT LAND IN THE WORLD!**  
**EARLIEST VEGETABLE LAND IN THE WORLD!**  
**FINEST WINTER CLIMATE IN THE WORLD!**

DO YOU WANT to buy a fine tract of land at a low figure, that will double in value in three months, and that will produce a crop in six months that will more than pay for the land?

DO YOU WANT a tract of land that will produce ripe grapes six weeks in advance of any other section of California now cultivated?

DO YOU WANT a tract of land that will raise watermelons that will ripen seven weeks earlier than they will in any other section in the State, and that will sell for a dollar apiece in Los Angeles, Riverside, San Diego, San Bernardino, San Francisco, or any other Pacific Coast town or city?

DO YOU WANT a tract of land where there is practically no frost?

DO YOU WANT a tract of land where no hard wind strong enough to blow fruit from the trees is ever known?

DO YOU WANT a portion of the tropical valley of the State?

DO YOU WANT to quadruple your money on short notice? There is a chance for you to do it.

THE PALM VALLEY LAND CO. has secured 2000 acres of this choice land; has subdivided it into 5 and 10-acre lots, which they are now selling at \$200 per acre, with a PERPETUAL WATER RIGHT, sufficient to irrigate the land.

The lands were placed on the market with the announcement that as soon as each hundred acres were sold, the price would be advanced \$25 per acre, and that this rule would be followed up to the selling of 500 acres. Two hundred acres have now been sold on this basis, starting at \$150 per acre. The price is now \$200 per acre.

The Company has a Stone-walled Irrigating Canal, Over Ten Miles in Length, Completed.

They have completed a railroad from Seven Palms, a station on the main line of the Southern Pacific Railroad, to PALMDALE, the townsite owned by the Company.

They are planting 160 acres to an Orange Grove, of Navel Oranges, and many other improvements are now in progress, that will make this one of the most attractive Colonies in the State.

No safer place for the investment of capital, and no more delightful place to live in the winter can be found.

PALM VALLEY is sure to become the greatest sanitarium in the world.

**THERE IS NO FROST, NO FOG, NO HARD WINDS.**

There is here all that can be desired to make Palm Valley one of the most attractive places in Sunny Southland. Maps, circulars and further information by calling on or addressing

## Importation of Lead Ores.

The investigations called for by Senator Stewart of Nevada in regard to the importation of lead ores through the Custom-house at El Paso, Texas, is a move in the right direction. If the Mexican mine-owners find that they can ship the products of their mines to the United States for reduction, and thereby realize a greater profit, it stands to reason that they will do so; but, while the Mexican miners gain a profit, it is at the expense of the miners in the United States. The smelting works require a certain quantity of ore per annum to keep them in full blast, and as their profit comes from the amount charged per ton for smelting, it is immaterial to them whether the ores on which they run come from the United States or Mexico.

In importing ores they are properly classified as gold, silver, lead, etc., according to the predominating value of the metal they contain; it is just here where the shoe pinches. Most of the ores imported through the El Paso Custom house are literally gold and silver ores, but as a rule they contain lead, often to such an extent that they practically become smelting ores.

These ores are imported as gold or silver ores, as the case may be, no account whatever being taken of the lead they contain. It will readily be seen that it is very much to the advantage of the smelter to import the rich ores of Mexico. When they contain from 10 to 15 per cent of lead, the high value of the gold or silver in the ore brings the lead in free of duty. The lead helps the smelter out with his problem, but once it comes into the market it is there at the expense of the lead-producing mines of the United States.

It would be far more just to enter an ore, giving the per cent or value of its constituent metals and on these values assess the duty and not as at present class the ore according to the metal of greatest commercial value contained in it.

The smelter must have a certain amount of lead in order to conduct his operations; under the present construction of the law smelters who draw a supply from Mexico get the necessary article much cheaper than their competitors who are compelled to purchase lead ores mined in the United States.

The cost per ton of producing ores is generally higher in the United States than in Mexico. The latter country can produce unlimited quantities of lead ores, carrying silver and often gold. With the present facilities for transporting ores from Mexico to the United States it is only a question of time, unless some means are employed to make the Mexican flux (the lead ores imported should be considered more in the light of a flux than an ore to be worked for its contained lead) cost as much as the same article produced in the United States.

Senator Stewart thoroughly understands the situation of mining in the United States. This

is appreciated by his fellow Statesmen, and it is safe to say that any measures he may introduce into the Senate looking to the advancement of mining interests in the United States will be carried through.

DESSICATED HUMAN REMAINS.—Bulletin No. 1 of the California State Mining Bureau gives a

LONG MILL RUN.—The North Bell Isle mine, Nev., made a mill run during the past year which covers a period of 251 days, of which the actual running time was 241 days, showing a loss of 10 days, occasioned by such stoppages as are incidental to a prolonged mill run. Three thousand and fifteen and sixty-hundredth tons of ore were milled with 10 stamps, showing an

## William's Superheating Smelting Furnaces.

The accompanying engravings are an elevation and section through one of William's improved smelting furnaces, arranged for copper smelting.

These furnaces are in many respects a departure from ordinary practice, and give very desirable results especially as to fuel economy. The furnace proper is of the water-jacket type, the water extending all the way to the bottom as shown in Fig. 2.

Above the water-jacket is placed a superheater (A) exposed to the hot gasses inside and connected to the tuyeres by six dam pipes as shown. Air is forced in at the large nozzle seen in Fig. 1, and before reaching the tuyeres is raised to a temperature of from 300 to 500 degrees, the process being the same in principle as that employed in smelting iron.

The saving in fuel thus affected is two per cent for each 100 degrees of heat added to the air and amounts in all to from 6 to 10 per cent, a very important item in the cost of smelting, especially at present prices of fuel. Another novel feature of these furnaces is the adjustable bottom plate, arranged as seen in the section. This can be raised or lowered to suit the nature of the ore being worked or other requirements, and can easily be removed entirely so as to substitute a lead-smelting bottom.

This latter is not shown in the drawings but forms a part of the system, the change being only in substituting a lead well siphon and other required apparatus for the "copper bottom."

The furnace is not mounted on a flat plate in the usual manner, but is supported on four legs or pillars made of wrought iron pipe, screwed into brackets, riveted to the outer shell as shown. In transporting the furnaces, these legs, the bottom frame, spouts, and so on, are removed to avoid weight in handling.

The tuyere boxes are arranged with closing slides so the blast can be shut off from any one in case of clogging.

The means of water circulation and many other features of the furnaces are similar to common practice. They are made of the usual dimensions, for copper, lead, or other ores. They are constructed by W. T. Garratt & Co., of this city.

OUR coast collieries sent us last week 30,616 tons of coal, and 10,017 tons of foreign coal came to this port. The coast collieries are sending along their full quota, and present quotations leave them a very handsome profit, and the disengaged tonnage here at present enables them to secure favorable freight rates.

THE mine owned by Messrs. Tryon, McCreeght and Hardy, a mile from Carson Hill, Calaveras county, has been sold to San Francisco parties for the magnificent sum of \$100,000. For over six months this mine has been yielding from \$5000 to \$10,000 per month.

WILLIAM'S IMPROVED SUPERHEATING SMELTING FURNACES.

description of the dessicated human remains from the Sierra Madre mountains in Mexico. The mummies were purchased by J. Z. Davis and presented to the Bureau, and the pamphlet was written by Dr. Winslow Anderson of this city. Artotypes accompany the report. The descriptive matter is of interest to ethnologists. At the same time we should have preferred to see Bulletin No. 1 of the California State Mining Bureau with some such title as this: "Results of Milling Gold Ores in California." When such subjects as this are thoroughly treated, it will be time enough for the California Mining Bureau to tell us about the ethnology of Mexican races. It may be said, however, that the Bureau is now collecting data about gold mines, and in due time the results will be printed.

average crushing of 12½ tons per day. The average battery pulp assay was \$214.64 per ton. The net assay value of the million produced was \$564,955.09. The results of this mill run have been very satisfactory when the condition of the mill, the lack of many of the improved appliances of the present day and the rebellious character of the ore are considered (containing as it does 30 per cent iron pyrites, 4 to 6 per cent zinc sulphide, antimony and arsenic sulphides, and other bases). Much credit is due to the mill superintendent, E. L. McMahan, for the working results attained, and it also demonstrates the fact that ores of this district, of however rebellious a nature, can be worked to a very high per cent if the desulphurizing and chloridising facilities are adequate.

## CORRESPONDENCE.

We admit, unadorned, opinions of correspondents. — EDS.

## Mining Debris.

## The Possibility of Impounding It.

EDITORS PRESS:—The decision of Judge Sawyer, in what is known as the Debris question, which has injured more people than any other decision of any court in the United States if not in the world, during this century, and has, to use a common phrase, wiped out more millions in value of productive property, has been the result of the submission of the most important question to one man, or rather has been the result of the mode of taking testimony before commissioners, so called, who were simple stenographers, appointed to take testimony only. This was done without regard to any ruling upon any question by the judge until it reached (so we are credibly informed) 12,000 pages of all sorts of talk. The judge never saw or heard a witness in the case, refused to hear the testimony read, and never read it himself, but heard long arguments of lawyers, and finally decided the celebrated case of Woodruff vs. the North Bloomfield Gravel Mining Co. et al., without really knowing much about it. Woodruff professed to be a citizen of New York, but before the suit and after it was a citizen of Yuba county, owning land on both sides of the Feather river below Marysville, and some property in Marysville, and therefore had a status in Judge Sawyer's court. Under the orders of this judge, all sorts of loose statements of numerous witnesses were admitted, over one-fourth of which would not have been admitted in any open court, and while it is well known that the plaintiff was not damaged one dollar, yet the judge allowed testimony of a very loose character and acted upon it to prove not only that Mr. Woodruff might some time or other be injured, but extended the scope of the testimony from the Pacific ocean to the head of the Sacramento and San Joaquin rivers, and finally decided, aided by a U. S. district judge brought from Oregon (although there was one here familiar with our State and its laws and customs from the time it became a State), that Mr. Woodruff was so much damaged and was in such great danger of injury that every hydraulic mine in California, and for that matter almost every other mine also must be closed, and that by no possibility could any preventive measures be taken by which the largest gold-producing industry in our State or in the world could continue.

It would be too long a story to recapitulate the serious results of this decision, or of the statements connected with it, or of the practical results of the decision, or of the injury to the miners or want of benefit to any other persons except perhaps to the few whom the miners styled the "anti-debris ring."

The injury is however complete, the hydraulic mines are closed, and almost every other mine can be closed on same ruling. The immense works constructed by the miners are of no value, and fast going to ruin, and no one is in any way benefited. And although the miners have repeatedly stated their ability and willingness to so use their mines as not to commit any real injury, by constructing impounding works, yet our Supreme Judges say no, it is not possible to do it. And this vast industry, which turned out some \$15,000,000 of gold per year, kept many thousands of operators busy, which has turned into the commercial channels of the world some 1200 millions, must forever remain closed, simply because this judge believes, or says he does, that our engineers who can do almost anything, are not able in his opinion to construct works to safely impound debris, although upon our own peninsula and across the bay, one of them is now constructing for a private corporation (the Spring Valley Water Co.) two dams to impound water, either of which are by far much more expensive and important than would be the case to impound all the debris upon any single mining stream in this State.

We have always believed that if one of our engineers, Mr. Schnessler, can impound water by building dams 175 feet high, that there were others who could build dams to impound dirt or debris of equal or greater height; and in this view we are glad to say all the engineers in this State or in the United States concur. But our sapient and wise U. S. judge says in his superior engineering knowledge that it cannot be done, and so this vast industry is extinguished.

We are led to make these preliminary remarks simply because it has quite recently come to our knowledge, through a lawent recently tried in Butte county before Hon. L. D. Freer, wherein it has been shown beyond contradiction that debris can be impounded with entire safety, that it is not such a terrible thing to encounter as our U. S. judge would have us believe. Believing, as we do, that it is certainly within the power of our civil engineers to do it, we now lay before the public a statement showing what one hydraulic mining company is now doing, and also as showing what can be done with mining debris from hydraulic mines.

In Yuba county a mining company called the Spring Valley Gold Co. is operating a hydraulic mine upon a large scale, and, as its predecessor, has done so for many years past, with little or no injury to any one.

Its large mine, which turns out about one-

fourth of a million of dollars every year, is worked by means of 2200 miners' inches of water brought to it from its head reservoir, some 35 or 40 miles across a branch of Feather river in a pipe under 800 feet pressure at its lowest power, and finally used in the mine under 250 feet pressure, using about 700,000 miners' inches of water per year, mining out about 1,500,000 cubic feet of material per year. The material from the mine, after leaving it, passes down a steep ravine or canyon for some two or three miles, until it reaches an open place for depositing debris.

There a large percentage is lodged. After passing this place the water still heavy laden passes to a debris reservoir made by means of a dam called the Lyford dam, and from this it passes into a canal some 20 miles long, which debouches into the Tule basin at mouth of Butte creek. The plain facts brought out by this lawsuit, in evidence given by engineers of the best standing in our State, show that of all the material mined out in this large mine, about ten per cent remains in the mine in the shape of large boulders and coarse material, some 40 to 50 per cent remains in the canyon, and at its foot, of course, gravel, stones and heavy stuff. Some 30 to 40 per cent then lodges behind the Lyford dam, and from five to ten per cent only passes below this dam in shape of silt in suspension, which would find its final rest in the Tule basin, below mouth of canal, if it was not turned out and utilized on its way. The Lyford dam is built of willow-brush; it is now nearly 30 feet high and one-half mile long, and is a live dam. As the willows grow on its lower face, it is a mass of live willows. When it is carried up some 20 or 25 feet more, it will cover with fine sandy debris two square miles, requiring 2,000,000 cubic yards to raise it one foot, and by the time the dam is filled to its contemplated maximum height, the mine will be exhausted. The canal, from the dam to its mouth, is, in its narrowest place, 400 feet wide, built upon the surface of the ground with levees or embankments varying in height from 6 to 8 feet. The levees were originally constructed some 12 years since from the soil of the country, a black adobe, which is the very worst material for such purpose, and for many years great trouble was caused during the rainy season by the breakage of these levees until a system of what is called "sub-levees" was introduced, which can be described as follows: Some 30 or 40 feet or more outside of each main levee, and sometimes inside, another levee was thrown up, and the space between these two has been filled with slickens from the mine, including not only the 10 per cent which passed from the dam in suspension, but other material which was allowed to pass from it also; so that the levees are now considered impregnable as against danger from flood waters. The drainage of about 90 square miles of country flows into this canal, amounting during flood time to about 500,000,000 cubic feet of water per day, while the carrying capacity of the canal is 500,000,000 cubic feet per day up to within a foot of the top of the levees. This so-called slickens, which fills the space between the main and sub-levees, is the best material known for levee purposes, as it packs in between the two very solid, does not crack, and the rodents do not penetrate it far. This canal, which is one of the largest, if not the largest, in this country, being 400 feet wide at its narrowest place and one-half mile at its widest, has a minimum grade of about two feet only per mile, and in high water has a velocity of some three and a half miles per hour, and if the company would permit the material impounded to pass from the Lyford dam, would transport a large quantity through its entire length in flood time and eventually fill the Tule basin below if there was enough of it in the mine, making excellent land of it, instead of being as now a waste of no value.

The company, however, desires to retain the material in the Lyford reservoir, as by the time the mine is exhausted, it will contain some 2½ square miles of the finest soil in the State, worth a large amount of money. The flood water of Dry creek, which now passes over the dam every rainy season, to from 300 to 500 million cubic feet per day, can easily be carried after reservoir is filled around this debris reservoir and turned into the canal below. This debris dam shows practically to the merest novice that our wise Judge must be mistaken in his judicial engineering knowledge, when he says that a debris dam cannot be made to resist the pressure against it in the many rivers, for if there was water behind this dam, now nearly 30 feet high, it would not stand a minute; but as it is simply earth behind it, there is not now, nor will there ever be, any giving out or down stream movement. It is raised now about an average of one foot per year, and it is as staunch and firm as when it was first commenced several years ago, and, in fact, is stronger. These years of practical work upon a large scale show what can be done with debris if brains, and not judicial lore is brought to bear upon the simple problem of impounding earth. It shows that at least 90 per cent, perhaps 95 per cent of debris from hydraulic mines can be impounded and stopped in place, also that the balance, which may be carried in suspension (but even that percentage would depend upon the length of the reservoir behind the dam) can be carried many miles upon a very light grade to any place of final deposit in the Tule basin that may be desirable. For many years this company permitted the farmers owning land adjoining the canal to turn the debris laden water out of the canal upon

their lands (this was before the Lyford dam was constructed and before the inauguration of the system of "sub-levees") for filling up of depressions, until many hundred acres were so filled, which are now the best land in that section of country.

This material which then passed down the canal was much greater in volume than now, as it then amounted to probably 30 or 40 per cent of all mined out, but it now only consists of the finest silt.

If one 10,000 or 15,000 acres of waste land in the Butte creek basin, below the mouth of this canal could be filled with this 30 or 40 per cent, it would certainly be of great benefit and value to the land owners, and the State at large, as what is now a resort for wild fowl would then be a garden spot. That this same result can be arrived at in filling the Sutter basin and the American basin of thousands of acres of now valueless lands with debris from the mines is quite certain. For if debris dams were to be built across the American, the Bear and Yuba rivers so as to raise their beds to a height sufficient to give fall enough to carry the water and silt, or even the heavier material into these basins and eventually fill them, i. e., if there is material enough in the hydraulic mines to do it, the result would certainly be most beneficial to all interests.

What is being done by this one company in transporting debris 30 miles to a final resting place in the Tule, can certainly be done upon a much larger scale upon the rivers named, for in none of them would the difficulty be any greater than is the case with the Spring Valley Gold Co., although it might and would cost a little more money to do it. Suppose, for instance, that a debris dam was constructed across the American river at some convenient suitable point 100 feet high or more. It would simply have the effect to raise the river-bottom that high, giving fall sufficient to carry the mining water (laden with such debris as must pass along the bottom and in suspension) into the American basin. This water would drop its load when it reached there, and after the basin was filled with water it would flow back again into the river nearly or quite clear. The same may be said of each mining river; but so long as our wise judges say debris-impounding dams cannot be maintained in these rivers so long nothing will be done. Stupidity is a fearful obstacle to progress. One of our wise United States judges said from the bench in the Woodruff suit: "If one of these proposed debris dams should, after being built, give way, there is no telling what the consequences would be"—closing this sapient statement by saying, "No one should be obliged to live under such a glacier."

An example and result of this terrible danger was given about 18 months ago in the Lyford dam when from carelessness in the men carrying up the dam, the water, some 500,000,000 cubic feet per day, then passing from Dry creek, was allowed to cut its way through the dam to the bottom, with the fearful result that it simply cut a narrow channel some 300 feet long back from the dam into the reservoir, and some 30 or 40 feet wide at the dam through it, which was repaired a few days afterwards, and no one below was any wiser, or knew anything about it. Had that dam been a water dam impounding water, it would all have gone out. But 500,000,000 cubic feet of impacted earth does not all move at once, or in a brief time as would be the case with impounded water. When the dam at the so-called English reservoir was blown up in June, 1883, over 600,000,000 cubic feet of water went out in an hour. Had it been 600,000,000 cubic feet of debris, it would be there yet.

We invite attention to the operation of the S. V. G. Co., also the results of the debris impounding and transporting arrangements, and we do not hesitate to say that any intelligent person, except perhaps a United States judge, must come to the conclusion that what is being done there, and has been done for a long time past can be done elsewhere, and that so far as impounding mining debris and transporting it to where it will become useful and keeping it out of the mines is concerned, as well as making good land out of waste places with it, the result of the operations of the S. V. Gold Co. show it can certainly be done.

Should the Biggs bill, now before Congress, become a law, which we sincerely trust will be the case, there is little doubt but the engineers who may be appointed to make an exhaustive examination of this debris question will report that "debris dams" can be built and maintained in the mines, although our United States judges say that they cannot. L.

LOS BURROS GOLD MINES.—The San Jose Times has seen a private letter written from the gold mines on the coast of Monterey county to a resident of San Jose. The belief of old miners there is that there will be a number of paying mines in that district. Several have been proved; the Cruikshank mine is paying nicely, rich ore being taken out constantly from a four foot ledge. Another, the Manchester mine, is considered valuable, with a 16 inch ledge showing free gold all through. Good judges think it will be worth \$250 to \$300 per ton. The Ophir, Ajax and other claims have excellent prospects. There is quite a mining settlement in that district. It is reached from the railway stations south of Soledad to San Miguel, through the San Antonio valley and the hamlet of Jolon over a good trail. The average distance from railroad points is about 45 miles.

## Placer County Mines.

EDITORS PRESS:—It is surprising to the mining man who visits Placer county that so little development is going on in a field so rich and promising. Gold-bearing quartz ledges traverse this section in every direction, ledges that with proper development would become paying propositions; but for reasons that will be dealt with further on, are undisturbed, and it is a question at the present time whether the wealth thus locked up will ever flow through the channels of trade.

In days gone by more or less work was performed by poor men on many of the veins to be found in this district, but the cost of machinery at that time was greater than they could stand or the showing would justify. The consequence was that abandonment followed simply because what were then termed "poor grade propositions" could not be worked profitably. Radical changes have taken place since that time, and mines that were non-paying then can be worked profitably to-day. Mining machinery, simple in its character and much cheaper in its construction has been invented, wages are much lower, and transportation rates so reduced that even the poorest grade mines will guarantee a respectable margin over the cost of extracting and milling of the ore. A harrier however exists to-day, one that cannot be broken down by the impetuous prospector, and in coming to Placer county, or at least in many portions of it, to ply his vocation, he finds himself baffled on every hand by agricultural patents that have been plastered over our mineral fields.

How these patents were obtained is a question that those who applied for them and the grantors can answer much more readily than your correspondent. This county is a recognized mineral district, and mining is still going on, and though not now regarded as a leading industry, would soon become active again, and millions of dollars would be taken from the ledges and river channels that are everywhere to be found but for the fact that an agricultural patent covers mineral ground. In nine cases out of ten the working of the mineral land would not interfere a particle with the tilling of the productive lands by which they are surrounded, but there seems to be a bitter feeling among those engaged in agricultural pursuits against the man who mines. They will not work ledges known to exist within their boundary lines and will not permit others to prospect them cognizant of the fact that such work would not interfere with the cultivation of the soil or damage it a particle. Many men who owe their success to the mines have turned their backs upon the industry that laid for them the golden egg, and in some instances have obtained agricultural patents on land that they knew was mineral land, and there is but one way that they could have done so, and that was by perjury or fraud of some description. It is high time that some inquiry was made into this matter and the nefarious practice stopped. If mining men possessed of capital were operating in this county, there is no question but what many such questionable patents would be annulled, but as it is, those who would act in the matter have not the means to bring such a contest to a successful issue. Mining in this portion of our State is receiving more attention than for some years past, and a general revival all along the line is predicted. In the immediate vicinity of Newcastle a ten-stamp mill will be erected this season by the Valentine Bros., on the Hathaway mine, and adjoining properties will also receive their quota of work.

At Ophir more or less prospecting is being done, and it is reported that several good pockets have been encountered. This is, strictly speaking, a pocket camp, and many valuable deposits have been taken from the numerous veins that run through the district. Our prospectors being crowded from this portion of the field by reasons above mentioned, are searching the hills farther back, and it is there that future discoveries will be made. A great amount of prospecting is being done on our river channels, and with the most encouraging results. An Oakland company are operating a channel mine about two miles distant from this place, and though they have only been working a short time, have made discoveries that warrant them in erecting mills to crush the cement. This property was worked to some extent in early days, but water was encountered and in such quantities as to force them to suspend. It is located on patented ground, but the operators, when notified that they could not work the mine in consequence of this fact, informed the patentee that they would do so, and if he desired to test the validity of his patent to take legal measures to stop them. This put an end to the controversy, and if a few more companies of the same sort were operating here the agricultural patent business on recognized mineral land would receive a serious setback.

The Zeracraft mine on the American river is still yielding well, and the grade of ore becoming better as work progresses. The mill is running steadily and produces monthly between \$8000 and \$10,000.

It is reported that a valuable quartz strike was made on the river last week, the ledge on the surface ranging between two and four feet in width, and assaying nearly \$200 per ton. There is no question but what many fine veins will be found along this once fabulous gold-bearing stream. It is a fine field for the prospector, and a few more discoveries will lead to a thorough search of the country in the immedi-

ate neighborhood of the river to its mountain source.

Parties who have just returned from Last Chances, state that the snow has entirely disappeared, and that mine-owners are making preparations to commence work. This is undoubtedly one of the most promising districts in this portion of the State, and the development that will take place this season will be productive of results that will interest mining men. Nearly all the ore taken from the Nimrod and Leopard shows gold visible to the naked eye and the entire ledge from wall to wall will pay to crush. Nine locations have been made on this lode, every one giving good surface returns. Newcastle, Placer Co. MINER.

### Electro Chlorination.

#### Treating Low-Grade Ores.

The Leadville Herald-Democrat has an article on the above subject, from which we extract the following:

The inventor of the process of electro-chlorination is Mr. Henry B. Slater, whose residence for the past two years has been at Detroit, Michigan. Last autumn he succeeded in interesting Mr. William H. Stevens of the Iron Silver Mining Co. in his invention, and for the purpose of securing a practical test of its value Mr. Stevens had shipped from the Iron Silver mine to Detroit some two tons of ore. In making the test nearly the whole of that amount was used.

In order to ascertain, in the event of success, what might be done with a class of ore which has heretofore been practically valueless, a mineral was selected containing 25 per cent of zinc, 20 per cent of iron, 15 per cent of lead and 12 ounces of silver, with (approximately) 28 per cent of silica and 12 per cent of sulphur.

Prof. Alfred DuBois, chemist of the Iron Silver mine, followed the shipment of ore to Detroit, and gave his own personal scrutiny to the entire operation. His report to the company concerning the same is given herewith, and reads as follows:

DETROIT, MICH., March 15, 1888.

Mr. Ashley Pond, President of the Iron Silver Mining Company: At the suggestion of Mr. W. H. Stevens, I make a statement relative to the experiment in treating zinciferous ores by electro-chlorination invented by Mr. Slater. During two months I have watched the process in operation as conducted by the inventor, and have myself verified every portion of the operation. During various brief periods, and especially during the past three days, I have alone conducted it in all its parts, he being entirely excluded therefrom, and not being present at any part of the time. Although I was before convinced there could be no deception, the latter proceeding rendering it quite certain and beyond all question.

I will now state as my conviction that the process is simple, effective and reasonably cheap, as compared with other and older methods of treatment for these ores.

Recent improvements in electro-generating machines has rendered the production of chlorine possible at a very small part of the former cost of this very powerful agent, and upon this depends this process.

The ores to be treated require to be roasted as a preparation, but not of necessity, to what is technically termed a "dead roast." If but partially roasted a point is reached at which an important proportion of the zinc will be converted into a sulphate, soluble in water and precipitable as is the chloride, but it is also available directly for electrolytic deposition of metallic zinc, thus avoiding the use of sulphuric acid for the preparation of the fluid by redissolving precipitated oxide for that purpose.

Or, if more desirable, the sulphate solution may be precipitated as the chloride would be with satisfactory results, except possibly a trace of sulphate of lime may remain in the oxide produced.

If the roasting is prolonged, the proportion of zinc sulphate diminishes and a loss of zinc also will follow in the approach to dead roast.

If the separate use of the sulphate of zinc is desired, it may be filtered out with cold water and the residue may then be chlorinated to complete the extracting of the zinc from the ore. The quantity of chlorine consumed will obviously be diminished by so much as sulphate of zinc is formed, since chlorine can no longer combine therewith.

I am well satisfied with the process, and believe fully it will prove even better in larger practice than in the small way tried here. If any difficulties present themselves they will be of a mechanical nature and will be overcome as soon as their nature is developed. Respectfully yours,

ALFRED DUBOIS.

Colonel S. S. Robinson, manager of the Iron Silver, was also in attendance, in person, upon this Detroit test and was so thoroughly pleased with the result as to recommend its further and more thorough trial in Colorado.

The practical result—or more properly speaking, the financial result—is given below.

In order, however, that it may be more readily understood, we will say that as a preliminary measure (in the practical operation), the mineral will be dressed, removing the lead and gangue—of course, including the silica. Subsequently the lead will be returned and added to the pulp.

It is also proper to say all the estimates of the cost of the treatment, as herewith given, are based upon Leadville prices in every detail—the figures having been furnished by Mr. Stevens.

Value of ore containing 25 per cent zinc, 20 per cent iron, 15 per cent lead and 12 ounces of silver per ton, worked by electro-chlorination process.

Cost of removing zinc per ton of ore... \$5.53

After dressing out the lead and gangue, and removing the zinc, the ton of ore will have been reduced to 753 pounds. The lead that was dressed out can now

be added to it, and we have 753 pounds of pulp plus 347 pounds of lead sulphide, equal 1100 pounds of ore in a condition for smelting equal to a first-class carbonate ore containing all of the lead, silver and iron, of the original ton of ore. But now the percentage of lead has been increased to 27.27 per cent. The cost of smelting will then be, by the schedule, \$5.50 per ton. But we only have 1100 pounds, therefore the smelting charge will be 55 per cent of \$5.50, equal \$3.03.

Total cost of treating for zinc and smelting 1 ton of ore... \$8.56

We get in return 620 pounds of zinc oxide at, say 5 cents per pound, equal \$3.10

Thirty cents per unit for the lead, of which there is 300 pounds... 4.50

And of silver 12 ozs., at N.Y. quotations, less 5 per cent, say 92 cents per oz. net —12 ozs. at 92 cents, equals \$11.04... 11.04

Total value of product... \$46.54

Less cost of production... 8.56

Net value of product at Leadville... \$37.98

If we place the cost of shipping zinc oxide to market at say \$10 per ton or \$20 per ton including packages, we shall have to pay for the 620 pounds of zinc oxide, \$8.20... 6.20

Which shows a net profit per ton of ore... \$31.78

For above grade of ore which heretofore had no value, we shall have for 50 tons per day a profit of... 15.80

And for 300 days in the year... 476.00

It is our impression that the foregoing statement of the cost of treatment by this method is sufficiently clear. That it will require no word of explanation from us. It was prepared by the inventor, himself, and when we say that a similar calculation of the cost was prepared by Mr. Stevens, which reduced the aggregate cost in a material degree, it will be admitted that the estimate here given is intended to be amply conservative. Mining men can readily make their own comparisons with the ordinary cost of smelting any peculiar grade of ore with which they may be familiar.

Now regarding the zinc oxide as an article of commerce: The ordinary domestic article is quoted at about 4½ cents per pound. The product of this method, however, is asserted to be of a much higher grade. In support of this assertion reference is made to Dr. Moore of New York, chemist for the Passaic Zinc Co., who is said to have reported it equal to the best "Paris Red Seal," which is worth ten cents per pound by the carload.

Regarding a further practical test of the Electro-Chlorination process—a test the results of which may be scrutinized by our readers, in person—we are glad to be able to state that a small plant is now in process of erection at the Omaha and Grant smelter, in Denver. It is being erected after instructions furnished by the inventor, Mr. Slater, and under the immediate supervision of Prof. Du Bois. It will have a capacity of eight tons per day, but for the purpose of testing its merits in small lots, but one or two tons per day will be treated.

It will be supplied with zinciferous ores from our own camp.

These experiments will be watched with great interest and we shall take pains to furnish our readers with net results that may be considered as reliable.

Mr. Slater informs us that his estimate of the cost of a plant—erected at this point—with a capacity of 50 tons per day, would be \$100,000. This would include the cost of seven dynamos, each having a nominal daily capacity of eight tons of zinciferous ore.

### A Temperance Mining Camp.

A temperance mining camp in Arizona, or any other mining country of the Great West, is somewhat of a great novelty, yet that is what they propose to have at Cooper Basin, as will be seen by the following, which is a copy of a notice posted up prominently in the camp:

#### Notice.

Desiring to have at the Basin a moral and respectable camp, the Copper Basin Copper Company establish the following rules for the benefit of their employees:

Profane or other improper language will not be allowed.

Intoxication prohibited, although no restraint is imposed on the temperate use of liquor.

Gambling in any form prohibited, although no objection to the use of cards, chess, checkers or dominoes.

The patronizing of any liquor saloon, gambling-house or any other place of bad repute by any of the employees of the company is prohibited.

The violation of any of the above rules will subject the offender to immediate discharge.

Any employee of the company unable or unwilling to comply with the above regulations will please call at once at the office for settlement of his account.

COPPER BASIN COPPER CO.,

By J. J. WILLIAMS, Supt.

Copper Basin, Arizona.

As a clincher to the above, all employees of the company are required to subscribe to the following pledge:

We, the undersigned employees of, doing business for the Copper Basin Copper Co., do hereby subscribe to the rules and regulations of the camp, and pledge ourselves to refrain from the use of profane or improper language, from gambling, from immoderate use of liquors, and agree not to patronize any liquor saloon, gambling-house, or any place of ill repute while in the employ of the company.—*Journal Miner.*

ACTIVE preparations are going on for celebrating the 4th of July in this city.

### The Expression of Our Movements.

(Continued from Issue of June 16th)

(Translated for the Press from the French by M. N. M.)

#### The Pantomime.

The literal sense of the word pantomime is, a total imitation; that is to say, that everything in it is represented by imitation. It is figurative language. Pantomime in this sense differs completely from what is called the language of signs, because signs are movements purely conventional, of which we make use in order to replace letters or ideas, while pantomime consists in the reproduction, as exact as possible, of the expressive movements, just as nature produces them under the influence of such or such sentiment. The expressive effect of this kind of movement is so true, so evident to all eyes, that pantomime has become an art, either alone or mixed with the dance, and is composed of representations in which, notwithstanding the speechlessness of the actors, the interest and the pleasure are at times as intense as in a spoken piece.

Taken as a spectacle or as figurative language, pantomime is from the point of view of the art of physiognomy, the most important and the most interesting of the expressive actions, for the reason that, being applicable to all states and sentiments of the mind, it forms a dictionary of ideas as complete as that of the spoken language. To try to analyze here the expressive movements would be to again go over all the work that we have done, the precise object of which is the expressive movements; we will then only refer to what we have said, remarking, however, that if our observations are just, we should see them verified in all pantomimes, whether natural or theatrical.

#### The Pantomime

Makes an integral part of every ballet; it also blends in great proportion with the properly called dance, not only in the theater, but likewise in the greater part of the character dances, in which the look, smile, gesture, and the movements of the body are continually in action to express the various sentiments of the mind. Apart from some errors of false taste or some symbolical movements of which the origin and sometimes the sense are unknown, the signs are the same as in nature, and the more natural the signs, the truer will be the pantomime. Nevertheless, for the reason that art would cease if it were limited purely and simply to a strict imitation of nature, pantomime has become a spectacle which not only adds to the physical reproductions, some expressive movements (the talent, soul, sentiment of the artist, that indefinable power which takes truth and represents it without in any manner obviating it from that which every one recognizes at a glance), but gives, moreover, an evidence, an eloquence, and an intensity, which that truth has not in nature.

The nature of the pantomime requires, too, an expression much more intense in the movements, since it is necessary to produce by these movements alone, what they ordinarily express by their conjunction with speech, so that here the accessory must perform the role of the principal.

#### The Expressive Action

In it is likewise much more accentuated, and if the actor is not very capable he easily falls into exaggeration. This moderation is difficult to maintain, and it gives, it may be said, *en passant*, the reason of the ridicule which attaches to certain actors who, in spoken roles, abandon themselves to a pantomime as energetic as if it were a dumb role they were mimicking. We must never lose from sight that, with the man who speaks, the mimique is only an accompaniment of speech, and that the latter must be so subdued as never to dominate the former. The silent pantomime, when it is executed with talent, presents to us a visible and moving picture which attains effects more extraordinary than those of speech.

In the ballets, the congruities and necessities of the description take much of the power from the pantomime and imposes on it many modifications. The obligation of following the musical measure, the conditions of duration or development of the steps and attitudes, and also the traditions or personal inspirations of the dancers, introduce many elements foreign to the natural mimique.

#### It is in the Pure Pantomime

That we must observe this great medium of expression. The ancients in their immense theaters had carried the pantomime to a high degree of perfection. Unfortunately, as in the dance, it is transmitted but in tradition, and teaching only by imitation, has left no written documents by which to reproduce it, nor any other trace than the appreciation of contemporaries. We can rest assured that the same means of expression have been employed at all times to express the same sentiments, but there is in the mimique one part, of conventional signs, which must have varied according to the times, but about which we can know nothing positively. The presumption is that the present mimique of our theaters had its origin in Italy (the Italians having probably received it from the Romans and Greeks) and we our pantomime through that intermediary. Be that as it may, it is certain that the pantomime, whether natural or theatrical, is in very strict analogical relation with the language of each people, that is to say, it has the principal char-

acteristics. It is clear, analytic, sober, with the French; lively, colored, exaggerated, with the Italian.

#### We Have Seen at Paris.

Negroes from Africa, savages, who, with the contortions and grimaces of persons possessed, showed us pantomimes as savage as themselves. But the most extraordinary of this kind are the English mimics. I must admit that no spectacle in the world impresses me as much as their setting, and when I see the laughter almost apopleptic which they excite at each instant in the house, I think my personal impression has nothing of exaggeration. With blows, falls, leaps and grimaces, these people cause 2000 or 3000 persons to shake all over and explode their laughter. And it is not only in the burlesque that they produce such effects. At the moment in which we least expect it, without transition and without reason, that frightful gaiety suddenly ceases and the same actors (become specters) perform some lugubrious scenes; it is the delirium of horror, which frightens us and which freezes us to the marrow.

The genius of the English people is complete, rugged, energetic, sharp and cold as steel, somber as the tempest or death, profoundly human; Shakespeare, in short, who will always remain as the most astonishing incarnation of a nation in a man.

#### In Order to Give an Idea

Of the power of expression that an intelligent man can receive from the pantomime, I will relate a fact which one of my friends witnessed. In a city of the province in which he sojourned for some time, he met a man who there occupied an important position, and who, while a student at Paris, had frequently associated with artists and comedians. He had learned many scenes of divers kinds, and among others he performed this one. He seated himself and appeared to fall into a reverie; then, like a man who summons up some agreeable souvenirs, he smiled at first vaguely; by degrees his figure expanded, his laugh developed, augmented, and at last burst forth with so much force, that all the by-standers laughed extravagantly. In an instant he stopped as if a different idea had come to disturb his merriment. His countenance became serious, his respiration abrupt, and difficult; sobs, restrained at first, caught his breath to heave. He raised his hand to his brow, caught hold of his hair, and threw back his head; then a hurst of supreme despair, a cry and a flood of tears came at once, and this mute picture was so harrowing that every one was compelled to weep also. And yet he had not spoken a word.

#### In Another Description

I am able to give an account of an experience personal to myself. I reached home all upset at having seen in the street one of those scenes which misery presents us, alas! too often, but the object that I saw had in it something poignant; it was only a pantomime, but what a pantomime! A woman was kneeling, seated upon her heels. Beside her, two small children, a boy and a girl, reclined against each other, who, with lowered heads, glanced at me sideways, like little savages, and here is what pierced the heart like the thrust of a lance. The mother, with head thrown back, extended arms, and outstretched palms, neither spoke nor moved. It was distress, despair, in a posture of distracted affliction, and she seemed to say: "Behold, I am blind; I have two children to support; it is not enough to implore alms with one hand, I extend to you both!" I do not remember any drama or even tragedy that has disturbed me like that scene, like that gesture, and yet that sightless person differed from others only by the two outstretched arms and open palms.

The tragedians likewise make gestures of this kind, much more violent, much more pathetic and the tenors of the opera have a mimic still more barrowing; but the making of the gestures is not everything, they must be made to the purpose. That woman made her gestures *apropos*, and they were indeed impressive.

A VOTING MACHINE.—A system of automatically taking and recording votes at elections has been invented and patented by John W. Rhines of St. Paul. Printed tickets are done away with altogether, each voter recording his vote by means of a machine. The machine consists of a box in which a series of keys are used to print numbers upon endless slips of paper running upon rollers. The keys run crosswise in rows on the lid of the box, each row representing a candidate, while each key signifies one of the competing parties. The voter raises a cover over the lid of the box and presses the keys marked with the names of the candidates he votes for and the party to which he belongs, by this means printing numbers upon the slip inside the closed box. He then closes the lid of the box, covering up the keys. Repeating is impossible without detection, as the keys stay down until the lid of the box is again raised, when a ratchet releases the keys, leaving them ready for use again, and at the same moment striking a gong. It would be necessary for the authorities to publish the whole plan of the arrangement of the keys of the machine, together with the allotment of the candidates and parties to the keys, so that all voters may become acquainted with the arrangement. The cost is said to be below that of other vote-recording machines. A company has been formed to handle the machines, and it will be known as the Rhines Ballot System Company.

## Passing Events.

The formal transfer of the Lick Observatory to the Regents of the State University was made this week by the Lick Trustees, and now the scientific work with the big telescope and appliances will commence.

Further purchases by English capitalists near Aurora, Nevada, will be a good thing for that whole region. Large reduction works are to be put up immediately, which will give the miners a chance to work the ores.

Gold lode and placer mining is greatly on the increase in Colorado. The latter branch of mining has long been neglected there, but of late more attention has been paid to it.

The MINING AND SCIENTIFIC PRESS this week closes the volume. It is as well to remind readers that this is a good time to renew subscriptions, so as to commence with a new volume.

During the coming week the national holiday will be observed. On this occasion the monument to Francis Scott Key, who wrote "The Star Spangled Banner," will be unveiled in Golden Gate Park, where it has been placed by the Lick Trustees in obedience to the desires of the late James Lick.

ELECTRIC LIGHTS, railroads and steam launches are now being used by the Chinese while repairing the Yellow River breach, in Honan.

## Close of the Volume.

This is the last number of volume LV of the MINING AND SCIENTIFIC PRESS. On the last pages will be found this index, a glance at which will show how wide a range of subjects has been considered during the past six months. The PRESS has for many years been a weekly visitor in the mining camps and towns of this coast. Devoted, as it is, mainly to the mining industry, it is deserving of the support of all who have an interest in mining matters. It is not too much to ask our friends who have been subscribers for years to call the attention of others to the advantages to be derived from reading the PRESS. People who are engaged in mining or metallurgy cannot well afford to be without a journal which obtains from all sources information of value and interest to them. The older mining communities know the paper well, but among the newcomers to the coast of late there are doubtless many who would become regular readers if those familiar with it should call attention to the matter. With a larger subscription list, our sphere of usefulness is enlarged.

## Coal Product of 1887.

In the United States the total production of all kinds of commercial coal was 123,965,255 short tons (increase over 1886, 16,283,046 tons), valued at the mines at \$173,530,996 (increase, \$26,418,241). This may be divided into Pennsylvania anthracite, 39,506,255 short tons (increase, 2,809,780 short tons), or 35,273,442 long tons (increase, 2,508,732 long tons), valued at \$79,365,244 (increase, \$7,807,118); all other coals, including bituminous, brown coal, lignite, small lots of anthracite produced in Colorado and Arkansas, and 6000 tons of graphitic coal mined in Rhode Island, amounting in the aggregate to 84,459,000 short tons (increase, 13,473,266 tons), valued at \$94,165,752 (increase, \$18,611,123).

The colliery consumption at the individual mines varies from nothing to eight per cent of the total output of the mines, being greatest at special Pennsylvania anthracite mines and lowest at those bituminous mines where the coal-bed lies nearly horizontal and where no steam-power or ventilating furnaces are used. The averages for the different States vary from 2.10 to 6.17 per cent.

The total output of the mines, including colliery consumption, was: Pennsylvania anthracite, 37,578,747 long tons (increase over 1886, 2,725,670 long tons), or 42,088,197 short tons (increase, 3,052,751 short tons); all other coals, 87,837,360 short tons (increase, 14,129,403 tons), making the total output of all coals from mines in the United States, exclusive of slack coal thrown on the dumps, 129,925,557 short tons (increase, 17,182,154 tons), valued as follows: Anthracite, \$84,552,181 (increase, \$8,443,661); bituminous, \$97,939,656 (increase, \$19,458,600); total value, \$182,491,837 (increase, \$27,891,661). The above figures show a notable increase in 1887 over 1886 in the aggregate output and value of both anthracite and bituminous coal.

For these figures we are indebted to Chas. A. Ashburner, who has collected them for the U. S. Geological Survey (Department of Mineral Statistics).

The total production and the spot value in each State and Territory, exclusive of colliery consumption, are shown in the following table:

States and Territories.	Quantity.	Value at Mines.
Pennsylvania:	Short tons.	
Anthracite.....	39,506,255	\$79,365,244
Bituminous.....	30,866,602	27,809,941
Ohio.....	10,361,708	9,098,848
Illinois.....	10,278,890	11,152,596

## Proceedings in Chancery.

The business of closing the hydraulic mines by injunction and of imposing fines on parties guilty of violating such decree still goes on. In considering these proceedings, carried on and consummated without the intervention of a jury, the unprofessional mind is greatly puzzled to reconcile the same with that clause of our Constitution which declares that "the right of trial by jury shall be secured to all and remain forever inviolate." Aside from all consideration of the merits of the controversy, it is a fact that within the past ten years property to the value of fifty million dollars or more has been virtually confiscated in this State, and yet no jury has ever been permitted to pass on the merits of a single case, nor have the defendants been suffered to appear with their witnesses before the judges who issue these injunctions. The testimony is taken by a commissioner and afterwards submitted to the judge, who considers and passes on the evidence, neither of the parties, complainant nor defendant, ever appearing in the judicial presence.

This one man in the seclusion of his "chambers" having looked over the testimony and come to a conclusion, issues his mandate, which is forthwith carried into effect. It is true his decision may, on appeal to a higher court, be confirmed or reversed, but no where, from the time the complaint is filed till the case is finally adjudicated does a jury appear as a factor in the proceedings.

We are told that these being cases in equity belong to chancery jurisdiction, there being no suitable or sufficient remedy provided for them by law. That is no doubt so; and far be it from us to question the wisdom of this anomalous arrangement, for which there is presumably a good reason. We are only speaking of the way the thing impresses the unclerical, non-judicial sense, and wondering where the Constitutional provision quoted comes in! As the judge may dispose of the case without the interposition of a jury, so may he fine the delinquent in such sum as he sees fit. The penalty imposed may be a hundred, a thousand, or for that matter, we suppose, a million dollars, perpetual incarceration in the county jail being the alternative of its non payment.

For the damage done of a night by a single swine, the owner of the hog, if sued, may demand to have such damage assessed by a jury of his countrymen, yet in the case of the hydraulic miners vast and profitably productive operations may be suddenly arrested and valuable estates with all their costly plant be rendered utterly worthless on the dictum of a man who never saw the property or its owners, and who from personal inspection knows nothing about the extent of the injury complained of.

It is considerations like these that so stagger the layman when he comes to wrestle with this strange proposition. To the legally illiterate, that is, the man little conversant with the mysteries and logic of the law, this seems incomprehensible and past finding out. But, as before remarked, there must be good reasons for it, albeit they are to the ignorant a stumbling-block and to the laity foolishness.

To the man educated to the profession the law seems, what the great English commentator calls it, "the perfection of human reason." To the heightened outsider it seems full of defects, quirks and inconsistencies, the which are made manifest in nothing more than this ignoring of trial by jury, an institution lauded as one of the great safeguards against judicial tyranny and the encroachments of official power, and for the preservation of which the advocates of popular rights have in times past made the extreme sacrifices, even to the surrendering up of life itself. To this same outsider that seems also an unreasonably broad discretion which admits the imposition of penalties without limit and not specially provided for by law, making the punitive power of the judiciary all but omnipotent. But then these reflections may be born out of wisdom but of ignorance. We can only say they seem to be naturally suggested by the subject.

T. A. FROSHFIELD, an ex-mining commissioner for the district of Cornwall, England, accompanied by Mr. Dawling, a mining expert, is in San Francisco, en route for Alaska. It is the purpose of Mr. Froshfield to examine a number of mining properties in the Territory in the interest of a number of foreign capitalists.

## The Cumulative and Staying Industries of California.

It has been well remarked that the industrial gains made in California have all been cumulative—the building up of new pursuits having never been at the expense of those previously established. There has been found need and room for all. If land culture has been developed here at a wonderful rate it has not worked any detriment to mining or other vital interests; nothing has been neglected or retarded because increased attention has been paid to some new branch of business. All that had the least chance to gain a permanent foothold have lived and thrived at least moderately well, many having forged ahead at a most astonishing rate.

At the start mining was the only largely productive industry in the State. We had agricultural resources of a high order, but we were then ignorant of their existences. As the placers became impoverished, we were forced to look about for something else to do. Timidly and in a small way our people began to cultivate the soil, experimenting at first with wheat-raising, which speedily grew into a great and prosperous industry. Then came dairying, wool, fruit and grape-growing, all engaged in with like distrust, but since reaching a great expansion. In due time various manufacturing branches were undertaken, and generally with the same good results, much better, indeed, than were usually anticipated by the public at large.

We look back and recall how common was the opinion that these earlier efforts to plant new industries in California were wholly premature. It was in this light that the founding of our woolen and rolling-mills, our cordage, wire and lead-pipe works, and many similar branches of business, were generally regarded. With capital, labor and the raw material so dear, and the home markets so limited, their failure seemed inevitable. And it must be confessed that they had a hard struggle at first. But these early struggles survived, the most of these pursuits have since reached large proportions and proved fairly profitable.

Where these now prosperous and well-established industries once stood, others, such as the manufacture of cotton, jute, carpets, oil-cloth, etc., stand at present, fighting for a foothold with a dubious future before them. That they will, like their predecessors, survive these struggles and eventually prove paying ventures, is more than probable. That they will do so let us hope and thus further enlarge this grand California structure so made up of cumulative industries.

Looking about and comparing the industrial condition of California with that of her neighbors she is found to occupy the first rank as a wine, wheat and gold-producing State, being only second as a producer of fruit, wool, barley, hops, and several other agricultural staples.

Contemplating the situation we are led to inquire, what next? In what direction will be our next advances, and what our next new element of wealth? To our mind, California's special wants and opportunities consist now of increased population, manufactures, and gold mining. There is need for more people and room for them, too; so also of manufactures, but, above all, there is both room and necessity for more gold mining. Here is the one business that instead of etanding in the way of others helps them all. It aids and encourages every other, but competes with none.

Looking at our auriferous resources there seems room for nearly as great expansion here as in the field of agriculture. As regards the area of land available for tillage we know its extent and value. But this cannot be said of our mineral domain, or the wealth it contains. We know this wealth is large, but how large cannot be ascertained in advance of exploration. That we can maintain our present output of gold for centuries is certain. That it can be largely increased is probable, but how much remains a matter of conjecture. There is reason to believe that it will within the next 50 years be doubled—it may be quadrupled. Up to a certain limit there is among all our domestic products none so certain as that of gold, an assurance that ought to beget great confidence in the future of this business, than which none is likely to prove more permanent or more profitable. As it came first, it is the one of all our industries that has come to stay.

**The Belmont Mine Accident.**

On Monday last about 1 P. M. a fire broke out in the hoisting works of the Belmont mine, near Ophir, Placer county. Three men, James and William Reardon, brothers, and Joseph Hawkins, were at work in a drift 100 feet from the surface at the time, and were unable to make their escape. The alarm spread rapidly, and crowds from Auburn, Newcastle and Ophir thronged to the scene. The flames were soon extinguished and the work of rescuing the imprisoned miners was commenced.

A set of men, of whom Andrew Larsen was one, first attempted a descent of the shaft but were driven back by the foul air, almost overpowered. Then a second attempt was made to reach the men 100 feet below the surface, and

the mine, and frequently the miners there had been warned against such a practice.

THE MONTE CRISTO MILL at Minersville, Utah, has been running off and on this last two months on low-grade ore, producing hullion, and is working now on custom ores. At the Monte Cristo mine, in crosscutting 135 feet in the tunnel, they found a five-inch seam of quartz assaying  $4\frac{1}{2}$  ounces gold and three ounces silver. They also struck into a cave of quartz ore carrying some silver; have not got to hanging-wall yet. The mines in Star district are being worked slowly by chlorides, and the higher grade lead ores are shipped to Salt Lake for sale.

OVER in Australia they value the Broken Hill mine at \$50,000,000 and the Mt. Morgan mine

**Foundry Notes.**

All the contracts at the Savage Foundry will be completed, and the creditors will then determine what is to be done with the plant. The failure will throw a number of men out of work. The Dodge pulverizers, crushers and concentrators were all made at this foundry for Parke & Lacy.

The Fulton Iron Works continue to manufacture marine engines for coasting vessels, having obtained the hulk of this work.

The cruiser Charleston will not be launched on the 4th of July, as had been anticipated, but she will be completed ready for launching in a few weeks. The Union Iron Works have a great deal of marine work on hand, in addition to this cruiser. Their dry-dock has been a good

**Dust Chambers.**

We recently described in the PRESS the circular smelting furnaces at Leadville, Colorado. In this number we give a sketch of the dust chamber arrangement. On the feeding floor is a large wooden trough in which the roasted flue dust is mixed with about 20 per cent of milk of lime. The mixture is then spread over the ore beds placed on the floor. Immediately outside the main building, on the feeding-floor level, are the flues connecting the stack of the furnaces with the dust chamber; this arrangement at smelter A is the only one of its kind in Leadville. The upper part of the stacks *EE'* of the furnaces *A A'* are connected by means of the sheet iron flues *HH'* with a main sheet iron flue *F'*, which enters the brickdust

PERSPECTIVE VIEW OF DUST CHAMBER AND ARRANGEMENT OF FLUES FOR COLLECTING FLUE DUST.

again did Larsen volunteer his services. Slowly they were lowered down into the shaft, but the noxious gases were more than human beings could stand, and once more was the little hand of heroes drawn back to the surface. But Larsen who had twice made the descent was dead when the cage reached the surface. Chris. Linde, J. Weick, Al. Armbruster and several others were almost overpowered by the foul air, narrowly escaping with their lives.

Nothing daunted, however, the work of rescue was continued, and finally a party of five descended the shaft and penetrated to the drift where the imprisoned men had taken refuge. The bodies were found in the drift about 40 feet from the shaft. The shaft is 100 feet deep. Death was from asphyxiation. The miners must have lived at least three hours after the fire broke out, as at that time a steel rope that was hot was let down into the mine and one of the men was found with his hand burned as if he had grasped the rope. A blast was fired in the mine after the fire broke out on top. The fire originated through carelessness, for the man who ought to have remained on top quit his post and went down into the mine to work. To do that way was a habit at

at the same figure. American silver miners are in demand. A gentleman recently from Melbourne says: "The inducements for good practical miners competent to take charge of mines in Australia are very great, and competent men can command yearly salaries ranging from \$2500 to \$5000. Australians do not understand silver mining very well, and are anxious to have experienced American miners go to the colonies."

THE STEWART MINING BILL.—We have received several inquiries concerning this bill, and have written to Senator Stewart for details. It is not probable, however, that final action will be taken at this session of Congress. The laws will remain as before, for this year at any rate.

THERE are two mills now crushing ore from the Lang Syne mine, at Dun Glen, Nevada, and reducing 45 tons daily. The owners have put rock-breakers and elevators in place, and work the ore at the least possible expense.

DURING the last lease of the Divoll mine, Tuolumne county, nearly \$150,000 was taken out. This is a famous pocket mine, and the owner, J. G. Divoll, will now work it himself.

investment and is constantly in demand.

On Tuesday last six workmen were injured by the flowing over of a mold of molten lead at the Empire Foundry, at 135 Fremont street. Four of the men luckily escaped with slight burns of the hands, while the others had their feet and hands burned.

A fire this week did some damage to the brass works of Weed & Kingwell and the Columbus Machine Works. Royland's Brass Foundry was also burned out.

TRANSFER OF THE LICK OBSERVATORY.—The Lick Astronomical Department of the University of California is now completely organized. The formal transfer took place this week at Berkeley, when the Lick Trustees turned the observatory over to the Regents of the University. E. M. Mastick, on behalf of the Lick Trustees, addressed the Regents, and Prof. Joseph Le Conte replied for the Regents.

THE 40-stamps of the Nevada mill, crushing Chollar and Potosi ores, are driven by a Pelton water-wheel.

SOME of the richest pay gravel ever handled in Smartsville is coming out of the Blue Point.

chambers *D'*. Each of the flues *HH'* is provided with one, and flue *F'* with three sliding doors placed on the upper part of the flues and parallel with them, and used for clearing the dust which accumulates periodically in the flues.

The flue *F'* rests about half way on a small flue dust chamber *N*, made of bricks and provided with a sliding door *d*, for the extraction of the flue dust. Immediately at the rear of the dust chamber *D'* are long rows of ore-hins, and immediately behind them is a large roasting furnace. The level immediately above and at rear of the roasting furnace, is the fuel level which communicates with the blast furnaces by means of an elevated platform *R'*, provided with a track of rails. The fuel charged on light sheet iron mining harrows is thrown down next to the feed holes along the chutes *S*. This saves much labor; two fuel men are sufficient to supply all the fuel needed in smelting, but its great inconvenience is that of filling the whole feeding floor with a cloud of charcoal dust. The engraving, which we take from Emmon's "Geology and Mining Industry of Leadville," shows in perspective the general disposition of the dust chamber and connection,

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**PLYMOUTH.**—Cor. Amador Ledger, June 23: The mining outlook is dull at this time, there being no mine work going on except at the New London, which continues sinking. There is strong talk of a mill being erected on this mine this summer, as there is an abundance of good ore, but so far we hear of no preparations for the building of the mill. The Plymouth Consolidated looks as dead as ever, and there is no rumor of starting it up at all, but it may start some time for all that.

**MISCELLANEOUS.**—The superintendent of the Sutter creek mine reports as follows: For the week ending June 16, this company has extracted 70 tons ore, and milled the same. Crosscut No. 2 advanced 15 feet, crossing several rich strata of quartz. At present mill is running steadily. A. P. Minear returned from San Francisco Wednesday evening. It is reported that he has secured a mill site on the Amador Queen ground, and is negotiating for a right-of-way over the Doyle claim. The Dine mine, near Volcano, has been started up by N. G. Young. A. J. Sargent struck a small pocket on his claim at Middle Bar last week, from which he took out \$500 in a short time.

**FROM DRYTOWN.**—Cor. Amador Ledger, June 23: There has been some change in the mining outlook since my last letter. The Cosmopolitan is looking well, and sinking is progressing very rapidly. The Gover is looking fine, and considerable improvements are being made around the mine and mill, and several new buildings are being erected in the town of New Chicago. The Potosi mine will start up again next Monday. An English company from below are here making every necessary arrangement to open up the mine. It is their intention to put in a new boiler and clean out the old shaft and re-timber, and other necessary improvements. The Loyal mill is kept running steadily on rock taken from the mine.

## Inyo.

**DEEP SPRING.**—Inyo Independent, June 23: Sam Piper is at work on a gold-bearing ledge north of Cottonwood creek. Turner and his partner quit work on their silver ledge about ten days ago. They sunk 200 feet on the ledge and at that depth it was as "barren as a hound's tooth," so says the reporter. Nothing new in the district had been struck at last report.

## Nevada.

**VERY RICH STRIKE.**—Tidings, June 20: Last evening the W. Y. O. D. mine boys made a very rich strike at a point 225 feet from surface and 130 feet from the shaft. The ledge is strongly defined and is three feet thick. Gold in sheets half an inch thick runs through it, and the ore throughout is "peppered" with the precious metal. To-day several sacksful of the rich quartz was taken out. Everybody who knows of the strike is rejoicing with the plucky young owners of the property. The suit for foreclosure of mortgage will be dismissed, Weissbein Bros. having purchased the obligations and extended time for payment. Sinking in the shaft is going ahead steadily.

**THE JUNCTION.**—The Junction claim is situated about two miles from San Juan and on the westerly side of the North Yuba river, near its junction with the Middle Yuba; hence the name "Junction." It was located about two years since by Frank N. Morris and G. N. L. Powell. These gentlemen obtained encouraging results from the prospecting they did upon it, but want of funds to develop the property caused them to look around for energetic and thinking men with whom to associate themselves and form a company to open up the mine in a systematic manner and work it on strictly business principles.

**THE GOLCONDA.**—Herald, June 20: The ledge formerly known as the "P. P." afterwards as the Egyptian King, but now as the Golconda, will soon be attracting attention. It lies just to the east and parallel with the El Dorado. George E. Hothersall and George Riley are part owners and are going to spend their vacation developing the ledge. Mr. Hothersall went over to Columbia Hill to-day, we believe, and next week will start operations. The ledge looks well and rock from it has been crushed which yielded \$4.75 per ton near the surface.

**MINING SALE CONSUMMATED.**—Tidings, June 20: Developments bear out statements made by the Tidings recently in connection with the sale of the Pittsburg mine. The sale was not consummated until last Thursday, when transfer was made to the English company and the first installment of the purchase price received. The new company have a representative here, Mr. Elliott by name, and he is instructed to put underground work. First, however, a Pelton wheel for hoisting purposes is to be put in, and the landing raised to make space for depositing waste rock. Trails are to be laid in the shaft, and then sinking will be in order. When ore in quantity and of quality warranting the reconstruction of a 10-stamp mill, and the addition of 10 stamps shall be found, such work will be done, and not before. The mining sharps of our unreliable Nevada City contemporaries to the contrary notwithstanding, no contract for a 20-stamp mill has been made. The new company's business office will be at Grass Valley, and from this city supplies will be drawn; \$50,000 will be spent in developing the property.

**GRAVEL.**—North San Juan Times, June 22: Archer & McIntyre of this place are the owners of a gravel claim about two miles from town which affords an example of what may be accomplished by men possessing industry and perseverance. The locality of this claim is familiarly known as Jersey's Slide, and the above-named gentlemen commenced work thereon four years ago. During the first 18 months they met with poor success, in that time taking out but \$40. Nothing daunted, operations were continued and about two years since the mine was put on a paying basis and has remained there. The gravel channel is 135 feet wide and is worked through a tunnel 200 feet in length. The earth's looseness permits the working of only half the channel's width at a time, necessitating two drifts to breast out a piece of ground the width of the gravel channel and about 65 feet in length. When one

side of the main tunnel is worked out in this manner, the other side is treated likewise, and then a new tunnel is driven and the same drifting and breasting tactics repeated. Archer & McIntyre employ four men, which, with themselves, make up their crew. Two shifts are worked and the output of gravel in 24 hours is about 30 carloads, which is placed on a dump until enough has accumulated to warrant a run, when the dump is washed by means of sluices. This claim pays, on an average, \$800 to \$1000 in dividends monthly. The expense of working is comparatively light, as timber is plentiful in the neighborhood and as the mine's owners have their own reservoirs, ditches and water supply.

**THE MOUNTAINEER MINE.**—Transcript, June 20: It was reported some time ago and generally believed, that the Mountaineer mine near this city had closed down. The report is false. Operations are going right along as usual. There was a portion of the force let off at the time the rumor was current because all could not just then be economically worked, and that was all the foundation for the story. The Mountaineer has paid pretty good dividends, and will do it again.

**RICH ROCK FROM THE OMAHA.**—Grass Valley Union, June 20: Within the past two days some splendid quartz has been taken out of the Omaha on the south drift of the 600 level. It shows as richly in gold as any quartz found in the district in years, the gold being coarse and well distributed through the solid rock. The specimens brought to town have been much admired and commented upon as being among the finest ever seen here. The ledge from which these specimens came is strong in width and solid, and is a certain indication of the presence of a good pay-shoot. Fine milling rock is also being taken out of the north drift of the 600 level, which makes the outlook for the mine very encouraging.

## Placer.

**THE HATHAWAY MINE.**—Newcastle News, June 23: Early in the fifties a great amount of work was performed on what is now known as the Hathaway Mine, and a wooden stamp mill, the only kind then in use, was erected, and from what can be learned of the early history of the mine it was a paying property. The ledge, however, was what miners term "surface robbed," no effort being made to develop it to any depth. After many set-backs and repeated changes of ownership, it eventually became the property of James Butts, who has worked it off and on for ten or twelve years past, and crushed the ore in a five-stamp mill planted near the mine. Recently the Valentine Brothers, of San Francisco, secured a working bond on the property with the privilege of purchasing it provided explorations resulted satisfactorily. So far as this work has progressed very gratifying results have followed, and it is now deemed absolutely certain that the mine will again change hands and will be worked for all its worth. The ledge is strong and well defined, ranging in width from four to seven feet, and is what is known as a continuous ore body. The walls are perfect, being hard, smooth and regular, and it is said that the entire ledge from wall to wall will pay to work. Although carrying free gold in paying quantities, rich sulphurets are also generously distributed through the rock, all of which gives high assays in gold and silver. The ore will be worked for the free gold by a common stamp process, and concentrators will be employed to save the base metal. This will be shipped to chlorination works for reduction. Mr. Frank Guerra, a practical mining man is superintendent. A boarding and lodging house have been erected, and both will soon be ready for occupancy. A ten-stamp mill has been purchased, which will be put up as rapidly as circumstances will permit. The mill and hoisting works will both be run by water-power and the ledge being large the ore can be extracted and worked at a comparatively low figure. A main working double-compartment shaft is being driven on the ledge, a work that will be pushed until it reaches a depth of 100 feet below the tunnel level, and from which extensive explorations will be made.

## Shasta.

**LOWER SPRINGS.**—Cor. Shasta Courier, June 22: There is some report of White, of the White Oak mine, having sold out for a good price. Since the reduction works has been conducted by Mr. Conant and others, capitalists have been up this way, and will in a short time interest themselves in the actual merit of our mines. Two-thirds of the mines that are lying idle would pay a dividend if proper management was conducted upon them. The Kit Carson and Mountain mines are looking as well as usual. Kit Carson has an excellent shaft down upon the ledge a depth of 30 feet, with a big ledge at the bottom of the shaft.

## Sierra.

**GOLD BLUFF.**—Mt. Messenger, June 23: The large ledge that was so rich in the upper levels of the Gold Bluff quartz mine, at this place, has been reached in the lower tunnel. The workmen also tapped the upper workings, a few days ago, with the upraise, at a height of about 350 feet.

## Siskiyou.

**THE STEAMBOAT MINE.**—Yreka Union, June 20: The new pumping machinery at the Steamboat mine, McAdams creek, keeps the mine dry and in a short time gold-laden gravel will be running through the flumes. A new shaft is being sunk, and on Sunday had reached a depth of 86 feet. The mine felt into good hands when Mr. F. D. Frazier assumed charge. He has practically demonstrated that deep mines can be successfully worked, and other mines of this character will probably be opened soon.

**WATER.**—Yreka Journal, June 20: The recent rains have been beneficial to the miners in several localities, by furnishing sufficient water for ground sluicing and hydraulics, but the supply stops soon after each shower, as there is but little snow on the mountains to help out, as during the early spring months. The storm at Salmon river caused a sudden and heavy freshet in that stream, washing out Bigelow's flumes above and below Sawyer's Bar, and requiring the head-dam to be blown out. Some days since, at first commencement of the late storms, the head-dam was also blown out, and rebuilt, not expecting another heavy storm at this season. Several others carrying on operations in the river, also sustained more or less damage from the freshet. The Hamilton boys struck a rich ledge of quartz on the head of Humbug last week, below the old Eliza mine, which prospects about \$500 to the ton. There is plenty of rich quartz in the vicinity of the Eliza mine, as was proven when the Eliza mine was first opened,

but hard work and capital is needed to develop that rich quartz-mining district. Geo. Sinimons, an experienced miner from Arizona, is now following some stringers in efforts to strike the rich Cornish ledge, which pinched out some years ago. The widening of the seam and dripping of considerable water from same, are good indications of being near a vein of quartz. Other miners from Arizona are also prospecting in same vicinity, and consider Siskiyou one of the richest of virgin gold mining fields on the coast. Messrs. Bruce Aldrich and George Allen have also found a rich ledge on the North Fork of Humbug creek, which prospects very rich.

**ETNA NOTES.**—Cor. Yreka Journal, June 20: The Koon Nothing creek quartz mines in South Fork of Salmon district, continue to show great improvement, with new finds constantly reported. The Radefinger & Hansen ledge increases in size as the work progresses, and is now three feet wide, the quartz paying \$30 to the ton. The Loftus, Morris & Hansen Co. have purchased the arastra of Mr. Clark, and will start up crushing in a few days. It is rumored here that the Koon Nothing Co. have purchased the Cash mill, and are making arrangements to transport it to their mine. At Black Bear the elevated railway is completed, and in a few days more the incline will also be finished, which will prove a great saving in expenses, as the company will not require so much hay and grain to feed animals as at present. The Gold Ball Mining Co., or Mountain Laurel ledge, looks fine, at least so reported by the superintendent, Mr. Ball. The ledge is six feet wide, and keeps the eight-stamp mill running day and night, with the expectation that the quartz will pay \$30 a ton.

## Trinity.

**THE "HARDSCRABLE."**—Journal, June 23: Gruss, who has contracted to run a tunnel in on the Hardscrable mine, East Fork district, has progressed about 35 feet, after running 25 feet he came across hard rock, which makes progress slow. There remains about 120 feet more to be run to tap the vein. A 65-foot incline has been sunk in the ledge but work had to be stopped on account of water coming in. As soon as the tunnel is completed, the drainage facilities afforded by it will enable work to be pushed on the ledge. The quartz at the bottom of the incline is very rich, both in free gold and sulphurets. Assays of the sulphurets run from \$800 to \$1400 to the ton.

**MILL.**—Capt. Weaver of East Fork was in town to-day, and tells us that all the machinery for the mill on the Golden Chest, that has arrived, has been packed up to the Backbone, and will be taken to the mill site as soon as the trail now being built is finished. He expects the mill to be in working order by the middle of September.

## Tuolumne.

**POCKET MINE.**—Union Democrat, June 23: The pocket mine of Wm. Lewis on Bald Mountain continues to yield handsomely. A considerable amount of gold has been taken out reaching well up in the thousands, but the exact amount is not known. From Mr. Scott, whom we saw the early part of the week, we learn that a new and splendid chute of ore has been struck in the north drift of the Back Oak mine. It is fully equal to any development heretofore.

## NEVADA.

## Washoe District.

**LADY WASHINGTON.**—Virginia Enterprise, June 23: The crosscuts at points 110 and 210 feet above the 725 level are in a promising formation of quartz, clay and porphyry. Work on the Keystone shaft has been discontinued.

**KEYES.**—The usual prospecting work is in progress.

**BULLION.**—Drifting south from winze bottom on 640 level.

**IOWA.**—The south drift from the east drift is in hard vein porphyry.

**OVERMAN.**—The shipments of ore amount to about 300 tons a week.

**ALPHA.**—The work of sinking the shaft to the 500 level is progressing finely.

**SEG. BELCHER.**—The east drift on the 1300 level shows no change of formation.

**CON. IMPERIAL.**—The work of retimbering the main north lateral drift is still continued.

**ANDES.**—Sinking a winze below the 240 level north drift, and drifting south on the 350 level.

**OPHIR.**—Ore of milling value is being extracted from the raise that is being made about the 1465 level.

**MEXICAN.**—East crosscut No. 1 from the main north drift on the 1300 level continues in vein porphyry.

**ALTA.**—Ore is being extracted from the usual points and the mill and concentrators are kept steadily running.

**BENTON.**—This mine is being prospected through the Alta shaft. The work is confined to explorations on the 725 level.

**UTAH.**—372 level: Opposite the south drift the north drift has been extended 40 feet; total, 78 feet. The formation is vein porphyry.

**BALTIMORE.**—Good progress is making in the work of cleaning out the west drifts on the 300 level. It is expected that ore will be reached in a few days.

**CROWN POINT.**—On the 600 level the raise still continues in ore of fair grade. The southeast drift on the 700 level cut several promising seams of ore.

**SIERRA NEVADA.**—The face of the south drift on the 500 level continues in vein material composed of quartz, clay and porphyry. Some water is still coming in at the face of the drift.

**WEST YELLOW JACKET.**—Streaks of ore are coming in at the bottom of the drift. It is expected that the whole face of the drift will shortly be in ore. The formation is becoming softer.

**BELCHER.**—Good headway is making in the east crosscut on the 500 level. The east drift on the 1300 level still continues in quartz. The new hoisting works at the shaft are going up rapidly.

**OCCIDENTAL.**—In the winze leading to the lower levels, 50 feet below the lower tunnel, are cutting out a station. Have extracted 62 tons of ore. Shipped to the Atlanta mill 142 tons of ore. Average assay

of wagon sample, \$23. Shipped to Excelsior mill 177 tons of ore. Average assay of wagon sample, \$22.

**BEST AND BELCHER.**—El Dorado level: The northwest drift from the main west drift has been extended 40 feet; total, 290 feet. The formation is clay and quartz, showing some value by assay.

**GOULD AND CURRY.**—During the week there has been extracted from the 250 and 300 levels and shipped to the Douglass mill 228 tons and 1000 pounds of ore. Average battery assays, \$24.03.

**UNION CONSOLIDATED.**—Crosscut No. 1 from the main north east drift on the 1300 level is still in porphyry. The north drift from west crosscut No. 2 is being advanced into quartz that is beginning to show metal.

**CHALLENGE.**—The joint Yellow Jacket south drift on the 1000 level has connected with the north drift on the same level. The raise jointly with the Confidence is making the usual progress, as also is the north drift on the 1000 level.

**DEXTER.**—This mine is located west of the Iowa and north of the old Virginia sidonia. It contains 1200 feet and runs north to and across Cedar ravine. It is being reopened through a tunnel and shows ore assaying \$30 a ton in silver and gold, silver predominating.

**CONFIDENCE.**—Are shipping to the Brunswick mill for reduction 185 tons of ore daily, the average battery sample of which shows a value of \$26.30 per ton. The mine shipped 6 bars of bullion, valued at \$18,094.48 on June 19th, making a total for the month to that date of \$68,701.28.

**HALE AND NORCROSS.**—Are extracting about 1500 tons of ore from the 600 and 700 levels, which is being shipped to the Mexican and Nevada mills. The average assay is \$33.50. All the stopes are looking and yielding well. Work has been resumed on the 400 level. They have bullion on hand and previously shipped on June account to the value of \$96,000.

**CON. CAL. & VIRGINIA.**—Good milling ore continues to be extracted from the stopes below the 1435 level. The 1500 level upraise is in fine ore and the west crosscut on the same level is in quartz which is beginning to show a considerable amount of metal. On the 1600 level ore of good grade is being extracted from the stopes around upraises Nos. 1 and 2. The south-west drift on the 1650 level is still in a mixture of porphyry and quartz. The usual quantity of ore has been shipped to the river mills and the average assays will be about the same as last week. A bullion shipment of 16 bars, valued at \$65,000, was made to San Francisco from the Con. Cal. Virginia office last Thursday evening.

**SAVAGE.**—On the 500 level the main west drift from the shaft passed through a body of ore 45 feet in width. In the center of this drift was started south, which is now out 50 feet, all the way in good milling ore. The ore is found to increase in richness as the deposit is followed southward. The car samples average \$35 a ton, but much richer ore is found in places in the main mass. On the 400 level the stopes on the north and south drifts continue to look and yield well. The car samples of this section average from \$33 to \$35 a ton. About 80 tons of ore a day are sent to the Rock Point mill below Dayton, on the Carson river. Thus far they have taken out about \$16,000 this month.

## Tuscarora District.

**DEL MONTE.**—Times-Review, June 22: Crosscut north from the tunnel has been extended 35 feet, passing through some vein matter.

**BELLE ISLE.**—The grade of ore from the old stope shows some improvement.

**GRAND PRIZE.**—The face of the east drift 200-foot level, has been advanced 14 feet, and showing good ore in the face.

**NORTH COMMONWEALTH.**—West crosscut from the first level, in prospect shaft, has been extended 35 feet, cutting seams of good ore.

**NAVAJO QUEEN.**—Northeast drift, 200-foot level, advanced 10 feet. Rock much harder. Face in ledge matter and seams of ore and spar.

**NAVAJO.**—South drift from No. 1 winze, east vein, 250-foot level, has been extended 25 feet. The vein is showing some good ore at this point.

**FOUND TREASURE.**—Crosscut No. 2 has been stopped to permit the water, which is now decreasing, to drain off. Upraise just southeast of the shaft on northwest vein has been carried up 20 feet. The ore seam is from 18 to 36 inches in thickness, but the ore is too low-grade to pay to ship, so it is being saved to concentrate.

**NORTH BELLE ISLE.**—Four hundred-foot level north has been extended 13 feet. The whole face of the drift is in ore of a medium grade. No. 1 winze from the 300-foot level has been sunk 11 feet the past week, and is looking more favorable. On the upper levels some high-grade ore is being extracted, and considerable retimbering is being done to protect the openings.

**NEVADA QUEEN.**—The work of putting the mine in shape to extract ore for the mill is progressing very favorably, as in extending the stopes on the 350-foot level, the ore continues much further than was indicated when the level was run; the ore is not so wide going north, but is very high-grade; south of crosscut it is 5 feet thick. One hundred tons of ore hoisted during the week from the various workings average assay \$220 per ton.

**COMMONWEALTH.**—The No. 1 east crosscut from No. 1 south drift has been extended 13 feet, and is cutting the same character of ore as in the 150-foot level south; assay yesterday, \$205 per ton. On the 150-foot level east crosscut from north drift has been extended 17 feet, and is encountering more water in the face. North intermediate is still showing good ore in the face. The 150-foot south drift has reached the Queen line and is still showing well. Four tons were taken from the face, about 5 feet wide, just as broken out, and sent to the mill; pulp assay from the battery, \$206.75 per ton, and worked to 93 per cent. Parties are preparing plans and specifications for the construction of the 20-stamp mill in the interest of the Queen and Commonwealth Co's.

## Tybo District.

**RUNNING STEADILY.**—Belmont Courier, June 16: Judge George Turin writes us that the Nye company's mill is running steadily, and bullion is being shipped regularly. Dimick shipped 22 tons of lead ore to Eureka on the 4th of June, and he delivered

the week previous 50 tons of second-class ore to the Tybo mill. The Ma Alta mine improves as depth is gained. A vein of fine ore has just been uncovered in the deepest workings of the mine. The outlook of Tybo is bright.

#### Jefferson District.

**OUTLOOK BRIGHT.**—Belmont *Courier*, June 16: We learn from James Bryson that the outlook at Jefferson is bright. Kanrohat's mill is running on ore from the Union and other mines, and the new roaster is in full operation. The Nelson brothers have struck some good ore, which is being reduced in the Kanrohat mill. The Harrison brothers have started up their mill on ore from their mine, and have made a hullion shipment. Messrs. Hancock, Cubbins and Bryson are working in the Jefferson mine and taking out some very rich ore. E. Frank Corille is extracting good ore from his mine; his second-class is reduced in the Kanrohat mill. The water supply is plentiful.

#### Eureka District.

**ORE SHIPMENTS.**—*Sentinel*, June 23: The following number of tons of ore were shipped from the mines of the district to the furnaces during the week: Featherstone, 3½ tons; White Pine, 18½ tons; Charlotte, 8½ tons; Williamsburg, 6½ tons; Dunderburg, 82 tons; Revelle, 5 tons; Morey, 9 tons; Little Risk, 8½ tons and Bulwhacker, 4½ tons. From the Leone, 10 tons, and Woodchopper, 22 tons.

#### Aurora District.

**REDUCTION WORKS AND ORE.**—*Esmeralda News*, June 23: During the last week a syndicate of English moneyed men, largely interested in this once prosperous camp, have purchased more mines and intend working them for all that is in them. They have purchased from L. Ravenelle, on the Walker river near the mouth of Rough creek, a tract of land for the purpose of erecting thereon large reduction works, suitable to work the immense quantity of ore around Aurora. In a short time the work of constructing the mill will be commenced and prosecuted with vigor, and when completed will be one of the largest and best equipped works of the kind on the Pacific Coast. It will be of the most modern improvement, with a view of economically handling large quantities of low grade ore. This mill will be within 16 miles of Aurora, and will be propelled by water-power. There is at present a good wagon road from the principal mines. The future of Aurora is now assured: Owing to matters incident to a prosperous mining camp, Aurora for many years has had a set back. At the present writing, the old camp is far from being dead, for there are from 50 to 60 men employed in and about the mines and mills and there is not an idle man to be seen on the street. As soon as the ledge is tapped in the Antelope, which is expected at any moment and may have been accomplished ere this, the Silver Hill mill will be put in operation, when a much larger force of men will necessarily be needed. The hoisting works on the Durand, one of the principal mines, has been completed and everything in and about the mine is working smoothly, and large quantities of ore are being extracted. The rich body of ore uncovered some time ago continues to hold out, and the more work that is done on the ledge the richer it gets. H. G. Blasdel and a number of other mine owners in the district are having surveys made preparatory to making applications for patents. Messrs. Colcord and Ann, while at San Francisco last month, purchased the machinery and other articles necessary for the erection of the reduction works on Walker river, and the same, it is said, is now on the road to the proposed mill site. It is certain that there will be no delay in the building of this new mill. The Antelope, though working under adverse circumstances, produced \$2,145.81 during the year 1887. Now, that it has been consolidated with the Silver Hill and everything is in the best of working shape, it is safe to predict that its bullion production for this year will almost double that of last year's record. By men well informed, it is estimated that 250 men will be laboring in the Aurora mines and mills within the next two months.

#### Grantville District.

**HOPEFUL.**—Belmont *Courier*, June 23: It is said that Grantville will soon see a mining boom. If the Horn Silver people sink a big shaft in the Alexander, they will open a mine that will make a big stir in Eastern mining circles. The bottom of the incline in this mine was in ore when orders came to shut down, and the ore stops were all looking well and producing sufficient good ore to keep the fine 40-stamp mill running steadily. The Horn Silver Company has a fine property in the Alexander, Brooklyn, Lloyd, Alameda, Cooper and adjacent mines.

#### San Antonio District.

**LEACHING.**—Belmont *Courier*, June 23: A. B. Eastwood is running his leaching works on chloride ore from the New Year mine. He is shipping the sulphides to San Francisco for treatment.

#### Ophir Canyon District.

**CHICAGO COMPANY.**—Belmont *Courier*, June 23: Work is progressing steadily in the Chicago Mining and Reduction Co.'s mine, Ophir canyon. The number of men at present employed is not large, but it is being gradually increased as developments justify.

#### Spanish Belt District.

**PRODUCING.**—Belmont *Courier*, June 23: The Barcelona mine of Spanish Belt continues to look well and produce its usual quantity of good ore. The concentrators in the Monitor-Belmont mill are running steadily on the low-grade ores and doing very satisfactory work. When the Barcelona is properly opened by a straight shaft it will show immense bodies of fine ore below water. It gives every indication of being one of the most extensive mines ever worked on the coast, and money expended in erecting hoisting works to sink a large shaft for the proper working of the mine will be returned a thousandfold in handsome dividends to the stockholders. The Barcelona is no baby mine. All mining men of known experience pronounce it the equal of any mine ever discovered. Its high-grade ores are rich in gold, silver and the baser metals; streaks of cinnabar are frequent. There is only one other mine in the world whose ore carry gold, silver and quicksilver—the famous Potosi mine of South America which has been successfully worked for upward of 300 years and has produced upward of \$1,000,000,000 in the precious metals. The Barcelona will do the same in less time if it is properly opened and worked. The biggest ore

bodies in it are below the tunnel level. The concentrates and high-grade ores are shipped to Salt Lake for treatment.

#### ARIZONA.

**NOTES.**—Prescott *Courier*, June 20: Machinery will soon be moved out to Copper Bisn. Frank Kuhne's mine, near the Sterling, is yielding rich ore. He recently shipped about 10 tons. Harlan & Harrington are driving a crosscut toward the Howard mine. They think they are near the vein. Lawler & Riggs have just shipped 10 tons from the Hillside. Another new strike was made in Dan O'Boyle's Montgomery mine a few days ago. It is a vein of 15 inches thickness that assays from \$150 to \$200 a ton in gold. Dan and his miners are now admiring the rich stuff. It was found 125 feet below the surface. Jas Allen was at the Etta mill a couple of days ago. It was doing good work. Plates looked well. E. S. Junior brought in five specimens of silver ore for Mr. F. W. Blake's cabinet. They are from the Conger, Eclipse and other mines. Richer ore would be hard to find. Rowe Bros. from Haysampa district give encouraging news. Mr. Kerr's mill at Antelope, is crushing Grey Devil mine ore, and Jas. M. Vand-burg says the mine is yielding like its namesake. Mr. Kerr will enlarge the mill. Wagons, with ore from the Boggs, Amulet, Conger, Hillside and other mines arrived yesterday at the sampling works.

**RICH MINES.**—Florence *Enterprise*, June 23: The Southern Pacific and Atlantic silver mines, adjoining each other in the Casa Grande district, 20 miles south of the railroad, are now proving themselves the richest properties of the district. The most thorough expert has examined these properties and the shipping record shows what the mines are capable of doing. From what can be learned it appears that large capital will test these estimable properties and from what the *Enterprise* has seen and knows of this A. No. 1 property, it would not be prophesying much from the mark when it is asserted that it will command a very large sum in any market, as 10,000 tons are represented to be showing up and it is an ore that runs very high.

#### COLORADO.

**SMELTER.**—Elk Mt. *Pilot*, June 22: We shall always believe that Crested Butte would be an excellent place for a smelter, simplifying works or some kind of an ore market. There are many locations here that would ship a little ore just for a starter in order to see how it would run if there was some place here to sell the ore and have it tested. Crested Butte is favored with many advantages over any other point. It is the shipping point for a vast section of country embracing a semi circle extending for over 20 miles and in this territory will be when it gets opened up one of the richest ore producing sections in the State. Other advantages are that we have coal, coke, timber and water as well as a great variety of ores to draw upon. The very best flinging ores are found here in sufficient quantity to run a smelter.

**NON-RESIDENT OWNERS.**—We regret to see so little mining done at this season of the year. What is the matter? We know that the mines are here and it is simply for the want of a disposition on the part of the mine owners. The most of our best mines are owned by non-residents, who have made some foolish blunder at some time or other, and simply quit in disgust. They will not work these properties themselves nor allow others to do so. There are a number of properties that would be worked under a lease if the owners would only permit. We can name over a dozen claims in the Irwin district alone that have produced good ore at some time and still have ore in sight that miners would be only too glad to leave on terms at least insuring the pay of wages if the owners would only lease them.

**YIELD OF GOLD.**—Denver *Republican*, June 20: Gold-lode and placer-mining in Colorado is greatly on the increase, and the mines of this State through their natural production promise to contribute much toward the existing inequality between silver and gold. Everywhere new gold mines are being opened, and reference need only be had to Government statistics to show that at the present rate of increase silver will soon command a premium. At Leadville the amount of gold contained in the ore produced is gaining annually, and there is now little ore taken out that does not contain some of the yellow metal. In addition to this, auriferous lodes have been opened in the great Carbonate camp, and 100 or more of stamps are pounding away on gold rock. Breckenridge and Gilpin are also improving in the production of gold. But the great gain this year promises to come from placer mines, which heretofore have been largely neglected, but which are again coming into popular favor. Not only will the reliable placers along the Blue river, the north fork of the Platt, Clear creek and the upper Arkansas produce more gold than usual this year, but the San Miguel river placers will come forward with very extensive yields. The great results which are expected from the San Miguel canyon promise to stimulate placer washing and resuscitate this almost obsolete branch of mining in Colorado. With its re-establishment many other valuable sections will be opened, notably the Hahn's Peak country, well known to old-time gulch miners as containing some of the largest and richest beds of auriferous gravel to be found anywhere in the world.

#### DAKOTA.

**FLOAT.**—Deadwood *Pioneer*, June 20: It is stated that negotiations are now pending which will lead to the starting up of the Garden City or Snyder stamp-mill, by Central City parties, within the next two months. Developments at mines in the neighborhood have been flattering, and enough ore is now in sight and available to keep the plant busy an indefinite length of time. Samuel Moll, lessee of the Hartsfeld smelter, expects to start the plant in about 30 days. The Bullion will furnish a quantity of ore, as will also the Merritt and Silver Queen.

#### IDAHO.

**EXCITEMENT.**—Silver City *Avalanche*, June 20: There is now quite an excitement over a lode recently discovered near the old Antoine lode at the head of Reynolds creek, to the left of the road com-

ing to Silver City. Mr. Rice, better known as the "Democrat," re-located the Antoine lode some time since, and from specimens of the ore exhibited to a man called "Tuscarora," the latter was induced to go to that neighborhood to prospect. It was but a short time until he found float, and then the lode, being near the Antoine, and carrying the same character of ore. Those who have seen the ore say that it is base, but rich. There is no doubt that this lode will prove valuable, as well as the old Antoine, which is thought to be the mother lode of that section. Supt. Howe of the Proustite Mining Co. reported the winze now being sunk on the Henrietta mine, Wagontown, down about 75 feet and in good ore. The Henrietta shaft will soon be 400 feet deep, the deepest in Wagontown, proving that the lodes in that place go down and grow larger, and retain their richness as depth is attained.

**THE NARROW GAUGES.**—Wood River *Times*, June 20: John A. Wilson, superintendent of the Narrow Gauge group of mines, who spent the past winter on his ranch, a few miles south of Hailey, has moved up to Deer creek, in order to resume operations in the Narrow Gauge mines and concentrating works. He thinks that the ore already extracted will keep the concentrating works running most of the season; and he intends to put men to work in the mines in a few days.

**FOUR FEET.**—Wood River *Times*, June 20: News comes from Broadford to-day of a new strike which has just been made almost in the very grass-roots on the Relief mine, at that place. A few days ago men were set to work sinking a new shaft to connect with the old workings and secure a main working opening. After attaining a depth of 16 feet they blasted into a body of high-grade steel-gray galena, which at noon to-day showed a width of four feet. As this strike was quite unexpected, it is hailed as an evidence of the correctness of the theory entertained by all miners, to wit: That this region has not even been as much as surface-scratched.

**ORO FINO.**—*Idaho Avalanche*, June 23: Mr. Leech, the superintendent of the Oro Fino, has had the mine pumped out and is now preparing for vigorous work on this great property. The machinery has all been put in thorough repair; several hundred feet of T rail track has been delivered on the ground; contracts made for a year's supply of wood and timbers, and a large amount of lumber ordered for other improvements. Mr. Leech expects to begin in a few days sinking the main shaft 100 feet deeper, and will, at the same time, drive the third level south to tap the big chute of ore which yielded the former owner, from the upper levels, a fortune two years ago. It is also proposed to begin mining the \$30 ore, left in former workings, because under the old regime \$30 ore did not pay for milling. Much of this will be added to the 2000 or 3000 tons of similar ore now on the dump. Arrangements have been made with one of the mills in town, by which experimental machinery will soon be put in to test the economical working of the ores.

#### MONTANA.

**THE HELENA SMELTER.**—Mining *Review*, June 20: As announced last week in the *Review*, three days in advance of the city dailies, Helena's great smelter will be built on the east side of the city, about five miles distant, and a little more than a mile south of the mouth of McClellan gulch. The smelter company have at the point selected a tract of land embracing about 1000 acres. The building of the Helena smelter means the reduction of ores at a cost not exceeding \$11 per ton—and perhaps somewhat lower. This of itself will be a long step in advance. It is but a few years since \$20 and \$25 per ton was considered a very low figure. It also means the development of hundreds of mines and the discovery of hundreds of others.

**ORO FINO DISTRICT.**—*New Northwest*, June 23: The news from the mines in Oro Fino district this week shows that work is going on steadily and with satisfactory results on the Lion, Champion and Franklin properties. Last week the Champion shaft had reached a depth of about 100 feet, and some good stringers of ore have shown up. At a meeting of the trustees it was decided to let a contract for the next hundred feet, and the same was taken by McBride & Co. at \$30 per foot. The contractors put in a Knowles pump, the old one not handling the water satisfactorily, and work is now going on in the shaft. The Franklin Co. has made good progress on the Jumbo, and ore has already been struck in the tunnel. Their prospects are very encouraging. On the Mountain Lion a contract has been let to Griffith Jones for the next 50 feet, at \$9 per foot, the company furnishing the timbers. There is now over 800 feet of tunneling, crosscuts, upraise and stopes on the property, and the condition Wednesday was regarded by Manager McMaster more favorable than at any preceding time. The tunnel is now in the neighborhood of 200 feet vertical depth and approaching closely where the solid ore body is expected on that level, having cut through the apex of several good ore shoots in its shallower workings. There is now 30 inches of high-grade ore in the face of the tunnel in a solid body, and seven feet altogether of good-looking ore. None has yet been assayed. The 50 feet contracted for is expected to carry the head under the heavy ore shoot that crops on the surface.

#### NEW MEXICO.

**WATER SCARCE.**—Silver City *Enterprise*, June 22: The hanging up of the stamps of the Deep Down mill at Pinos Altos, which was found necessary owing to the scarcity of water, seems to have caused considerable uneasiness with St. Louis stockholders. From the best and most reliable information which the *Enterprise* has been able to obtain, the mine is undoubtedly in better shape than ever before. The Wagner lead especially, is making a splendid showing, and with a little more development this lead alone will be able to supply the mill with ore. The Deep Down vein has been continuous from the surface to the present depth of the working shaft, and also to the face of the drifts which have been run each way on the lead. There is no occasion for uneasiness. It is unfortunate indeed, that a scarcity of water should occur just as the mill was being started, but it is much better to suffer a delay from that source than to be short of ore. The scarcity of water will be only for a few weeks, during the dry spell, after which everything will move along as was originally anticipated. In the mean time the mine

is being developed, and will be in a good shape by the time the mill is ready to run. The mine has lost nothing by the temporary shut down of the mill. Quite a ripple of excitement was created in this city during the early days of this week by the arrival in town of Pat Murthy, a prospector, with several ounces of coarse gold which he claimed to have washed out of a gulch on the head of Cherry creek, in the Pinos Altos range. Pat bought a large bill of grub, steel, etc., picked it out on burros, and during the night quietly stole away. Before going he stated that he had discovered the richest placers on the continent, having washed out two ounces of good gold in three hours.

**KINGSTON NOTES.**—*Shift*, June 20: The Iconoclast is sinking and developing with the new hoister. The Ingersoll is again at work with a force of men, and sinking. About 25 men are at work on the Lower North Percha. The Hiatt is closed down, preparing to form a new company. Tierra Blanco is quite a camp. Over 60 men are at work out there. Jno. S. McDonald is superintending a force of men on Tierra Blanco. Richer ore than ever has been struck on the Long Cabin at Tierra Blanco. The Lady Franklin is again sinking after a week spent in adjusting machinery. The Superior awaits the results of the Lady Franklin deep down workings. The deep down shaft of the Lady Franklin has passed the 400 foot level. Down they go with ore in sight all the way. The Butte boys still hold the fort. They have a shaft 85 feet in porphyry, 25 feet from the Black Colt line, and are preparing to put on a steam hoister to take out the water, and ore, when struck, which is dipping toward them from the Black Colt and Lady Franklin.

#### OREGON.

**KEYSTONE.**—Bedrock *Democrat*, June 18: Richard Hill, foreman of the Keystone mine, near Prairie City, Grant county, owned by Watson, Failing & Ladd, of Portland, is on a business trip to the city. He informs the reporter that work in the mine is progressing finely in the hands of a large force of miners. The mill is running night and day and the ore is giving good results. Other properties in the vicinity are developing in splendid shape, and the camp bids fair to become a very prominent mining center.

**THE NORTH POLE MINE.**—Mr. John Williams, superintendent of the North Pole mine on Cracker creek, is in the city for the purpose of meeting the recent buyers of the mine. Mr. Williams left a force of miners busily engaged making developments on the North Pole, and will be able to show its owners one of the best prospects on the coast on their arrival in what is now admitted to be one of the greatest mineral countries in the world.

**ANOTHER RICH STRIKE.**—News of another rich strike comes from the Henry Cable mine at Cracker creek, which is bonded to Eastern parties for the sum of \$80,000. Henry Cable has been diligently at work developing the property, and the other day opened out a vein of ore that is so rich that he will sack nearly a carload for shipment to Salt Lake for reduction. It will yield him over \$500 to the ton.

#### UTAH.

**REVIEW.**—Salt Lake *Tribune*, June 23: The week has been a dull one; the illegal importations of Mexican ores is having a deadening effect upon the mining industries of this Territory. There is no profit in the ordinary run of lead and silver ores; worse yet, ores that have heretofore sold well and have been considered first-class, afford so little margin to the owners as to be startling. The situation is serious, and unless relief comes the lead product is bound to be seriously diminished, and with it the product of silver. The receipts in this city for the week ending June 20th, inclusive, were \$71,976.19 in bullion and \$40,794.28 in ore, a total of \$112,770.47. For the week previous they were \$116,030.53, of which \$79,365.83 was bullion and \$36,664.70 was ore. The Ontario output for week was \$71,575.45 from ore sales and of bullion 20,138.26 fine ounces, an approximate total of \$31,713.71. The Daly product for the week was of ore \$7688.92; of bullion, 11,556.78 fine ounces; a total, approximately, of \$13,345.70. The Horn Silver makes no local showing for the week; it probably sold no ore, and raised but little. Fine bar receipts in this city for the week were to the value of \$33,837; base bullion, \$16,366.22. The Hanauer smelter produced during the week bullion valued at \$14,400; the Germania, \$7312.97. Ore receipts in this city were to the value of \$19,263.92 by Wells, Fargo & Co.; \$16,900 by McCormick & Co.; and \$4630.36 by T. R. Jones & Co.

**PARK NOTES.**—*Record*, June 23: The Massachusetts hoisting works were closed down Wednesday for a few days. Superintendent Curtis went down to Salt Lake for an air compressor, and soon it will be put in place, followed by Burleigh drills. The shaft is down to the 600-foot level and a fine station has been made there. A few feet of drifting has been done, but the developments will be made very rapidly when the new machinery gets into thorough working order. Last week he settled up with the Wilson Brothers who have been sinking a shaft by contract on the Dolberg group, between the Morgan and the Anchor. A second contract was let to the Wilsons to run a 200-foot tunnel on the opposite side of the gulch. The shaft is down about 60 feet and there is a fine seam of ore worth going down on. Owing to its proximity to the lake the water handicaps operations at present. Judge Smith feels confident that the Dolberg group will ultimately be a rich, productive property and he is to be congratulated on his prospects.

**A NEW STRIKE ON PIONEER RIDGE.**—Ore has been found in the old Pioneer patented ground, farther west than any point where it has been opened before. The ore goes over three hundred ounces to the ton in silver and 40 per cent lead.

#### WYOMING.

**COAL.**—Deadwood *Pioneer*, June 20: A good deal of talk has been recently heard regarding the Wyoming coal fields. Several local parties are interested in locations therein, and propose to push developments during the summer. It is claimed that the mineral is there in inexhaustible quantities and that it makes most excellent fuel, is free from sulphur and cokes well.

— THE —  
DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

**AN AUTOMATIC ORE FEEDER**  
Goes with each Mill. We also have a suitable  
**Rock Breaker.**

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to supersede the old stamp in mills of the largest capacity.

**TATUM & BOWEN,**  
34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.  
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

**THE RAND DRILL COMPANY.**  
23 PARK PLACE, NEW YORK,

Are now so situated with their new works as to offer to the miners of the Pacific Coast small Air Compressing Plants at such prices that almost any small mine can afford to put in power drills if they have none in use.

By their new and patented systems (by which the duty or performance of drills is not reduced with use) it is no longer necessary to buy a Compressor of double capacity than the drills are expected to require, in order to keep up the supply of air necessary on account of the wear of drills and compressor.

Besides having the newest and lightest designed small drill plants, the Rand Drill Company, as is well known, has built, and is now building, the largest Compressor plants in this country, and has patterns for all sizes up to 40 inch diameter of cylinder.

In respect to capacity in speed of drilling, perhaps it is in order to say that in every authoritative contest for speed yet initiated, the Rand Drills have, without exception, been victorious. This fact, coupled with another important one, that the drills use much less air and cause less repairs, has won for them nearly all of the Eastern mining trade, which has kept their works always busy.

Since the reasons which formerly restrained them from the California market no longer exist, they are now in this field for the business.

SPECIAL ATTENTION is called to the latest designed sectional Compressor just built for the Batopilas mine in Mexico, and to the Compound Engine Compressor now being built for the Anaconda mine in Montana.

 384,940.—PHOTOGRAPHIC CAMERA—H. Swain, S. F.  
 384,941.—STEAM GENERATOR—E. H. Thompson, Newark, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect accuracy, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

GAME-COUNTER.—Frank G. Nash, S. F., No. 384,707. Dated June 19, 1888. This is a device for scoring games, especially cribbage. The invention consists in a plate having one or more longitudinal slots with short cross-slots opening out from each side thereof, and on double-headed pegs fitted and adapted to be moved on the slots. The object is to provide a cribbage-board with the pegs so arranged that they cannot be disconnected and so that all danger of misplacement or loss is avoided.

DISK CULTIVATOR AND SEEDER.—B. C. Dorsey, Tulare, assignor of one-half to Wm. L. Morrow, S. Luis Ohio. No. 384,748. Dated June 19, 1888. This invention relates to that class of disk cultivators and seeders represented by patent No. 344,950, issued to the same inventor July 6, 1886, and in which an implement is shown having peculiarly arranged and adjustable disk gangs carried by a wheeled frame. This disk cultivator and seeder consists of a frame made of longitudinal and transverse bars, carrying the wheels on each side and located at diagonally opposite corners, the oppositely inclined bars pivoted to the sides of the frame, the lever and connections for carrying and fixing the inclination of the bars, the shafts supported from standards carried by the inclined bars, and the disk gangs carried by the shafts, said gangs having smaller and less concave disks on each end, and the cleaning spikes projecting downwardly from the inclined bars and between the disks.

PUMPS.—John A. Murray, Tucson, A. T. No. 384,706. Dated June 19, 1888. In opening the valves in this pump, turn on their hinge-lines toward the center, so that in discharging they give room for the passage of the water. In the operation of the pump the lower piston or plunger takes the place, when acting as a double-acting pump, of the ordinary check-valve. The two plungers or pistons are auxiliary; but at the same time either one can be stopped or held stationary and not interfere with the working of the pump, except as to the quantity of work performed. In order to prevent the rods from becoming unscrewed and lost, when many lengths are used, as in deep wells, the rods of the lower piston have left-hand threads while those of the upper piston have right-hand threads. The lower piston is made flat where it passes through the upper piston-valve which prevents its turning and gives more room for water to pass. The arms or wrist-pins to which the crank-rods also connect, prevent the piston-rods from turning. The discharge takes place through a spout at the top of the pump cylinder, and is continuous while the pump is in motion. By having the crank-shaft journaled in the manner this is, and below the top of the cylinder, it leaves the upper end and discharge free and unimpeded, and it also enables the operator to work it conveniently either by hand or power as may be desired.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:  
 Mount Diablo, June 22, \$13,795; Con. California and Virginia, 22, \$73,791; Confidence, 22, \$18,094 (total for June account, \$68,701); Savage, 22, \$12,700; Standard Con., 22, \$7422; Eureka Co., 22, \$4007; Savage, 24, \$16,000; Hale and Norcross, 22, \$96,000; North Belle Isle, 26, \$41,430; Alce, 19, \$80,000; Blue Bird, 19, \$11,636; Silver Bow, 19, \$13,236; Lexington, 19, \$27,280; Germania, 19, \$3137; Hanauer, 19, \$3500; Germania, 26, \$1162; Hanauer, 20, \$1800; Germania, 20, \$1458; Hanauer, 21, \$2260; Queen of the Hills, 22, \$900; Germania, 22, \$1366; Crescent, 23, \$5150.

SOME miners are working what they think is a quicksilver mine, near Edwards' bridge, Nevada county.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco: WASHINGTON CEMENT GRAVEL M. Co., June 20. Location, the Daisy Cement Co.'s claim, Washington township, Nevada county, Cal. Capital stock, \$20,000. Directors, Robert T. Roberts, Hugh J. Owen, H. Jones, Matthew H. Nixon and John Morris.

JACOB STRAHLE SLATE CO., June 20. Object, to mine, deliver, bundle and deal in every kind and quality of slate, the product of California or Scotland or of any other State or country. Capital stock, \$300,000. Directors, Jacob Strahle, George Holloway, Harry Pauls, Frank D. Culver, Gustav Behrend, Joseph Kutner and William E. Shepman.

GLENDALE CANNING CO., June 20. Capital stock, \$100,000. Directors, E. Ransome, A. J. Gove, F. C. de Long, G. E. Chittenden and J. B. McKee.

GOLDEN GATE AUTOMATIC STREET AND STATION INDICATOR CO., June 26. Directors—John Kueffer, Emil Lommatzsch, Henry Freytag, Theodore Bacigalupi, Frank Van Denter, Henry G. Krasky and Josiah White.

ELECTRIC IMPROVEMENT CO., June 21. Capital stock, \$5,000,000. Directors—Frank Buttermoth, A. J. Bowie, Jr., Louis T. Haggin, Henry C. Drager, F. W. Sharon, W. H. Howard and J. B. Randol.

## Mining Share Market.

What fluctuations occur in the stock market in these days are very small indeed. More is bought now of a 25 per cent rise than used to be the case with a 25 cent one. The mines on the Comstock are producing ore and yielding hullion more than has been the case for years.

As regards the outlook on the lode, it has never been better. All the leading mines have large bodies of ore in sight and new developments are constantly being made. The Savage is now showing up a good body of ore 45 feet in width on the 500 level.

Good developments are being made in the north-end mines, and the milling situation is better than for some years past. There is no reason why a good trading market should not be seen as soon as brokers and dealers get their heads somewhat cleared of political cobwebs and their stomachs of the debris of the celebration of the National holiday.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send once but worthy men.  
 JOHN O. H. LAMPADES—Ventura Co.  
 G. W. INGALLS—Arizona Territory.  
 A. F. JEWETT—Tulare Co.  
 C. E. WILLIAMS—Yuba and Sutter Co.'s.  
 R. G. HUSTON—Montana Territory.  
 WM. WILKINSON—Butte and Tehama Co.'s.  
 W. W. THORALDS—Sonoma, Napa and Yolo Co.'s.  
 F. B. LOGAN—Placer Co. and Nevada State.  
 S. L. FLETCHER—Santa Barbara, Los Angeles and San Diego Co.'s.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, term of subscription, and give it their own patronage, and as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

J. A. JOHNSON, 307 Montgomery street (the Nevada Bank building) is the general agent of the Siles quartz machinery, and offers easy terms for introduction.

## DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION, 532 California St., cor. Webb.—For the half year ending with 30th June, 1888, a dividend has been declared at the rate of four and one-half (4½) per cent per annum on term deposits, and three and three-fourths (3¾) per cent per annum on ordinary deposits, free of taxes, payable on and after Monday, 2d July, 1888.

LOVELL WHITE, Cashier.

## DIVIDEND NOTICE.

THE GERMAN SAVINGS AND LOAN Society, 526 California St.—For the half year ending June 30, 1888, a dividend has been declared at the rate of four and one-half (4½) per cent per annum on term deposits, and three and three-quarters (3¾) per cent per annum on ordinary deposits. Payable on and after Monday, July 2, 1888.

WM. HERRMANN, Secretary.

## HEALD'S

## BUSINESS COLLEGE,

24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business, for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State.

SEND FOR CIRCULAR.

E. P. HEALD, President.

C. S. HALEY, Secretary.

THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

## WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families  
HOT AND COLD BATHS FREE.

Terms, Rooms and Room, \$1.00 per Day  
Add upward.

ROOMS WITH OR WITHOUT BOARD.  
FREE COACH TO THE HOUSE.  
J. POOLEY.

## THE ROLLER ORE FEEDER

(Patented May 28, 1882.)

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Buckner Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,  
Sole Manufacturers,  
527 First Street, San Francisco, Cal.

## A. L. OTT,

Manufacturing Jeweler & Diamond Setter,  
No. 13 TRINITY STREET.

Above Montgomery, bet. Bush and Sutter, San Francisco.

Designs and Estimates furnished on application.

## California Inventors

AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors far better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND

# FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

## FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager. - - - 461 Howard St., San Francisco

HOOKER & LAWRENCE, Gen'l Ag'ts. 145 Broadway, New York.

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

### "HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. | D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal. | J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

WE ARE MANUFACTURERS OF THE

'CHALLENGE,' 'STANFORD,' 'TULLOCK,' & 'ROLLER' FEEDERS,

And will furnish descriptive Catalogues and quote prices upon application.

## ELECTRIC DEVELOPMENT COMPANY.

### Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Transformers, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works, Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

### EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

The best advertising medium in their line in the world. Rates on application.

## New Almaden Quicksilver.

J. B. RANDOL,

Room 22, 320 Sansome St.,

San Francisco.

## FOR SALE.

A half interest in a gold bearing quartz mine, situated at Mokelumne Hill, Calaveras Co only. Two shafts sunk 60 and 110 feet, respectively; also a level run at the bottom of the 110 foot shaft about 100 feet. The ore body averaged three feet strong, and varied from \$10 to \$20 per ton. A tunnel was since run 300 feet, and a ledge has been struck which is four feet in width. This ore will yield \$6 to \$8 per ton. It is only a sixty feet from the surface. The object of selling the above named mine is to obtain some responsible party, with means, to sink a shaft 300 feet, and run several drifts along the ledge. The present owners ceased operations for want of working capital. None but princely aids need apply. The party purchasing must commence operations within thirty days from date of signing contract and work continuously and systematically till the shaft is completed. It is patented property. Address,

ABRAM SHEAR,

No. 506 Battery St., San Francisco, Cal.

## HORACE D. RANLETT, Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

NEWTON COPPER MINE, Calaveras Co., NEWTON COPPER MINE, Amador Co.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et al.

We also manufacture the Single-Jointed Giants.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

**JOSHUA HENDY MACHINE WORKS,**

39 to 51 Fremont St., San Francisco, Cal.

## HOSKIN'S

IMPROVED

ONE-JOINTED

## HYDRAULIC MACHINE.

The statement of Mr. Joshua Hendy that ANY STYLE of machine is an infringement on any style manufactured by him, he knows to be absolutely false. The Supreme Court of the United States on March 19th decided that the pretended patent for infringing, which he has for years been fleeing miners for royalty, is ABSOLUTELY VOID, with costs of suit to Hendy & Fisher. I am the inventor of all styles in use, and am prepared to fill orders to suit customers. Send for list of prices of Hydraulic Machinery. **R. HOSKIN, Empire Foundry, Marysville, Cal.**

Practical, Civil, Mechanical and  
Mining Engineering,

Surveying, Architecture, Drawing and Assaying.

723 Market Street,

The History Building, SAN FRANCISCO.

A. VAN OER NAILLEN, President.

Assaying of Ores, \$25; Bullion and Chlorination Assay,  
\$25; Blowpipe Assay, \$10 Full course of assaying, \$50.  
Send for circular.

**W. A. GOODYEAR,**

Civil and Mining Engineer,

MINING EXPERT AND GEOLOGIST.

Address "Business Box A," office of this paper, San Francisco.

**ROSS E. BROWNE,**

Mining and Hydraulic Engineer,

No. 307 Sansome St., SAN FRANCISCO.

BACK FILES OF THE MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

# \$1,000 CHALLENGE!

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

**THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.**

**ADAMS & CARTER, Agents Frue Vanning Machine Co.,**  
Room 7, No. 109 California Street, **SAN FRANCISCO, CAL.**

1850. — BUILDERS OF — 1888.

**MINING MACHINERY.**

GENERAL OFFICE AND WORKS:

127 First St., San Francisco, Cal., U. S. A.  
New York Office, 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 38 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other make, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPING MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

## THE HAZELTON BOILER

Is acknowledged by the most eminent Engineers in the country to be the greatest improvement that has ever been made in a Steam Generator.

**IT IS UNEQUALED FOR SAFETY, ECONOMY AND DURABILITY.**

A Saving in Fuel of at Least 20 per cent Guaranteed over any other form of Boiler.

SEND FOR CIRCULAR.

**PACIFIC IRON WORKS,**

Sole Manufacturers for the Pacific Coast, 127 FIRST ST., SAN FRANCISCO, CAL.

WM. H. TAYLOR, President.

R. S. MOORE, Superintendent.

L. R. MEAD, Secretary.

## RISDON IRON & LOCOMOTIVE WORKS

Location of Works, S. E. Cor. Beale and Howard Sts., San Francisco.

Manufacturers and Sole Agents for the Pacific Coast for

**HEINE SAFETY WATER TUBE BOILER.**

Has the Following Advantages:

**SAFETY, DURABILITY, ECONOMY, AND FACILITY OF INSPECTION AND REPAIRS.**  
60,000 Horse Power now in use.

Boilers can be seen working in San Francisco at Palace Hotel, Spring Valley Water Works Hueter Bros. & Co., California Jute Mills, and other places.

Guaranteed More Efficient than any other Boiler made.

**QUARTZ MILLS**—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.

**AIR COMPRESSORS**—Rope Power Transmission.

**HYDRAULIC PUMPING** and Hoisting Machinery.

**WROUGHT-IRON WATER PIPE** a Specialty. Note.—Have just completed order for 35 miles of 44-inch pipe of 4-inch iron for Spring Valley Water Works Company, San Francisco.

**SAW-MILL MACHINERY** of all kinds.

**STEAM ENGINES**—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.

**SOLE MANUFACTURERS** for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 60,000 horse power now in use.

**MACBETH PATENT STEEL-RIM PULLEYS**—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

**BUILDERS OF**

**REFRIGERATING MACHINERY** for Steamships, Breweries, and Cellars.

**WILSON'S PATENT GAS-PRODUCER.**

**STEAM BOILERS** of all descriptions.

**SUGAR MACHINERY**—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.

**STEAMSHIPS**—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.

Builders of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 80-stamp Mill for Quartz Mountain Mining Company.

Send for Circular and Price Lists.

## ATTENTION, GOLD MINERS!

WE ARE SELLING

**Silver-Plated Amalgamating Plates**

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,**

E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Our Silver Plated Plates have always proved as represented. We have been manufacturing them for 20 years, and use only the best Lake Superior Copper and Refined Silver. Comparing our plates with those of other manufacturers, after repeated tests, we can safely guarantee much better plates for the same money. Our plates are used by all the prominent mining men on the Pacific Coast. SEND FOR CIRCULAR.

## PERFECT PULLEYS

First Premium Awarded at Mechanics' Fair, 1884.

**CLOT & MEESE,**

Sole Licensed Manufacturers of the

**Medart Patent Wrought Rim Pulley**

For the States of California, Oregon and Nevada, and the Territories of Idaho, Washington, Montana, Wyoming, Utah and Arizona. Lightest, Strongest, Cheapest and Best Balanced Pulley in the World. Also Manufacturers of

**SHAFTING, HANGERS AND APPURTENANCES**

SEND FOR CIRCULAR AND PRICE LIST.

Nos. 129 & 131 Fremont Street,

San Francisco, Cal.

**ARE YOU GOING TO PUT UP MACHINERY OF ANY KIND?**

Are you going to make any change in machinery? Are you freighting by team or packing on mules? Do you want Pulleys on Shafting already up? If so, don't fail to look into the merits of

**THE DODGE PATENT INDEPENDENCE WOOD SEPARABLE OR SPLIT PULLEYS.**

They are the Lightest, Strongest, Best Balanced and Most Convenient Pulleys Made in the World.

Entirely new and original. Adapted to any power required. Time, trouble and money saved by using these pulleys.

Also Agent for the DODGE SYSTEM OF ROPE TRANSMISSION. Estimates furnished. Price List and Catalogues mailed free.

JOHN SIMONDS, Pacific Coast Agent, 509-513 Mission St., S. F.
